No. 101 Boston, Mass. May 1951

DEPARTMENT OF PATHOLOGY AND BACTERIOLOGY

A most important development in hospital medicine the world over, during the last sixty years, has been the steadily increasing role of hospital laboratories in facilitating the diagnosis of disease and the selection of therapeutic measures, and in serving as the centers of research activities on which medical progress depends. Since no one could possibly have foreseen the rapidity or degree of expansion needed, hospital laboratories of the last century were inevitably planned on a scale inadequate to the needs of today; and the Massachusetts General Hospital offers no exception to the general rule. As has been pointed out in brochures circulated to hoped-for donors, the Allen Street building, constructed in 1895 to cover all the laboratory needs of the entire hospital, was hopelessly inadequate within five years of its opening; and, as new wards were added, basements and attics all over our five acres of grounds were converted into laboratories for special purposes. Within the last few years plans were formulated for a building capacious enough to house both diagnostic and research laboratories, but the funds collected proved insufficient to carry out this double project, and a divorce of the two functions was granted to permit the erection of the Research Building on the far side of the compound. Some economies in its construction and the accretion of further financial aid now make it possible to hope that the denizens of the incredibly crowded Allen Street laboratories may in time attain new quarters, also. Plans now on paper again hold out promise of more space and improved arrangements of a sort that would permit development of our own research program and would, to the encouragement of the whole hospital staff, facilitate the reporting of material sent us for diagnostic work.

In the meantime we cling to the belief (not merely fostered by necessity but one which we have long held) that neither the daily job nor the production of research depends primarily upon *Lebensraum.* The current research activities of the staff include Dr. Castleman's work with Dr. David Kahn on muscle biopsies from hypertensive patients under a Massachusetts Commonwealth grant, Dr. Burt's study of histologic changes in the endocrines in neoplastic disease with reference to hormone therapy under a U. S. Public Service grant, Dr. Vickery's work on the pathology of the thyroid in conjunction with the Thyroid Clinic, Dr. Scully's collaboration with Dr. Morris on functioning ovarian tumors, and Dr. Kubik's study of the brain in carbon monoxide poisoning and his review, with the help of Dr. E. P. Richardson, of the brain abscess cases.

In the Bacteriology Laboratory, Dr. Dienes, in collaboration with the Arthritis Group, has continued his studies on the pleuropneumonia group of organisms and their role in genito-urinary infections. He is also studying the influence of cortisone on the development of specific immunity response, and attempts have been continued to produce autosensitization and to assess the possible role of this process in the collagen diseases by skin tests and serological studies.

Two new functions of the laboratory extend the scope of its services to the hospital. A department of Histochemistry has been instituted, manned by Dr. Agustin Roque of Havana, and the Cytology Laboratory, under Mrs. Graham, has now become an integral part of the Pathology organization.

The persistent vigor of the laboratory is attested by calls which its recent members have received to positions of importance in Pathology elsewhere. It is particularly gratifying to observe that an increasing number of those who receive their training here elect to remain in this professional field. Dr. Gall, now Professor of Pathology in the University at Cincinnati, has been joined in that city by Dr. Freiman and Dr. Capps. Dr. Sniffen is Pathologist at the Memorial Hospital in Worcester but still continues his association with this laboratory. Dr. Kulka is devoting his time to the pathology of joint disease with Dr. Bauer. Dr. Fennell is Assistant Professor of Pathology at the University of Tennessee in Memphis, Dr. MacMillan is associated with the Albany Medical College, and Dr. Buttles with the University of Vermont. Dr. Morgan leaves this summer to spend a year at Oxford University, England, in their cytochemical laboratory.

In these disturbed times it is pleasant to see the Pathology Laboratory as a positive, even if small, factor in international relations. Now working in it are doctors from the Philippines, New Zealand, Cuba, and Canada. A little reciprocity was realized in the invitations to Dr. Castleman to lecture at the University of Brazil in Rio de Janeiro last summer and, more recently, in Cuba.

Our relations with the Medical Examiner's Office have always been very cordial and cooperative. Recently the Trustees voted to appoint as Consultants to the laboratory Dr. William J. Brickley and Dr. Michael A. Luongo, one of our former residents. Their advice in medico-legal problems will be very helpful.

Tracy B. Mallory, M.D.,
Chief of Pathology and Bacteriology

Dr. Benjamin Castleman, Pathologist on our Staff, recently spent a week as Visiting Professor of Pathology at the University of Havana, under the auspices of the Cuban Ministry of Health. He gave a series of three lectures and conducted three clinicopathological conferences. Dr. Agustin Roque, a graduate of the University of Havana and a Research Fellow in Pathology in charge of our histochemical laboratory, accompanied Dr. and Mrs. Castleman and helped make their visit a thoroughly enjoyable one.

"Cuban hospitality is really something!" says Dr. Castleman.

* * *

Dr. Joseph C. Aub, Physician on our Staff and Director of the Medical Laboratories of the Collis P. Huntington Memorial Hospital of Harvard University, which laboratories are located at M.G.H., received the 1951 citation of the Massachusetts Division of the American Cancer Society.

The presentation of a bronze medal, for "distinguished service in cancer control", was made by Dr. Ernest M. Daland, President of the Massachusetts group and Visiting Surgeon at M.G.H. The award was made at the "kick-off" luncheon of the Society on April 2, when the 1951 drive for $530,166 for cancer research got off to a rousing start.

* * *

An interesting conference on aphasia, conducted by Dr. Edwin M. Cole, Director of the Language Clinic at Massachusetts General Hospital, was held in the Upper Out-Patient Amphitheatre on March 30. The conference was organized at the request of the Eastern Speech Association, which was meeting in Boston at that time. The MGH conference was addressed by Dr. Charles S. Kubik, Chief of our Neurology Service; Miss Ellen K. Donohue, Area Consultant in Aphasia to the Veterans Administration; Dr. Arthur L. Watkins, Chief of Physical Medicine at M.G.H.; Dr. Roland Gasser, Manager of Cushing VA Hospital; and Mrs. Samuel T. Orton, Director of the Graylyn Language Clinic of the Bowman-Gray School of Medicine in Winston-Salem, North Carolina. The meeting was well attended—about 200 being present. Many stimulating points were brought forward during the discussion.

The Board of Trustees, at their meetings on March 9 and 23, voted:

To accept with regret the resignation of Mrs. Elizabeth Howland Andrews from the Advisory Committee of the School of Nursing;
To accept the resignation of Dr. Robert B. Dodd, Assistant Anesthetist, effective April 1;
To promote Dr. Arthur B. French from Clinical and Research Fellow in Medicine to Assistant in Medicine;
To award the Dalton Scholarship of $1,000 to Dr. Charles H. DuToit for the year beginning September 1;
To grant leave of absence to Dr. John B. Stanbury, to conduct a series of studies on the problem of iodine deficiency in the Province of Mendoza, Argentina, from June 1 to September 1;
To grant Baker Memorial and Phillips House privileges to Dr. Solomon H. Rubin, who retired as Associate Physician to the Children's Medical Service in 1945;
To allow the Anesthesia Service four anesthetists from among researchers, who shall be given the title of Assistant Anesthetist;
To permit the use of B-8 for private patients, this to be the responsibility of the Psychiatric Service; professional fees may be charged and deposited in the Professional Fee Fund;
To allow the Children's Medical Service, on July 1, to take on six interns instead of the authorized five, it being understood that such an increase would be accompanied by a corresponding decrease in the authorized number of assistant residents.

To appoint:

Dr. Ransom J. Arthur as Intern on the Children's Medical Service, beginning July 1;
Dr. Anthony A. Arzimanoglou as an extra Assistant Resident in Orthopedic Surgery for one year, beginning July 1;
Dr. William Berenberg as Clinical Associate to the Children's Medical Service;
Dr. Richard D. Bush to the Courtesy Staff of Phillips House;
Dr. Evan Calkins as Chief Resident in Medicine, beginning January 1, 1952;
Dr. Leon I. Charash as Assistant Resident on the Children's Medical Service for one year, beginning October 1;
Dr. John C. Coolidge as Assistant in Psychiatry;
Dr. Shepard C. Ginandes as Intern on the Children's Medical Service, beginning July 1;
Dr. Marion T. Jenkins as Associate Anesthetist, beginning date indefinite;
Dr. Arthur S. Keats as Assistant Anesthetist, beginning October 1;
Dr. Jan J. Kukral as Assistant Resident in Anesthesia, beginning July 1;
Dr. Edward A. Mason as Assistant in Psychiatry;
Dr. Nils Normann as Assistant Anesthetist, beginning April 1;
Dr. Thomas C. Peebles as Intern on the Children's Medical Service, beginning July 1;
Dr. Stanley C. Ulick as Intern on the Children's Medical Service, beginning July 1;
Dr. Richard H. Watson as Intern on the Children's Medical Service, beginning July 1;

The following Medical Interns for the term beginning July 1:
Dr. Elizabeth F. Aub
Dr. Albert Damon
Dr. James B. Field
Dr. Gerald S. Foster
Dr. Brian Kiely
Dr. John H. Knowles
Dr. Stephen M. Krane
Dr. Avrum B. Organick
Dr. John C. Rowe
Dr. Madan M. Singh
Dr. William A. Tisdale
Dr. Elbert P. Tuttle

The following Surgical Interns for the term beginning July 1:
Dr. John F. Burke
Dr. Walter M. Haynes, Jr.
Dr. Clement A. Hiebert
Dr. Richard N. Kleaveland
Dr. George B. Murphy, Jr.
Dr. Frederick G. Shaffer
Dr. Jack E. Tetirick
Dr. Giles D. Toll

2179

At their meetings on March 14, 21, and 28, the General Executive Committee voted to promote the following from Assistant Resident to Resident in Medicine:

Dr. Nathaniel J. Ehrenkranz, effective July 1
Dr. Carl W. Gottschalk, effective July 1
Dr. William R. Owen, effective January 1, 1952
Dr. Walter T. St. Goar, effective January 1, 1952

The General Executive Committee also voted to appoint:

Dr. Pierre H. Blanchot as Clinical and Research Fellow in Medicine, assigned to Cardiology, for a period of ten months, effective as of January 1;
Dr. Charles M. Butters as Graduate Student Assistant in Surgery, effective immediately;
Dr. Leon I. Charash as Clinical Fellow to the Children's Medical Service for the period July 1 through September 30;
Dr. Charles V. duB. Lovell as Clinical Fellow in Psychiatry for six months, beginning July 1;
Dr. Ruth E. Reuting as Clinical and Research Fellow in Medicine, assigned to Cardiology, for the period March 1 to October 1;
Dr. Kathleen A. Swallow as Clinical and Research Fellow to the Children's Medical Service, effective March 1;
Dr. Consuelo K. Tagiuri as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. P. E. P. Vandevelde as Clinical and Research Fellow in Surgery, assigned to Gynecology, for the period of one year, beginning January 1, 1952;
Dr. Charles W. Wahl as Clinical Fellow in Psychiatry for a period of six months, beginning July 1.

* * *

THE ANEMIA CLINIC AND RELATED HEMATOLOGIC ACTIVITIES

Since its inception in the spring of 1948, the Anemia Clinic has continued to expand in several directions. The number of patients followed, and received for consultation, has increased severalfold, and, in fact, just about balances the capacity of the present available personnel—the doctors, the nurses, and the technicians. The able secretarial services contributed by Mrs. Genevieve Daley are matched by the efficient nursing help and scientific interest of Mrs. May Brannigan and her student nurses. During the past year Drs. Louis Kunian and Richard Howard, graduate students, have rendered valuable assistance, and, in turn, have rounded out their training in internal medicine. The clinic has been fortunate in a succession of residents from the Medical Service; Dr. Hugh Chaplin was followed by Dr. John Littlefield, and the latter's place is now filled by Dr. W. D. Sohier. It is hoped that this tradition will be continued by one of the residents interested in the problems which we encounter.

What are some of the questions that are put to us? At random, the following examples come to mind. A 24-year-old housewife is sent to us from Fall River for our opinion of her persistent anemia. She apparently had suffered repeated bouts of jaundice, abdominal pains, and persistent hemolytic anemia for several years, and six months previously was subjected to splenectomy, with no ensuing benefit. This was indeed a challenging problem, but the solution was sooner at hand than might have been predicted. The blood smear and quantitative data indicated a moderately severe anemia, with a macrocytic, normochromic erythrocyte picture, and with a normal reticulocyte level. The strong suspicion of pernicious anemia was readily corroborated by the megaloblastic bone marrow aspirate, and the demonstration of prompt response to liver extract "sewed up" the diagnosis of pernicious anemia with previous hemolytic crises. Less spectacular, however, is the more commonly referred patient, from one of our own clinics, bearing a name of Mediterranean origin, and sent to us for explanation of the patient's hypochromic anemia that has been utterly irresponsive to adequate doses of iron. Our approach to the diagnosis consisted of a high degree of suspiciousness of the Mediterranean origin of this anemia, followed by a demonstration of the *decreased* osmotic fragility (*increased* resistance) of the patient's erythrocytes. The failure to respond to iron can also be considered a significant diagnostic sign. Thus, this patient, one of from five to ten percent of our population of Italian origin, was classified as a case of mild Mediterranean anemia (a more inclusive term is Mediterranean hemopathic syndrome), the patient was reassured concerning the benign nature of the anemia with which she had come into this world, the referring physician was reacquainted with the condition, and the overburdened O.P.D. Pharmacy was relieved of dispensing to one more patient ferrous sulfate, 0.26, etc. Or, as illustrative of the principle that better treatment can follow more accurate diagnosis, is the six-year-old boy who was recently sent to us by a hospital in Worcester as an instance of that rare condition termed "pseudohemophilia", due to the patient's bleeding tendency of almost lifetime duration, his presumably normal number of platelets, and his markedly prolonged bleeding time. In the Anemia Clinic the latter finding was corroborated, but a careful examination of what were present of the child's platelets demonstrated qualitatively marked thrombopenia, a platelet count of only about 4,000 per cu. mm. (instead of a normal value of 500,000 to 1,000,000), an ample number of non-functioning megakaryocytes in the bone marrow—in short, all of the criteria for the diagnosis of idiopathic thrombopenic purpura. So, back to the Worcester hospital went the patient with our therapeutic recommendation for splenectomy.

The Anemia Clinic plays a most important role in the other hematologic activities throughout the hospital, from the points of view of consultative service, investigation, and teaching. For many years we have been engaged in the assay in patients with pernicious anemia of various purified liver extracts and in recent years we have studied the quantitative details of the therapeutic potency of vitamin B12. From our long-term quantitative studies has come the conclusion that the total hematopoietic activity of vitamin B12 alone involves far larger doses than were formerly considered adequate, and there still remains doubt whether even large amounts of this purified material is therapeutically equal in potency to commercial liver extract. Patients on this long-term therapeutic investigation are being followed in the clinic. For the past one year our interest in two forms of hemorrhagic states has been pursued actively and has begun to yield interesting results. With improved methods of estimation of blood platelets we have studied a number of cases of thrombopenic purpura and in two thoroughly investigated patients in clinical and hematologic relapse, some years after splenectomy, we have demonstrated dramatic rises in platelets from virtually none in the circulating blood to values as high as 2 million per cu. mm. of blood following the administration of ACTH and of cortisone. With omission of the hormone the higher platelet levels have been maintained from days to weeks before relapse set in. These observations suggest the great usefulness of this therapeutic aid in order to tide the purpuric patient over a bleeding or traumatic crisis, and also suggest the use of this method in preoperative preparation before splenectomy. The principle other hemorrhagic state under investigation is the bleeding time defect known in the literature as pseudohemophilia. In active collaboration with the members of the Gynecology Service we have been able to focus attention on a significant number of young women suffering from severe menorrhagia, and by a process of exclusion of uterine and of ovarian causes of the menorrhagia, and by exclusion of other hemorrhagic states, have been able to characterize these individuals as suffering from a bleeding time defect (pseudohemophilia). Some eight females and two males under study comprise a wealth of clinical material. It is noteworthy that the incidence of this bleeding time defect among patients in this hospital appears to be three or four times as great as the incidence of idiopathic thrombopenic purpura. This, of course, is an incidence that is weighted by the contributions of the Gynecology Service. It is planned to apply to the studies of these individuals all available methods for the elucidation of the pathogenesis and adequate treatment. Also, with the Blood Bank we have enjoyed the closest of cooperation and have under way a study of the integrity of platelets in transfused blood.

The demands for our consultative services throughout the hospital have increased manyfold; during the past one year we have received approximately 100 requests for consultation on the ward services alone.

Finally, there has been a great expansion of hematologic teaching throughout the hospital. To the house staff and to the clinical clerks we have rendered frequent informal instruction. Shortly after the arrival of each incoming group of clinical clerks on the Medical Service, every two months, instruction is furnished in practical hematologic techniques, and the teaching of fourth year students has been further extended to full-time work for one man per month, as "Medicine XIV, Hematology, Massachusetts General Hospital". Hematologic teaching has been included for several years in Dr. Adams's well-known course in internal medicine in the summer, and is to be included in the course in gynecology given by Dr. Meigs and his associates in the autumn.

The well-situated, but outgrown space long occupied by our activities in Medical Laboratory A on the ground floor of the Bulfinch Building has recently been a willing victim to the erection of the new Research Building and the consequent projected use of Medical Laboratory A by the Metabolic Ward. Our hematologic activities are now adequately housed on the fifth floor (or rather, the four and one-halfth floor) of the Domestic Building. There is no necessary correlation between the adequacy of laboratory space and the quality of medical investigation, but we hope that, despite this handicap, the activities of the hematologic group will continue at a productive level.

Bernard M. Jacobson, M.D.,
Head of Anemia Clinic

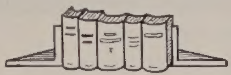
The Summer School of Clinical Pastoral Training, sponsored by the Institute of Pastoral Care, will begin its first session for 1951 at Massachusetts General Hospital on June 4 and end on July 13. The second session will run from July 16 through August 24. For information concerning the courses, address Chaplain James H. Burns, here at the hospital.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would remember to include that information.

The deadline date for each issue of The News is the 12th of the preceding month.

All requests for reprints are to go directly to the individual authors, and *not* to Treadwell Library nor to The News.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Department of Anesthesia, Massachusetts General Hospital.
M.G.H. News No. 99, 1-3.

Culver, G. A., Makel, H. P., and Beecher, H. K.
Frequency of aspiration of gastric contents by the lungs during anesthesia and surgery.
Ann. Surg. 133:289-292.

General Medicine

Leith, W., Graham, M. J., and Burrage, W. S.
The effect of ACTH on the immediate skin reaction and passive transfer test in man.
J. Allergy 22:99-105.

General Surgery

Taylor, G. W.
The management of regional lymph node metastases.
New York State J. Med. 51:376-378.

Laboratory Science

Klein, H. P.
Relation of coenzyme A to steroid and total lipid synthesis in yeast. (Abstract)
Federation Proc. 10:209.

Lever, W.F., Gurd, F. R. N., Uroma, E., Brown, R. K., Barnes, B. A., Schmid, K., and Schultz, E. L.
Chemical, clinical, and immunological studies on the products of human plasma fractionation. XL. Quantitative separation and determination of the protein components in small amounts of normal human plasma.
J. Clin. Investigation 30:99-111.

Lipmann, F., and DuToit, C. H.
The effect of thyroidectomy on the incorporation of C^{14}-labeled dl-alanine in rat liver slices. (Abstract)
In Abstracts of papers—119th Meeting, American Chemical Society, Washington, D.C., American Chemical Society, p. 30 C.

Niemeyer, H., Crane, R. K., Kennedy, E. P., and Lipmann, F.
Observations on respiration and phosphorylation with liver mitochondria of normal, hypo-, and hyperthyroid rats. (Abstract)
Federation Proc. 10:229.

Novelli, G. D., Gregory, J. D., Flynn, R. M., and Schmetz, F. J., Jr.
Structure of coenzyme A. (Abstract)
Federation Proc. 10:229.

Soodak, M.
An inhibition of the acetylation of arylamines in pigeon liver extracts by penicillin G and benzylpenicilloic acid. (Abstract)
In Abstracts of papers—119th Meeting, American Chemical Society, Washington, D.C., American Chemical Society, p. 18 C.

Tosteson, D. C., DeFriez, A. I. C., Abrams, M., Gottschalk, C. W., and Landis, E.M.
The effects of adrenalectomy, desoxycorticosterone acetate and increased fluid intake on intake of sodium chloride and bicarbonate by hypertensive and normal rats.
Am. J. Physiol. 164:369-379.

Neurology, Neurosurgery, and Psychiatry

Brazier, M. A. B.
A study of the electrical fields at the surface of the head.
Proc. 2d Internat. Electroenceph. Congress, 38-52.

Weisman, A. D., and Warthin, T. A.
The organization and function of a psychosomatic service in a general hospital.
Veterans Administration Information Bulletin, Jan., p. 5.

Ophthalmology

Cole, E. M.
Specific reading disability: A problem in integration and adaptation.
Am. J. Ophth. 34:226-232.

Oto-Laryngology

Schall, L. A., Lurie, M. H., and Kelemen, G.
Embryonic hearing organs after maternal rubella.
Laryngoscope 61:99-112.

Books

Talbott, J. H., Gottschalk, C. W., Henry, C. B., Blair, J. R., and Kolovos, E. R.
Report of Cold Injury Research Team. (Special report)
Washington, D.C., Medical Research and Development Board, Office of the Surgeon General, Department of the Army.

The Nurses' Alumnae Association announce May 15 as M.G.H. Night at the "Pops", Symphony Hall. Tickets—$2.50 per person or $12.50 per table for five—are on sale in the hospital corridors and in the Alumnae Office in Walcott House. Proceeds will be for the benefit of the Massachusetts General Hospital Nurses' Alumnae Association, Inc.

At a tea given in their honor on March 13, Dr. Clark welcomed the first student attendant nurses to affiliate with the Massachusetts General Hospital. These young women are students at the Household Nursing Association for Attendant Nursing, on Newbury Street. This was the first school for practical nursing in the country, established by Mrs. Katharine Shepard Dodge in 1912. The students are on duty in the Baker Memorial and in the Burnham Building. They are Mrs. Eleanor De Veau, Mrs. Marion Stidstone, and the Misses Phyllis Brophy, Evangeline Cyr, Bridget Dalton, Theresa Ricci, Josephine Scanlon, and Helen Woods.

The coordinator and instructor for the student attendants is Mrs. Ruby Johnson, a graduate of the University of Washington School of Nursing (Harborview Division), recently appointed Supervisor in the Baker Memorial. Mrs. Johnson was formerly coordinator with the Edison Technical School practical nurse students at the Doctors Hospital in Seattle, Washington.

Dr. Warren Whitford (*Or.* 1931), 22 Roosevelt Ave., Poughkeepsie, N. Y.

MASSACHUSETTS EYE & EAR INFIRMARY

The Infirmary regretfully accepted the resignation of Dr. Josiah E. Quincy as Associate Surgeon in Oto-Laryngology. Dr. Quincy continues his association with the Infirmary as a Consulting Surgeon.

Dr. Harrell Pierce, from the Wilmer Institute, Johns Hopkins Hospital, has come to the Infirmary for six months of study under Dr. Charles L. Schepens, Director of the Retina Service.

Dr. George T. Meurman, Professor of Oto-Laryngology at the University of Helsinki, Finland, visited the Infirmary during his stay in Boston from March 25 to April 2. Professor Meurman is touring United States medical centers. He is particularly interested in audiology and was, therefore, eager to see the work of the Mosher Laboratory.

Mrs. Eunice Wilson, Director of Social Service, and Miss Pauline Moor, Preschool Consultant for the Foundation for Vision, attended a four-day workshop, April 16-19, at the American Foundation for the Blind, New York City, on problems of blind children of preschool age. Participants worked on developing standards for professional workers in this field, on evaluating existing programs, considering needs for research, and outlining goals for future programs.

At the Annual Conference of the National Society for the Prevention of Blindness, held in New York City on March 28-30, the Infirmary was represented by Miss Eileen Gilmartin, instructor in nursing, Miss Oleta Allen, head nurse of the Eye Clinic, and Miss Mary Love of the Social Service Department.

The Conference was attended by doctors, nurses, social workers, representatives from state divisions of the blind and of government agencies, industry representatives, and interested lay people. Delegates came from all parts of the United States and from several foreign countries, allowing for a wide exchange of information on the diverse medical and social problems in the prevention of blindness.

The American Board Examinations in Oto-Laryngology will be held this year on May 1-5 in Richmond, Virginia. Dr. LeRoy A. Schall, Chief of Oto-Laryngology, and Dr. Werner Mueller, Director of the Mosher Laboratory, are on the examining board and will be in Virginia for the examinations.

The Parents' Group of the Winthrop Foundation Children met on April 6 at the Sewell Avenue Nursery School to hear Dr. Wilbert Pronovost of Boston University speak on "Speech in the public schools as related to the hard of hearing child".

The profits from the Annual Spring Rummage Sale conducted by the Ladies' Visiting Committee of the Infirmary amounted to more than $1200. As in past years, this money will be used for the benefit of the Infirmary. The sale was held on April 2 and 3 in Horticultural Hall.

BIOGLET

Dr. Wilma J. Canada, Assistant Resident in Pathology—born in Monaville, West Virginia, January 21, 1926; B.S. in Medical Technology, University of Kentucky, 1946; M.D., Duke University School of Medicine, 1949; Intern, Medical Service, Duke Hospital, 1950.

Miss Holbrook, our News editor, has suggested that a short note about my recent trip to Japan might be of some general interest.

Because of the large number of frostbite casualties in the current Korean conflict, the Surgeon General of the Army decided to send a frostbite research team to the Far East Command in an attempt to discover the reason for the large number of cases and to make recommendations for their treatment and management. The team consisted of three Army medical officers interested in various aspects of the problem and two civilian consultants. We were fortunate in having as the leader of the team Dr. John H. Talbott, formerly Assistant Physician at M.G.H. and now Professor of Medicine at the University of Buffalo. I was included as the other civilian.

We started off by visiting Percy Jones Army Hospital, Battle Creek, Michigan, where most of the frostbite evacuees in this country are hospitalized, and from there flew to San Francisco and Letterman Army Hospital. After various processings and many injections we flew via the Pacific air-lift to Japan. Fortunately, a record snowfall was accumulating at the time at Haneda Airport, Tokyo, so we stopped in Honolulu for a couple of days. Needless to say, the weather and the islands were lovely, and one couldn't help but feel sorry for the unfortunates back in Boston in the middle of the winter. We stopped at Wake Island just long enough to realize why the President and General MacArthur stayed there for such a short time, and in twelve hours we were in Tokyo.

Most of our time in Japan was spent in Osaka where all the frostbite cases were assembled and we had the opportunity to see and examine many hundreds of them. We studied in detail a smaller group, started them on various types of treatment, and were able to follow them personally for several weeks. This latter group is to be evacuated to this country and followed for one or more years.

The morale of the casualties was strikingly high, and one could not talk with them without soon realizing that they had been fighting under the most difficult circumstances and that they had done a magnificent job—facts too poorly known and appreciated here at home. We were also impressed by the type of medical care the men received and the caliber of the medical officers. The group in charge of the frostbite cases could not have been more interested in their work. The reports of needless amputations have been much exaggerated, and any that did occur came very early in the winter when frostbite was first encountered. The degree of recovery following frostbite is amazing and in only a small percentage of cases has any type of surgery been required. There can be no doubt that frostbite is a medical disease.

We found Osaka and the surrounding area much more interesting than Tokyo, and were able to visit the shrine and university cities of Kyoto and Nara. We all spent a good many yen shopping for presents for our wives in Kyoto. Before returning to Tokyo we visited Hiroshima and the Atomic Bomb Casualty Commission installation there. Hiroshima is almost completely rebuilt and repopulated, and shows few scars of the catastrophe that struck it. The hypocenter is a miniature carnival and we, like the other tourists, purchased pieces of irradiated and heat-scarred tile.

The trip back to this country was also by air and is best remembered as a succession of in-flight box lunches which must include a few ripe olives for breakfast—usually consumed around 4 A.M.

In the two months we had had a most pleasant, interesting, and instructive trip and one that will not soon be forgotten. I only hope that before I leave the M.G.H. at least one case of frostbite will come to the Emergency Ward.

Carl W. Gottschalk, M.D.,
Assistant Resident in Medicine

The Ladies' Visiting Committee realized the nice sum of $804.60 from their sale of the old Meissen ware onion pattern and Wedgwood china which had formerly been used in the hospital. The Ladies' recommendation that the proceeds from their sale be deposited to the credit of the Archives Department received the approval of our Board of Trustees. We of the Archives are most grateful for the donation.

Before the sale, the Ladies selected three pieces of the china—a platter, a soup dish, and a gravy-boat— for our Archives collection of hospital memorabilia.

Ever since we first saw it, several years ago, we have been interested in the Charles Street Jail—solely because of its architecture, we hasten to add, lest our attraction to the building be held suspect; and when we became associated with M.G.H. and were within daily sight of the structure, we found our interest steadily waxing stronger.

On one point, however, we were completely baffled. Why was it that we felt a Bulfinch influence in this building, when its cross-like massed effects should in no way suggest the H-shaped horizontal edifices with their pillared porticoes, so typical of much of Bulfinch's work? Besides, Bulfinch had died four years before the ground was even broken for the jail. But the impression persisted, and in an attempt to find a possible explanation we visited the Boston Athenaeum one day and ran upon some interesting information, even though we failed to convince ourselves that our findings furnished a satisfactory foundation for our impression. For months we have wanted to pass these data on to you, but felt there was really no logical reason to be discussing the jail, except for the frail excuse that it is within our immediate environs, nor were we at all sure that anybody else shared our interest in the building. Now, however, when the possibility of the hospital's acquiring the jail is under discussion we are seizing upon the opportunity to tell you what we discovered regarding the jail's architect.

From *Boston after Bulfinch,* a book by Walter H. Kilham (1946) in the Athenaeum, we found that Gridley J. F. Bryant was the designer of the jail. He also planned many other buildings in and near Boston, including our City Hall, the original City Hospital, part of the old Parker House, our State Prison, the penal institution on Deer Island, the city halls in Lynn and Gloucester, many schools, and over 100 buildings in the burnt district after the great fire in Boston.

Bryant was born in Boston in 1816. He received his training in architecture in the office of Alexander Parris— and there lies the frail explanation, perhaps, as to why we think of Bulfinch when we study the jail, for it was Alexander Parris who acted as Bulfinch's superintendent during the erection of our Bulfinch Building. Bryant, like Bulfinch, made use of granite and other materials that were at hand. Kilham says it was Bryant who stabilized the architecture of the Back Bay and the business quarter in Boston at the rebuilding after the fire. He was a pioneer in the idea of fireproofing, and proved the efficacy of his technique when one of his buildings successfully cut off a spreading fire on Milk Street.

From the Athenaeum we went to the jail itself and had a very pleasant visit, although we were disappointed to learn that no detailed account of the history of the jail was available there. However, the Jail Officer at the desk took us out to see the metal tablet on the outside wall of the original building—now in the south yard. Among other data, the tablet says that the jail was "commenced" on October 20, 1848, that Josiah Quincy, Jr. was Mayor of Boston, and that the building was designed by Louis Dwight and Gridley J. F. Bryant, with Bryant as architect—the Bryant who got his training in the office of Parris, who was Bulfinch's superintendent of construction here at M.G.H.

A genealogical chart would show no closer professional relationship between Bulfinch and Bryant than that of cousins once or twice removed—sufficiently removed in this instance, one might conclude, to obviate any real kinship. However, right or wrong, we still feel that the spirit of Bulfinch, through Parris, may have breathed upon the hand of Bryant as he drew his plans for the Charles Street Jail, for the Bulfinch impression still remains, though wraith-like and elusive.

* * *

Brief bits:—

Dr. Cecil F. Baxter (*WS* 1944) paid us a surprise visit not long ago. Everybody was delighted to see him. For the first time we learned about his association with many interesting and exciting activities on both sides of the Atlantic since he left M.G.H. When we heard the story we chid him for not having kept us informed during this period. He says he'll do better in the future. We wonder—and hope. His address is 2025 Shore Blvd., Astoria, Long Island.

Dr. Walter S. Burrage, Head of our Allergy Clinic, was elected Vice President of the Aesculapian Club on January 13. Also, he was Moderator at the American College of Physicians' panel on Bacterial Allergy in St. Louis on April 12.

Dr. Means received this very interesting letter from Dr. Hugh Chaplin, Jr. (*M* 1948), written from 28A Keswick Road, East Putney, London SW 15, England.

I won't bore you with details of our crossing and the first few weeks over here. I have written all this to Bob Berg and to Nan and Walt St. Goar. Suffice it to say that we found traveling with a 2½-year-old child quite a different matter from our previous trip in 1947 when we were on our own and out for pleasure only. We weathered the rough seas satisfactorily, however, and after a week of misery in a cold, damp, dreadfully respectable London hotel we moved into our present flat—the ground floor of a Victorian house, with a pleasant garden in back, and an extraordinary collection of heterogeneous bits of furniture. If you can picture it, the "reception room" sports a mixed collection of traditional family portraits, mid-19th century caricatures, and five Van Gogh reproductions. The dining room is replete with grandfather clock, old wood cuts, refectory table, and a somewhat battered tapestry. In other words, it is a quaint old place, with inadequate heating,

No. 32 in a series of Staff photographs
Dr. Charles L. Clay, First Assistant Director

plumbing, and kitchen facilities, but with great compensations in atmosphere, size, and location, and we are really very happily settled at last. Our little English car (we finally decided on a Hillman) is in hand, and having finally acquired a nursemaid to help around the house and give us some freedom from our beloved little Kate, we feel ready to launch on many pleasant explorations of this lovable, shabby old city and the rolling country that surrounds it.

Thus far, our recreation has been limited by the weather, which continues to be very cold, damp, foggy, and windy. We have been to the theatre several times, and managed to get to one of the final performances of the opera season at Covent Garden two weeks ago. My, what an appealing old place that is, with its ornate decorations, its colorful audience, and its beautifully trained company.

One extremely pleasant evening was spent with the Bywaterses, who very kindly invited us to their home for dinner. They are so very appreciative of the hospitality shown them in the U.S.A., and they couldn't have been more cordial and generous to us. They even went so far as to serve us *ham*, a rare delicacy over here now—this one being a canned product Dr. Bywaters had brought back with him from the States.

I don't know whether you have ever actually visited the Hammersmith Hospital, but when I first saw it I confess to a brief moment of uncertainty at the rashness of my having come all the way to England. It is certainly an ancient old place, most unprepossessing on the outside, and pretty grim and drafty on the inside. But any despair I may have experienced vanished very quickly, for the unit with which I am working couldn't be more to my liking. Mollison himself is charming, stimulating, extremely competent, and most generous with his time as a teacher and a friend. The group is small enough (only five of us) so that I really feel intimately in touch with what is going on. I am sure I can acquire much experience in techniques and new experimental approaches in the field of hematology while I am here. Also, I am not losing complete touch with clinical medicine, since I go on ward rounds with Dr. McMichael once weekly and attend the medical staff rounds every Wednesday.

Mollison has been most kind in including me in all general research functions which are going on here in London. In particular, he has arranged for me to attend all the meetings of the Royal Society of Medicine (research division) and the Medical Research Society. The latter is particularly good fun, since it is held each time at a different hospital. The first meeting was at St. Thomas's, and last night another one at Guy's. The membership of this group is a most impressive one. I have been privileged to meet and chat with Dr. Pickering, Dr. Grant, Dr. Sharpey-Schaffer, and Dr. Himsworth. All these people speak most happily of their visits in America and are most cordial and friendly to me, which has greatly enriched my time spent here.

Alice and I plan to be in Paris for four days over Easter, and are praying that spring may have come a little closer by then. Our major vacation will be a four- to five-weeks' motor trip through France, Switzerland, Italy, and possibly Austria during May and June. We also plan to spend a week with close friends of mine in Scotland during early October, and there are plans for many weekend jaunts to such spots as Windsor, Oxford, Cambridge, the country areas of Kent, Surrey, Cornwall, and many other spots.

As you can see, we are at last well-settled and are finding this year a most fascinating and pleasant one. The rationing, the cold, and the other minor disadvantages are being well-compensated by the new people we are meeting and the experiences we are having. We both miss Boston dreadfully, and I cannot put into words how hard it is for me to realize that my residency at the M.G.H. is actually over. All the time spent in that grand place was unfailingly happy for me, and my appreciation to all those with whom I had the pleasure to work is unbounded. Please give my warmest regards to everyone there.

In the March issue of The News we published a letter from Dr. Anthony T. Licciardello (*M* 1948) saying he had just received orders to report at Fort Devens, Ayer, Mass. Later, from the U. S. Army Hospital at Devens came this letter.

I am now here, working as a ward officer on the Medical Service, and can be reached by mail at the above address or at 60 Haverhill Street, Lawrence, Mass.

There is not a great deal of interest to report since I have been in the Army only six days at this writing. I arrived here in the midst of the flu epidemic and my duties have largely been confined to treating same, but when this present state subsides I shall be in charge of a general medical ward. As far as I can tell, this should represent a reasonably good job—for the Army.

We are living in a rented 4-room cottage in Shaker Village, Harvard, Mass. It is pleasant, even if somewhat isolated, and should be perfect if we are here to enjoy the spring and summer. Our house is 125 years old. It was the tailor shop in the original Shaker community here.

I am looking forward to meeting many of my MGH colleagues in the Service and following the rest in The News.

With a hope for more normal times.

This letter from Dr. Benjamin F. Miller (*assoc. p. CM* 1949-51) carries the salutation "Dear Colleagues" and reads:

I am leaving the General to take a position at the Peter Bent Brigham, where my work will be to coordinate the research on the kidney transplantation project there.

It's been a perfectly wonderful stay at the M.G.H., and it offered me an exceptional opportunity to get back into research again while convalescing from a long siege of Boeck's sarcoid. With Dr. Chester Jones keeping an eye on me from the hospital end and adjusting my work hours, and Dr. Allan Butler very kindly making arrangements for my research in his laboratory, I have been a very lucky patient and research worker.

With the help of Drs. Alexander Leaf, Audley Mamby, and Zelma Miller I have been able to complete clearance studies evaluating both allantoin and endogenous creatinine as measures of glomerular filtration rate in the diseased kidney. Also, Mrs. Miller and I have shown that a chemical method for the specific estimation of serum creatinine can be substituted for the more exacting enzymatic method.

THE NEWS

No. 102 Boston, Mass. JUNE 1951

RESEARCH BUILDING DEDICATION

Our new Research Building was formally opened on May 16. Exercises in honor of the event covered the entire day from 9 A.M. through the afternoon. The program of the scientific lectures, which took place in the Moseley Rotunda during the morning, was given in the April issue of THE NEWS. Following these lectures, a buffet luncheon was served on the Bulfinch Lawn, during which time the Harvard Glee Club sang several of their best songs in their usual excellent style.

The afternoon exercises, on the Lawn, began at 2:30. Mr. Francis C. Gray, Chairman of our Board of Trustees, greeted the guests and introduced the speakers. One very important interpolation made by Mr. Gray was the announcement that the hospital has at last acquired from the City of Boston the deed to that part of Fruit Street extending from North Grove to Blossom.

The first speaker was Dr. Francis P. McCarthy, a member of our Board of Trustees. Dr. McCarthy, substituting for Governor Dever who was unable to attend, spoke of the founding of the hospital. Then followed the addresses scheduled for the afternoon.

The Research Building was open for inspection all day. Guides were on hand to take groups through the building, and all the members of the Research Building personnel were most gracious and eager to explain the functions of the various pieces of equipment. The huge bowls of ice-cold punch on each floor were much appreciated, for the temperature had risen to a sizzling 91° in the shade by early afternoon.

Because we felt that many of you would appreciate having copies of the afternoon addresses for your files, we decided to publish the speeches in THE NEWS. We include in this issue as many as space allows, and will publish the rest in the next number.

Sir Charles R. Harington, Director of the National Institute for Medical Research in England, was the principal speaker, therefore we give you his address first.

A book has recently been published by the English historian A. L. Rowse, entitled *The England of Elizabeth*. Not unnaturally, this has been something of a best-seller at home because the Elizabethan Age is one to which many of us in England look back to as a golden period of our history. We think of it in this way because for us it was an age of expansion, of victorious war, and of intellectual and literary activity unparalleled in our development as a nation. Rowse, however, puts the emphasis on a different point. He says, "The final achievement of the Elizabethan Age, its most enduring monument—the decisive factor in the history of the modern world—is the English expansion overseas, the fact that North America is inhabited by English-speaking stock. What could be of more immediate impact upon every English man and woman alive today, for to it we owe our very survival twice over in the course of one generation."

This was to me a new and very impressive thought, and the more that I have dwelt upon it the more I have felt its relevance to the present time, when we forget all the difficulties and misunderstandings that have arisen between us during our histories in the knowledge that now we stand or fall together. It makes us realize that the ties that unite us today are much more than the manifestation of the instinct of self-preservation in those facing a common danger; they are indeed the natural and proper outcome of community in the reality as well as the sentiment of tradition.

Community of tradition between nations, however, does not and should not imply identity of thought. Ethical and political ideals will differ and each nation will evolve its own civilization according to its own genius. Indeed, the one respect in which the sharing of a common language between nations may be a danger is that it can lead to forgetfulness of this fact. However much national civilizations may diverge there remain, nevertheless, some realms of human activity in which they can share with undivided mind; of these the greatest should be the pursuit of knowledge. The fact that this cannot be said to be truly so is a sad reflection on the failure of the human race today. There is, however, one branch of the pursuit of knowledge that is, in the manifestations that we are thinking of today, free from all considerations of race, religion, or politics, and that is medical research. I am encouraged to think that you share the thoughts I have expressed by the fact that you have done me the great honor of inviting me to speak to you today, at the dedication of an institute which is destined to extend your own scope for medical investigation. There is, of course, a more particular ground on which I am glad to take part in this occasion, and that is the link that has existed between this hospital and University College Hospital in London, in the Medical School of which I worked for nearly twenty years and to which I owe more than I can ever express. When I speak of this link I am not only thinking of the discovery of ether anaesthesia, though this was the beginning of it. It is of this beginning that we are both constantly reminded by the bells, cast in duplicate from the railings of the operating theatre at University College Hospital where Liston did the first operation under ether in England, which now stand in the Board Rooms of the two institutions. (In your case, I believe the bell is rung at the celebrations of the ether anniversary; in ours, who were only the followers of your discovery, the bell, in my experience, properly remains mute.) [For a detailed story of the bells, *see* Nos. 44 and 47 of your M.G.H. NEWS.] I am thinking now rather of a more subtle link in what seems to me to be a community of outlook between the two hospitals. In both, the investigative aspects of medical work have been kept in the forefront. In both, the great names that we think of are those of pioneers, interested not only in the care of their patients but in the scientific advance of medicine.

You will have in mind the doctors who began the work of your hospital and those later members of the staff, such as Reginald H. Fitz, F. C. Shattuck, and James Homer Wright who, by their influence and their personal contributions kept interest in research in the forefront. Then, with the modern establishment of clinical research on a systematic basis, in which so great a part was played by David L. Edsall, you can dwell with pride on the use that has been made of the greater opportunities for investigation by such men as Means, Newburgh, Palmer, Gamble, Aub, and Bauer. These men and many others who have worked and are still working here are known throughout the world, and it is largely on their contributions to medical science that the international reputation of your hospital rests.

We, in our turn, remember Liston himself, eager to try ether anaesthesia as soon as he heard of it, albeit with a cynical aside before the experiment about "this Yankee dodge", and receptive enough to be so overcome with enthusiasm at the first successful result that he could hardly stammer the words, "This Yankee dodge beats mesmerism hollow." We think also of Sidney Ringer, of Victor Horsley, of Rose Bradford, and in more recent years of T. R. Elliott, A. E. Boycott, and Thomas Lewis, all of them men whose names will live in the history of natural science as well as medicine.

In my last few sentences I have found myself speaking of University College Hospital in a way that I have no right to do, as if I still belonged to it. It has come naturally to me to do so because of the affection that I have for that institution and the debt that I owe to it. Perhaps I may be allowed a brief personal reminiscence to amplify this, since it is relevant to what I wish to say to you. In the early days of my work on the thyroid I found that I needed what seemed at that time a large sum of money to make any progress. With some diffidence I approached two or three senior members of the staff and asked for their support. Although I was then a young and relatively untried research worker the support was given, and without any hesitation whatever the governing body granted me the money that I needed. Now, there were at that time few universities and probably no other medical school in my country where that could have happened; I do believe, however, that it would have happened here. The whole thing has meant so much to me that I could hardly say more to show you my admiration for the way in which your institution has made it possible for your men to advance medical research. So you will see that it is not presumption which leads me to speak as if U. C. H. and M. G. H. were sister institutions, but a conviction that they share the ideals that seem to me to matter.

For nearly nine years now it has been my task to direct the largest institute for medical research in Great Britain, and indeed one of the largest in the world, and this experience gives one a rather different view of the problem of medical research as a whole. In this country a great part of the most active medical research is done in large institutes that form parts of or are closely attached to hospitals; in Great Britain the plan is different. There, so far at least as the Medical Research Council is concerned, and that means nowadays the greater part of the medical research in the country, an effort has been made to build up one central institute that shall have the staff and facilities to undertake investigations in any of the laboratory aspects of the subject, whilst clinical research is done for the most part in small units established by the Council in teaching hospitals. The central institute has no direct responsibility for clinical work, although naturally clinical contacts are available for the development of discoveries made in the laboratories; and in occasional special cases, such as the current research on the common cold, medical members of the institute staff may themselves undertake a clinical investigation.

I think it is impossible to say which is the better of these two systems. Each has its evident virtues and defects; there are those in England who think that you have chosen the better way, and I dare say the converse may be true. In favour of the large institute is the fact that the field of laboratory research in medicine is now so wide that the help of almost any branch of science may be required. For this reason the facilities for covering the field adequately can more readily be provided in a large institute staffed by both medical and non-medical scientists, and it is perhaps easier for these men and women to work together on a footing of equality if the institution is not closely concerned with clinical work. On the other hand, there is always the danger that the laboratory research institute becomes for the individual worker an ivory tower in which he is completely divorced from reality and loses himself in abstractions. The hospital research institute has the great advantage in this respect, for the workers can never lose sight of the urgent medical problems; their chief danger indeed is that their sense of urgency may cause them to take too short a view; they will probably also be less well provided with facilities to extend their work in any direction in which it may lead them.

Probably the real answer is that one system will suit the natural genius of one country better than another. The fact that in this country and in England the evolution of medical research is following different lines need be no more than an example of those natural divergencies of nations which I have spoken of. In any case, by your record you have shown that the way you have chosen is without any doubt a good one.

After all, the things that really matter are, first and foremost, the desire of men and women to do the work of medical research, and, secondly, the convictions and the policy of those on whom they depend for their living and their opportunity. We who work for the Medical Research Council in England are indeed fortunate in the wisdom with which their policy was framed and has been maintained. The policy is summarized in a few sentences that I would like to quote from the first report that they issued in 1914:

"The object of the research is the extension of medical knowledge with the view of increasing our powers of preserving health and preventing or combating disease. But otherwise than that, this is to be the guiding aim: The actual field of research is not limited and is to be wide enough to include, so far as may from time to time be found desirable, all researches bearing on health or disease, whether or not such researches have any direct or immediate bearing on any particular disease or class of diseases, provided that they are judged to be useful in promoting the attainment of the above object."

It is comparatively easy to live up to the ideals of such a charter of freedom in an institute for laboratory research; it is not so easy, perhaps, in a hospital. But I know from my own experience that it can be done at home and you have shown that it can be done here. Indeed, you can match the policy of the Medical Research Council with your determination, in face of competing claims, to give first priority to a Research Building, in the belief that a firm and unshakable anchor in science is the first and necessary step in the advance of medicine.

Today, in the opening of this fine new building, we have, in impressive form, the physical evidence of this faith and determination. The laboratories and equipment will provide the greater scope that is demanded by the ever-increasing complexity of medical research. It is only too easy for research workers to feel frustration in the thought that all the simple problems have been solved and that as time goes on they become more and more bogged in complexities. This is not a true thought; complexities resolve themselves when the new light is seen, and now as ever the new light will shine for those with trained and receptive minds. It is true of modern research, however, that a new idea is likely to require for its development wider scientific and technical resources. These you have now provided, and in the knowledge that there is no lack of men to make good use of them you may indeed feel that the future is full of promise.

The opening of this institute is no new departure for you; it falls naturally into the pattern of your development. It is, however, a landmark in the history of an institution from which the world has learned to expect much. It marks a great stride along the road that you have planned out for yourselves—a road that will lead, as it has led in the past, to a new knowledge that will benefit the sick not only in your own famous hospital but throughout the world. May your future journey by this road be a long and a happy adventure. This will be the wish for you today of colleagues of all nations who have the true progress of medicine at heart.

Dr. George P. Berry, Dean of the Harvard Medical School, spoke first of the close family relationship that has existed through the years between the Harvard Medical School and the Massachusetts General Hospital, and then went on to show the applicability of the ancient Chinese proverb "Ask and ye shall receive, seek and ye shall find, knock and it shall be opened unto you" to the research fields of today. We regret that we cannot give you the text of this address. Dean Berry spoke extemporaneously.

A transcription of the speech given by Dr. James R. Killian, Jr., President of Massachusetts Institute of Technology, follows.

THE GOOD NEIGHBOR POLICY IN RESEARCH

I speak today not as a specialist, which I am not, but as a layman—a layman whose chief qualification is my enthusiasm and admiration for this great medical institution and the men and women who make it so. In this sense I am an expert, with my *bona fides* well attested.

I am something of an expert in another sense. As the executive officer of a sister institution just across the river, I know how good a neighbor the Massachusetts General Hospital is, and how effective are the relationships it has developed with its neighbors. I know from experience how powerful has been the good neighbor policy which prevails in this community and which links together in close bonds our scientific and educational institutions. The physiologists have a name for it—synergism, or working together. We have here in this community a synergistic relationship among our institutions and communities of workers, a commonwealth of science and research, prodigious in its potential for good.

For these reasons the research laboratory which you dedicate today strengthens not only the Massachusetts General Hospital but all of its neighbors, and we in its sister institutions can rejoice with you in its availability.

Many other reasons lead me to share in this program with enthusiasm and with faith. I believe, for example, that in our hospitals and research institutions we are in the midst of scientific advances unprecedented in their promise for human welfare. The swift scientific advance which we are witnessing today represents a crescendo in the immense acceleration of scientific understanding which has been occurring during the past half century or more. Roentgen discovered X-rays in 1895; Becquerel, radioactivity in 1896; the Curies, radium in 1898; while J. J. Thompson in 1897 laid the basis for our modern theories of atomic structure; and Einstein in 1905 published his relativity theory. As a result of these great discoveries, the twentieth century has witnessed the opening up of wholly new interpretations of nature not previously dreampt of, a new era of scientific advance when scientific knowledge is increasing, as we say, exponentially. More has happened, in fact, in physical science in the past decade than occurred in the preceding half century.

Not the least of the scientific achievements of recent years has been the interlocking of the basic sciences in biological and medical research, the application of physics and chemistry and technology to the life sciences, including medicine, with a consequent deeper penetration into the structure of living matter. This mobilization of all of the sciences in combatting disease and defending health has brought a new era in the field of medicine, and as a result the medical sciences, too, are now experiencing a floodtide of advance.

Along with the integration and mobilization of all of the sciences in medical research has come the fruitful partnership of the investigator, the clinician, and the practising physician. This triple alliance, I venture to suggest, is analogous to the alliance that we find in the non-medical sciences as they range from theoretical investigations in the laboratory through engineering in all of its applied ramifications. The position of the research hospital, in fact, is not essentially different in its research aspects from that of the institute of technology. These institutions have discovered and demonstrated that engineering and the applied sciences, which are analogous to medicine, flourish best when they are taught and developed in association with basic science; that applied and basic science interact upon each other to the marked advantages of both. This does not mean that pure or basic science is in any way inferior to the applied point of view, or that the applied point of view should be dominated by the pure science attitude. It means, rather, that both can exist in productive good neighborliness and that when they do so, each becomes stronger.

This desire to cultivate the whole spectrum of health science from theoretical to applied is embraced by this institution, and this research laboratory is evidence of this philosophical acceptance of the good neighbor policy in research.

I would draw another concept from the field of engineering in commenting upon the broad range of activities of this hospital. I refer to the fruitful systems concept, the fact that many problems can best be dealt with and solved not by dealing with component parts but rather with the functioning and dynamic aspects of a system as a whole, as, for example, a communications or a telephone system. The system has characteristics of its own and a logic of its own that need to be studied. Incidentally, the communications engineers, animated by the concepts of cybernetics, are giving increasing attention to the human being as a component of a given system, and this is bringing about an interesting new relationship between the engineer, the physiologist, the psychologist, and even the social scientist. This systems approach, which is being applied in so many interesting ways as, for example, to military problems, is greatly facilitated by the presence of the whole spectrum of activity from pure to applied in a given group. It would seem to this observer that this hospital, with its wide range of research and clinical interests, and with its close relationships with a wide variety of other research institutions, is in a particularly happy position to exploit not only research on components of a given medical problem but research on systems. It means in its broadest sense that this hospital, as I know it is, can deal with health on the widest possible environmental basis, that it can take the ecological approach as well as the approach to specialized problems. It means that it can relate the health of the individual to the health of the community and help to better both.

I would suggest that the privately controlled voluntary hospital is peculiarly well qualified to develop this broader attack. It has led the way in bringing into fruitful partnership the investigator, the clinician, and the practising physician. I wonder if we realize how fortunate we are in having evolved the form of hospital where the care of patients is associated with creative advances in medicine. Out of the integration of the basic sciences in medical research and through the mechanism of our special kinds of hospitals, is coming the flood-tide of medical discovery of which I have spoken. As illustrative of this powerful attack on disease through the collaboration of academic scientists, doctors, and industry, let me cite the application of techniques of atomic physics to problems of biology and health; the swift developments in chemical therapy and the antibiotics; and the growing understanding of the true role of hormones accompanied by the production of the astonishing drugs of the chemical family of steroids.

These hormones and the immense effort under way to produce them in adequate amounts are fine examples of the effective team play between the pure scientists in universities, the hospital clinicians, and industry.

In institutions such as the one with which I am associated, it has been interesting to observe the rapid growth of interest on the part of scientists and engineers in medical problems in recent years. Although they have no medical schools, they are engaged extensively in work on medical problems or on research which ultimately may contribute importantly to medicine. The field of medical chemistry, for example, or biochemistry, if you will, either pursued under the aegis of biology or under the aegis of chemistry, itself, is vigorously productive at the present time. The biologists, of course, have long been deeply involved in problems basic to medicine, but this interest has been enormously amplified as the results have proved steadily more exciting. This has led in recent years to the desire on the part of a growing number of young physicians to acquire the quantitative techniques developed by the pure biologist in order better to equip himself for research. A period of postdoctoral study in biology is being sought by increasing numbers of young M.D.'s, and just recently one of the foundations interested in medical research has made a large grant to a biology department to enable it to extend its postdoctoral training of M.D.'s.

The physicists are interested in further applying the resources of nuclear physics to biological and physical problems, and the engineers, notably the electrical engineers, have joined forces with the physician in applying new high-voltage techniques to the treatment of malignancies. Then, in another area we find ourselves engaged in a new program of study designed to train a new type of engineer, a combination of the chemical engineer and the biologist, who can be useful in dealing with the complex problems in the pharmaceutical industry resulting from the production requirements of the antibiotics and chemical drugs. In these and other ways medicine has metastasized through our non-medical, scientific institutions, and I am sure that we will find it increasingly drawing upon the resources of science and technology to further its own development. I see this new laboratory as a center of stimulation and coordination of this growing system of research on medical problems.

The dedication of this laboratory prompts two other observations. The first is that research institutions must squarely face the problem of how to give adequate incentives and rewards to the basic scientist, the free investigator who prefers to follow no foreordained objective. The problem of the independent investigator is made more difficult by the greater availability of funds for programmatic and development research.

The funds which are easy to obtain today are those to support research directed toward some specified end; the hardest funds to obtain are fluid funds for the support of basic research as an end in itself. What we need if science is really to flourish are enough free funds to support free minds—not minds working toward ends foreordained but minds following the strange, unorthodox, and unforeseen turns of the creative imagination.

Our research and educational institutions also must recognize the danger of the incomplete grant-in-aid, the gift which encourages taking on a new project but does not cover its full cost. Government grants which do not cover indirect expense have been increasing and to the extent that they have increased, they have laid an additional burden of expense on the non-government institutions receiving them. If the government is to maintain, as I think it should, a trustee relationship to our research institutions, it should not weaken them by encouraging new research through making grants that do not adequately cover the indirect costs of this research.

My second observation is that the aggressive exploitation of research in the field of medicine may, as many medical men have pointed out, be the chief factor in retarding the mounting costs of medical services. We have seen research bring a number of diseases under control, as for example, the effective use of antibiotics in controlling diphtheria and pneumonia. This has reduced the load on our hospitals.

In this direction may lie the remedy for the mounting demand for more hospital beds. Without this kind of advance, our hospitals are handicapped in embracing opportunities such as post-operative check-ups and other types of extension services. Without this kind of advance the cost of hospital care might force us ultimately to abandon our voluntary hospital system. I believe that this would be a set-back to medical advance. The best way to provide the maximum amount of medical care to all of our people is to make steady progress through our hospitals and medical schools in keeping them well. It may well be, as physicians have pointed out, that we are witnessing a race between our capacity to keep people out of hospitals and the building of more and more hospital capacity through federal subsidy.

I do not oppose the use of public monies for many aspects of our health and medical program, but I do fear any program that destroys the voluntary hospital or the private educational institution, or that takes away the responsibility of the local communities or the individual citizen for helping to care for their own people.

Such are some of the reflections and observations of the layman and the citizen to the addition of this fine research laboratory to the facilities of the Massachusetts General Hospital. I see it as a heartening example of a great voluntary hospital's being able through diversified support to fulfill its broadest mission and to move ahead into the marshalling of all of its resources of research and practice for the improvement of the health of the community and the nation.

Might there not be inscribed somewhere in this new structure the words of Pasteur:

"Take interest in laboratories. Demand that they be multiplied, that they be adorned. These are the temples of the future—temples of well-being and happiness. There it is that humanity grows greater, stronger, and better."

* * *

From Dr. Jerome Gross (*res. assoc. M*) we secured an explanation of the electron microscope shown on page 6 of this issue. Dr. Gross is in charge of a laboratory, working especially on molecular organization of mesenchymal tissue, in connection with Dr. Bauer's arthritis group. Here, briefly, is what Dr. Gross said:

This instrument is used to study the structure of materials whose units are too small to be resolved by the light microscope. These include biological objects such as viruses, minute structures in cells, large protein molecules, and organized groups of such molecules as are in muscle and tendon. It can also be most effectively used in the study of physical chemical reactions between large molecules, as in the formation of fibers such as collagen.

The electron microscope has a resolving power about 1,000 times greater than the light microscope and magnifications of 300,000 times are feasible, in contrast to a maximum of about 2,000 times for the ordinary microscope. The cost of this machine was about $17,000.

Miss Zelda Kaufman, a technician in the laboratory, is shown placing a specimen in the machine.

* * *

The Massachusetts General Staff Associates Committee is pleased to announce that Mr. E. Michael White joined the Hospital's administrative staff last month.

A graduate of the Harvard Law School, Mr. White will devote his entire time to continuing the study of the organizational problems involved in the formation of a professional group at the Hospital, including the provision of adequate office space and parking facilities. His office is on the first floor of the Baker Memorial, opposite the Admitting Office.

With a long background of experience in working with members of the medical profession and in dealing with problems of medical care, Mr. White will bring to bear on our problem a combination of energy and talent which make him admirably suited to undertake this important task.

The Board of Trustees, at their meetings on April 6 and 20, and May 4, voted:

To accept with regret the resignation of Dr. Benjamin F. Miller from the position of Associate Physician to the Children's Medical Service;

To grant Dr. Barr leave of absence and to appoint Dr. Klein as Acting Chief of the Orthopedic Service during this interval (May 6 – July 1);

To grant leave of absence to Dr. Gordon L. Brownell, to go to Argentina for iodine deficiency study;

To grant Phillips House privileges to Dr. Harrison E. Kennard.

To appoint:

Dr. Raymond D. Adams as Chief of the Neurological Service, effective July 1, succeeding Dr. Charles S. Kubik who is retiring;

Dr. Crawford S. Brown as Assistant Resident in Dermatology for the year beginning July 1;

Dr. Grant E. Colpitts as Resident in Pathology for one year, beginning July 1;

Dr. John G. Gibson as Assistant Resident in Psychiatry for the period July 1 – December 31;

Dr. Morten Grove-Rasmussen as Assistant Director of the Blood Bank;

Dr. Byrl J. Kennedy as Resident in Medicine, to begin on or about July 1;

Dr. Charles S. Kubik as Consultant in Neuropathology for one year, starting on or about July 1;

Dr. Farahe Maloof as Assistant Resident in Medicine for the term beginning October 1;

Dr. Harrison O'Connor as Assistant Resident in Orthopedic Surgery, beginning July 1, 1952;

Dr. Maurice M. Pechet as Assistant Resident in Medicine for the term beginning October 1;

Dr. Walter W. Theus as Dental Intern for the year beginning July 1.

At their meetings during April and on May 2, the General Executive Committee voted to promote:

Dr. Irving P. Ackerman from the position of Intern to that of Assistant Resident in Medicine for the term beginning July 1;

Dr. George Christman from the position of Intern to that of Assistant Resident on the Dental Service, beginning July 1;

Dr. Stuart Ragland, Jr. from the position of Intern to that of Assistant Resident in Medicine for the term beginning October 1.

To appoint:

Dr. John G. Bisgrove as Clinical Fellow in Physical Medicine for the year beginning August 1;

Dr. Leo Brahm as Clinical Fellow in Surgery, assigned to Endoscopy, for the term beginning May 1 and ending July 1;

Dr. Joshua B. Burnett as Clinical and Research Fellow in Medicine for the period July 1 through December 31;

Dr. Harry C. Curtis as Clinical Assistant in Surgery, with recognition as Assistant to Drs. Allen, Welch, and Donaldson in regard to visiting and prescribing for their patients in Baker Memorial and Phillips House. This appointment will become effective on or about May 7, and will continue for a period of six weeks;

Dr. John von Felsinger as Research Fellow in Anesthesia and in Psychiatry for a period of one year, beginning July 1;

Dr. Jerome Gross as Research Associate in Medicine, effective as of January 1;

Dr. Milton E. Helman as Clinical Fellow in Dermatology, to become effective immediately;

Dr. Salomao Kaiser as Graduate Student Assistant in Surgery for a period of one year, beginning March 15;

Dr. Nils Normann as Research and Clinical Fellow in Anesthesia, effective as of April 1;

Dr. Richard E. Spencer as Clinical Fellow in Anesthesia, effective as of August 15;

Dr. Carlos Tejada as Clinical Fellow in Pathology for the period of one year, beginning July 1;

Dr. Wilbur A. Thomas as Research Fellow in Pathology, beginning July 1. His appointment to the Senior Residency for one year, beginning July 1, has been cancelled. He has been granted a traineeship under the auspices of the National Cancer Institute;

Dr. Wesley G. Woll, Jr. as Clinical Fellow in Physical Medicine, beginning July 1, 1952.

* * *

WILLIAM WOODS BECKMAN

In the September 1948 issue of THE NEWS note was taken of the resignation from the staff of Dr. William Woods Beckman (*EM* 1937). On August 1, 1948 he became Assistant Dean at the College of Medicine of New York University.

In this new job he carried on in the same fine manner as he had here, being particularly occupied in helping medical students with their personal problems, and in teaching medicine, especially in its social aspects.

For many years he had struggled with the utmost courage against steadily advancing disease which, until the end, he did not allow to conquer him. His passing is at once a tragedy for those of us who lose him, and a victory, because he set a noble example. The memory of him will remain warm in the hearts of innumerable friends. They will remember the time when Bill Beckman helped them or comforted them.

J. H. M.

[J. Howard Means, M.D.]

* * *

THE TUMOR CLINIC

In 1919 Dr. George Holmes inaugurated a series of consultation conferences to consider cases referred for radiation therapy. With Dr. Guy Lane, weekly meetings were held to plan the treatment of dermatological cases, with special reference to cancer problems. Dr. Greenough soon joined the group, which extended its field to include all cancer cases referred for radiation, and later all cancer cases. In 1925 this service was expanded to a daily full-time clinic under the name of the Tumor Clinic, with Dr. Greenough as administrative head, and joint responsibility for the service was shared by the Surgical and Radiotherapy Departments. In addition to these departments, the staff of the Clinic included representatives from the departments of Medicine and Pathology, and the sections of Oto-Laryngology, Urology, Neurosurgery, and Dermatology, with consultants representing the other special fields.

Dr. Simmons succeeded Dr. Greenough as administrative head of the Clinic, and on the retirement of Dr. Simmons in 1938 the management of the Clinic was assigned to a committee with representatives of the departments of Surgery, Radiology, Medicine, and Pathology, under the chairmanship of Dr. Daland. Dr. Taylor succeeded to the chairmanship of the committee in 1946, with Dr. Nathanson as Executive Secretary.

At first the Clinic provided voluntary consultation service on cancer cases, while the members of the Clinic supervised selected groups of cases under the system of special assignment. Follow-up studies were carried out in certain groups of cases. With the addition of a full-time social worker in 1930, follow-up was extended to include all cases discharged from the hospital. At present it is the objective to see all tumor cases on admission, to recommend appropriate treatment, to provide consultation service on special problems, and to follow up all tumor cases. With the consent of the hospital staff members, many of the groups of private patients are also included in the follow-up studies. In addition, the Clinic, on request, may assume control of treatment of particular cases and groups for special study or investigation. When the Huntington Hospital closed in 1941, the Clinic and records were transferred to the Massachusetts General Hospital. Patients were notified of the transfer, and this large group of active follow-up cases was integrated with the Tumor Clinic through the efforts of Dr. Daland and Dr. Nathanson.

Although the Clinic is part of the Out-Patient Department, close relationship to Radiotherapy is essential. For this reason, the Clinic has always been housed with the X-ray Department, with which it also shares many of the ancillary personnel. Excellent equipment of the examining rooms and a small operating room were made possible in part by a grant from the American Cancer Society, Massachusetts Division, Inc. A laboratory for prosthetic appliances functions in conjunction with the Dental Department and helps greatly in rehabilitation following disfiguring operations.

The Clinic meets every morning and most afternoons. In addition to representatives of general surgery and radiotherapy constantly in attendance, consultants are available in all specialties, and groups of appropriate cases are segregated to special days, in so far as is possible, in accordance with the following schedule:

	A.M.	P.M.
Monday:	Gastrointestinal Lymphoma, etc.	Lymphoma, etc.
Tuesday:	Breast	Breast and hormones
Wednesday:	Urology Neurosurgery Ophthalmology	Thoracic
	12:00 — Conference	
Thursday:	Oto-Laryngology Dental	Gynecology
Friday:	Dermatology Sarcoma	Stomatology Semiprivate Clinic
Saturday:	General Surgery	

A Clinical Fellowship in Cancer granted by the American Cancer Society has been held by a succession of able individuals who organize the clinics and teaching, and carry out a considerable number of surgical procedures under appropriate supervision. A close liaison is maintained with the Huntington and Vincent Laboratories and with the laboratories of the Harvard School of Dental Medicine.

Weekly teaching conferences for presentation of interesting or unusual problems are well attended and provoke stimulating discussions. A month's elective course in Cancer for Harvard Fourth Year Medical Students, organized by Dr. Nathanson as coordinator, is extremely popular, and has had to be repeated four times in the current year. In addition to the formal teaching exercises, the Clinic is frequently visited by graduate observers who attend for varying periods of time.

A special subcommittee of the Tumor Clinic Committee supervises the use of radium in the hospital and restricts its use to properly trained and experienced persons.

Research in the form of clinical studies of results of treatment are constantly in progress in the Clinic. The above-mentioned close relationship with the laboratories permits intensive investigations to be carried out, with the Clinic providing an abundance of material and supervision of the patients during studies. The provision of free beds for special investigations, as described recently by Dr. Aub, greatly increases the scope and usefulness of studies inaugurated and continued in the Clinic.

The increasing incidence and importance of cancer in the community is reflected in the growth and activity of the Tumor Clinic. This was one of the first cancer clinics to be organized as a part of a general hospital and has served as a model for most of the cancer clinics now widely established throughout the country.

Grantley W. Taylor, M.D.,
Head of Tumor Clinic

* * *

MASSACHUSETTS GENERAL HOSPITAL AND CIVIL DEFENSE

Massachusetts General is one of 29 hospitals which this State has chosen to help assemble a list of possible blood donors for Civil Defense.

The job of preparing this material in a form ready for immediate use in the event of an emergency is a colossal one.

A group of volunteers has already given hundreds of hours to the project. To give you some idea of the amount of work entailed, here is the method of assembling the necessary information:

1. From our 50,000 Blood Bank donor cards of the years 1947-1950 which are numerically filed, a card list of donors is being made and alphabetically arranged. On each card must be written the name and address of the donor, his age, blood group, Rh type, date when he was typed, and his MGH donor number.
2. These cards are then checked for accuracy by another person.
3. From these cards a list is to be made for each city and town in Massachusetts where possible blood donors reside and sent to the Medical Director for Civil Defense in each respective city or town.

As you can see, the job is a prodigious one and the work is of such a nature that the highest degree of accuracy is demanded of all who help with the lists.

If you can help as a trained typist or filer, please get in touch with Mrs. Courtney here at the hospital. The telephone extension number in her office is 257. Every hour you can contribute, during the day or in the evening, will be greatly appreciated by the hospital.

FOR SALE

The Archives Department needs a specially constructed box to contain the hundreds of staff photographs recently removed from their frames, carefully wrapped in cellophane, and now arranged chronologically, from the 1820's to the present time, in a makeshift holder. Upon inquiry, we found that the type of box we need would cost much more than our budget could provide, and so we set about to find a way to finance the construction of the box.

We have assembled four complete sets of The News, to date, which we are offering for sale. At the rate of ten cents ($.10) a copy, the price is ten dollars ($10) for the hundred issues. The first number, published in October 1942, contains a picture of the members of the 6th General Hospital, assembled on the Bulfinch steps just before they left for Camp Blanding. This issue was exhausted immediately after its appearance and from that time since has literally been a collector's item. The letters which appeared in The News from our men and women in the armed services during World War II will never be forgotten by those who read them; and the accounts of activities in our various departments since the war furnish valuable source material in all fields of medical and surgical work. Items of a more personal nature have their value, too, for every MGH-er.

So—who will buy our Newses? First come, first served.

MASSACHUSETTS EYE & EAR INFIRMARY

The Infirmary notes with regret the death on May 3 of Dr. Frederick L. Jack, former Aural Surgeon in Chief of this hospital.

Dr. Jack was graduated from Harvard Medical School in 1884 and joined the staff of the Infirmary the same year. At the time of his death, Dr. Jack was a Consulting Surgeon in Oto-Laryngology. He left a very generous bequest to the Infirmary and an additional grant to the Mosher Laboratory.

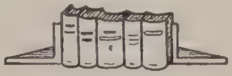
Dr. LeRoy A. Schall, Chief of Oto-Laryngology, presented a paper as part of a symposium at the meeting of the American Otological, Rhinological and Laryngological Society at Atlantic City on May 6. "Cancer of the larynx—Five-year results" was Dr. Schall's topic.

Dr. Carl C. Johnson took part recently in the postgraduate course in Ophthalmology and Oto-Laryngology at the University of Kansas. Dr. Johnson spoke on "Ptosis" and "Surgical treatment of glaucoma".

At the American Medical Association meeting at Atlantic City in June, Dr. Charles L. Schepens, Director of the Retina Service, will read a paper on "Subclinical retinal detachments". Dr. David D. Donaldson will have an exhibit of stereophotographs of human brain dissections, showing neuro-ophthalmological relationships.

Mrs. Eunice W. Wilson, who has been Director of our Social Service Department since October 1940, has submitted her resignation, effective as of June 1951. Since resigning from the Infirmary, Mrs. Wilson has been offered a position as Medical Social Consultant at the United Community Services and will assume this new position in the fall.

The Executive Committee has announced the appointment of Dr. Taylor Smith as Assistant in Ophthalmology.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would remember to include that information.

In answer to a common question which has arisen, your title should be classified with respect to the subject matter and not under the hospital department with which the author is affiliated. As an illustration —an article written by a member of the Psychiatry Department may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The deadline date for each issue of The News is the 12th of the preceding month.

All requests for reprints are to go directly to the individual authors, and *not* to Treadwell Library nor to The News.

The following new titles have been received:

Dentistry

Rounds, C. E., and Goldman, H. M.
Adenoid cystic basal cell carcinoma (adenocarcinoma): Report of a case.
Oral Surg., Oral Med., & Oral Path. 4:303-308.

General Medicine

Palmer, R. S.
"Improvement" in the hypertensive pattern of the electrocardiogram.
Ann. Int. Med. 34:712-716.

Neurology, Neurosurgery, and Psychiatry

Benda, C. E., Farrell, M. J., and Chipman, C. E.
The inadequacy of present-day concepts of mental deficiency and mental illness in child psychiatry.
Am. J. Psychiat. 107:721-729.

Cobb, S., and Miles, H. H. W. (Editors)
Convalescence in a patient with permanent neurologic disability.
Am. J. Med. 10:386-392.

Miles, H. H. W., Barrabee, E. L., and Finesinger, J. E.
Evaluation of Psychotherapy.
Psychosom. Med. 13:83-105.

Money, J.
Observations concerning the clinical method of research, ego theory, and psychopathology.
Psychiatry 14:55-66.

Shands, H. C., Miles, H. H. W., and Cobb, S. (Editors)
The emotional significance of cancer: Psychiatric conference.
Am. Pract. & Digest Treat. 2:261-265.

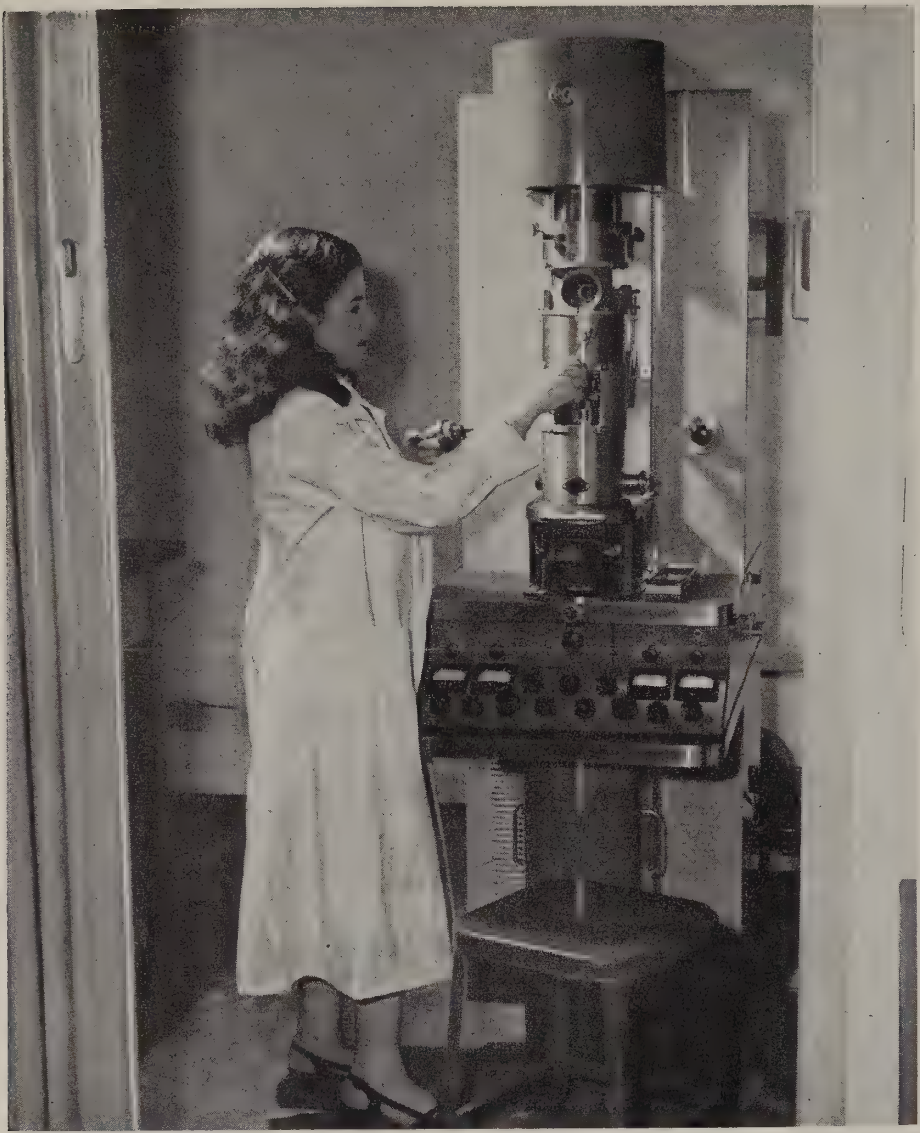
Waldfogel, S., and Guy, W.
Wechsler Bellevue subtest scatter in the affective disorders.
J. Clin. Psychol. 7:135-139.

Orthopedic Surgery

Pike, M. M.
Legg-Perthes disease: A method of conservative treatment.
J. Bone & Joint Surg. 32-A:663-670.

Pediatrics

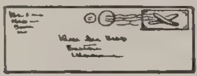
Gardner, L. I., and Reyersbach, G. C.
Brain damage in a juvenile diabetic patient associated with insulin hypoglycemia.
Pediat. 7:210-214.



The electron microscope

One of the many new pieces of equipment in the Research Building. This instrument is described briefly on another page.

Locke, W., Talbot, N. B., Jones, H. S., and Worcester, J.
Studies on the combined use of measurements of sweat electrolyte composition and rate of sweating as an index of adrenal cortical activity.
J. Clin. Investigation 30:325-337.



We were indeed glad to receive this note from Ruth Steglich, past Chief of Occupational Therapy here at Massachusetts General. Her address is Woodrow Wilson Rehabilitation Center, Fishersville, Virginia. The note reads:

> Much as I miss everyone at M.G.H., I do find my new work fascinating and a real challenge, for we are, in a sense, pioneering. This does seem to be the answer to the over-all rehabilitation problem.
>
> Best wishes to everybody I know up there.

A recent communication from Dr. Terry E. Lilly, Jr. (*ES* 1943) says, in part:

> I am now in that category familiarly referred to as "established in practice" with my father here at 807 Argyle Building, Kansas City, Missouri. Barring the usual disasters, I may be reached here from now on.

New addresses:—

Lt. Col. Frank L. Bauer, MC, USAR (*P* 1941), Army Medical Service Graduate School, Army Medical Center, Washington 12, D.C.
Dr. Joseph H. Boyes (*P* 1930), 416 North Alabama, San Gabriel, Calif.
Dr. George A. Filmer (*Oph.* 1939), 610 Metropolitan Bldg., Denver 2, Colo.
Dr. Donald M. Glover (*WS* 1922), 10300 Carnegie Ave., Cleveland 6, Ohio.
Dr. Buford Hall (*M* 1946), 336 East Main St., Georgetown, Ky.
Dr. Irad B. Hardy (*ES* 1939), 94 Russell St., Waltham 54, Mass.
Dr. Ralph Hawkins (*NS* 1948), 571 Hamilton Ave., Palo Alto, Calif.
Dr. Glenn W. Lawrence (*dn. s.*), 25 Bay State Road, Boston, Mass.
Dr. Pauline Owyang (*CM* 1943), 1624 Franklin St., Oakland 12, Calif.
Dr. Walter W. Point (*clin. & res. fel. M*), 330 Dartmouth St., Boston, Mass.
Dr. Hubert A. Shaffer (*a.r.p. R* 1932), 244 Lebanon Ave., Hopecrest, Morgantown, W. Va.
Dr. Earl G. Solomon (*r.p. Psychiat.* 1950), Department of Psychiatry, Cincinnati General Hospital, Cincinnati 29, Ohio.
Dr. Joseph K. Surls (*Or.* 1920 & *ES* 1922), 130 East End Ave., New York 28, N. Y.
Dr. Robert J. Tracy (*ES* 1943), 18 Bank Row, Pittsfield, Mass.

Brief bits:—

Dr. Henry K. Beecher, Chief of our Anesthesia Service, has recently returned from the University of Louisville where he was Visiting Professor under the Commonwealth Foundation. During his visit he gave eight lectures.

Dr. J. Howard Means, Chief of Medical Services at M.G.H., delivered two lectures at Johns Hopkins Hospital on April 26 and 27, under the William Sydney Thayer and Susan Read Thayer Lectureship in Clinical Medicine. Dr. Means's subjects were "The thyroid hormone: Certain aspects of its elaboration in the body and of its action on end organs" and "The use of hormones, drugs and radiations in the management of thyroid disorders".

Dr. Clarence A. Traver (*WS* 1927) is still at 28 Willett St., Albany 6, N.Y., and *not* at Bath, N.Y., where his brother is practising surgery.

* * *

It is a pity that so few staff members realize how nicely their convalescent patients can be accommodated at Storrow House. This is an ideal spot for anyone who isn't quite up to going home but is nearly enough well to make the use of a hospital room for the rest of the time a questionable expenditure.

Storrow House offers nursing service for dressings and treatments, and medical supervision. For specific information in relation to its suitability for your patient, see Dr. John Homans, Jr. or Dr. C. L. Clay, or call Miss Welch at Storrow House (LIncoln 6-0343).

* * *

The hospital is soon to be favored by a very special art show. Water colors and prints by Boris Margo, well-known New York artist, will be on exhibition in the Brick Corridor for two weeks, beginning June 14.

At the instigation of your editor and one or two of Margo's pupils who live in this vicinity, he was persuaded to conduct a creative art seminar in Boston for a few weeks last fall. Several MGH-ers were members of the group. When he departed for Orlando and Louisville to give similar courses last winter, he left a sizable collection of his paintings in the custody of your editor for safe keeping. As the time approached for him to take the paintings to Provincetown, where he spends his summers, it seemed a pity that more people could not enjoy these paintings while they are still here, so we secured Margo's permission for the exhibition.

Examples of Margo's work are in the permanent collections of the Museum of Modern Art, the Metropolitan, the Whitney, the Chicago Art Institute, the Philadelphia and Brooklyn Museums, the Rosenwald Collection, the United States National Museum, New York Public Library, the Smithsonian Institution, and many art collections of universities, colleges, and private individuals. Locally, other Margos may be seen at Margaret Brown's Gallery on Dartmouth Street.

The paintings will be changed every few days so that as many of the pieces as possible may be shown.

THE NEWS

No. 103 Boston, Mass. July and August 1951

DR. JAMES HOWARD MEANS,

CHIEF OF THE MEDICAL SERVICES OF THE MASSACHUSETTS GENERAL HOSPITAL

1923 – 1951

In order adequately to present the important contribution made by Dr. Means to the Massachusetts General Hospital, a brief historical introduction is essential. This hospital has happily been blessed, since its beginning in the early years of the last century, with many of the community's ablest and most devoted administrators, physicians, surgeons, nurses, and other specialists and personnel too numerous even to classify. It is indeed a community in itself with a personality all its own.

In the first century of its existence the hospital needed or at any rate was able to secure, with rare exceptions, only part of the time, activity, and thought, and then often very brief and fleeting, of those on its staff. As it grew and as medical knowledge increased it became essential to add to the staff full-time workers who were willing to sacrifice careers in private practice in order to devote all their thought and energy to some phase of the hospital service, be it administrative, clinical, research, or teaching. This development has come into full blossom today, a generation after the seeds were sown by such leaders as David Edsall, Richard Cabot, and Frederic Washburn. Full-time chiefs of the medical and surgical and certain special services, such as those of pediatrics, roentgenology, and pathology, a full-time staff of social service workers, and full-time researchers have established themselves as vital cogs in the machinery of the hospital community.* And as a result, the value of the hospital has been enormously enhanced, since happily at the same time the large staff of part-time workers has also grown in numbers and usefulness, bridging the gap that might otherwise separate the hospital itself from the citizenry and community for which it exists.

One of the very first of these full-time workers on the medical staff, who is now completing a long, useful, and devoted career in such service on June 30, 1951, is Dr. James Howard Means who followed Dr. Edsall as the second single Chief of the Medical Service in 1923. Prior to Dr. Edsall's own appointment in 1921 as the first single chief, there had been two chiefs, one for each of the two medical services, East and West, including such teachers of the older members of the staff as Drs. Shattuck, Cabot, and Lee.

Dr. Means was born in Dorchester, June 24, 1885 and after graduating from Noble and Greenough's School and Harvard College entered the Harvard Medical School in 1907 where he finished four years later the top man in his class with a grade of 90.49 percent. Then followed an East Medical internship, work with Dr. Benedict at the Carnegie Nutrition Laboratory, and study abroad in Copenhagen under August Krogh. In 1912 Dr. Edsall had arrived to take over the task of developing medical research at the hospital. This involved the setting up of laboratories and the establishment of new posts such as a Medical Resident, the first of whom was Dr. Walter W. Palmer, later Bard Professor of Clinical Medicine at Columbia University. In 1913 Dr. Means was appointed Walcott Fellow and in the spring of 1914 he set up the Basal Metabolism Laboratory under the Out-Patient Amphitheatre. There he began his notable life-long studies of the thyroid gland and its diseases. During World War I he served abroad, first as medical officer with Base Hospital No. 6 and then as adjutant there and later as administrative officer in England.

On this background of training and with an innate administrative interest and ability it was natural that Dr. Means should be appointed chief of the medical services and Jackson Professor of Clinical Medicine when in 1923 Dr. Edsall relinquished his post at the hospital to become full-time dean at the Harvard Medical School.

With extraordinary patience, wisdom, and skill Dr. Means has through the years directed the medical service, maintaining a fine balance between the broad field of internal medicine and the specialties in practice, research, and teaching. Thus the workers in endocrinology, gastroenterology, cardiology, and other branches of internal medicine have all had their share in the general visiting service in wards and out-patient department and have gathered weekly to attend the instructive Medical Grand Rounds. This successful division of labor and of opportunity brought renown to the old hospital, attracted many students and visitors from far and near, and set an example which was followed by many sister institutions.

Dr. Means, himself an able and eager worker in clinical research, constantly stimulated his colleagues to study not only problems that arose in the daily care of the sick but also basic principles, frequently in collaboration with scientists in the fields of physiology, pharmacology, chemistry, physics, and engineering at Harvard and at the Massachusetts Institute of Technology. Many volumes of medical papers and longer monographs have been published by members of the medical staff during the term of service of Dr. Means, and among them can be listed articles of historic importance presenting new discoveries related to etiology, diagnosis, and treatment. It was Dr. Means who fostered for many years, almost single-handed, the metabolic research ward, Ward 4, where critical clinical tests revealed the answers to many medical problems of the day. And now there has been added to the hospital the new Medical Research Building, the culmination of long years of hopeful planning by Dr. Means and his associates.

In closing this brief historical summary of the vital contribution that Dr. Means has made to the Massachusetts General Hospital may I express both for his older colleagues who include me and also for the younger members of the Medical Staff, and indeed for the entire hospital community, our gratitude and affection for what he has meant to us through the years, and the wish that he may have many more happy and useful days ahead.

Paul D. White, M.D.

* * *

THE NURSING DEPARTMENT

A PROGRESS REPORT TO THE STAFF

Where are all the graduate nurses? What has happened to our supply? What is the Nursing Department doing about this shortage?

When so much is being said about the need for nurses, it may be a surprise to many members of the MGH family to learn that the Hospital employs almost as many graduate nurses today as at any other previous time, except in the spring of 1950. These nurses will not be found on all the wards, but they can be found in the Blood Bank, the Intravenous Service, the Central Supply Room, the Operating Rooms, on the Research Ward, the Psychiatric Ward, the Isolation Floor, Bulfinch 3, on four floors at Baker where students are not assigned, and teaching in the School of Nursing. Six graduate nurses will be found covering the assignments which five carried before the hours were reduced from fifty-two to forty-four a week. There will be three night nurses assigned to night and evening positions that were filled by two before patient service was accelerated by early ambulation and discharge. But the graduates are here. The situation at M.G.H. follows the national pattern. The problem is one of demand and distribution rather than shortage.

---

* The oldest in point of service of all the hospital full-time workers are, of course, the nurses and the housekeeping staff who necessarily had to function from the very beginning.

The answer to the Hospital's need for nurses has been sought in two ways: through changes in the School program, and through modifications in the plans for Nursing Service. A new program for the School of Nursing was introduced in the fall of 1948. Graduation Exercises for the 104 members of the first class in this experimental program were held on June 15. The primary aim in the experiment was to determine whether or not a bedside nurse could be prepared in less than three years' time. Because the State law in Massachusetts, and in most other States, requires a minimum of three years for all registered nurses graduating from a hospital school, the program was divided into two units: an educational period of twenty-eight months, during which the student meets all State requirements in terms of class content and clinical practice; and an internship of eight months, during which the student has opportunity to develop skill in patient care, and to become oriented to the responsibilities of graduate nursing service. In acknowledgment of the large amount of service given to the Hospital by the nurse intern, she receives a stipend of $30 per month. Thus, in her last year she may have a small measure of financial independence.

Since this new program began, the enrollment of the School has increased from 241 to 387—a gain of 60%. Recruitment has been carried on actively in spite of the growing number of applicants. Applications for fall classes now outnumber possible admissions five to one. In the spring the ratio is usually three to one. As against the rate of over 30% annual drop-outs from schools of nursing in the country as a whole, our loss for 1950 was 6.5%.

Such an increase in the number of students, combined with the acceleration of the teaching schedule, has aggravated the need for more housing, teaching, and recreational facilities. Ninety applicants have been accepted for September 1951—the maximum number which can possibly be accommodated in our classrooms. As registration of the incoming class precedes graduation of the September 1951 class, it is impossible to find rooms enough for the entire School. As in 1950, we shall again give housing allowances to seniors who will move out into nearby apartments in August.

The Coordinated Program conducted by Radcliffe College and the School of Nursing is growing slowly. In the fall of 1950 the Simmons College School of Nursing affiliated with the Coordinated Program. The total collegiate group at the School of Nursing during the summer of 1951 will be 76 students, 36 of whom will live at Simmons College. Twenty-seven will remain at M.G.H., after the summer session is over, for their two years of clinical experience.

Space for student activities is also a problem. The art classes use the classrooms. The Glee Club and the lecture groups gather in the Walcott or Thayer living rooms. The basketball team, for lack of a gymnasium at home, goes to the Peabody Settlement House. The student newspaper staff has a corner in the Walcott House boiler room. The Senior Class despairs at the cost of the Peabody Playhouse when their annual play is staged. The Student Organization meets in the Moseley Rotunda, for no other room is large enough to accommodate the membership, in spite of the fact that many will be absent and on the wards for evening assignment. Only the bimonthly Friday night informal dances seem always to find an appropriate space in the Walcott House living room.

For housing facilities there is hope. Funds are available to begin the first unit of a nurses' residence in the fall. Whether enough money can be secured to include classrooms and adequate space for recreation in the second unit to be built is still a question of great concern.

One answer already made to the shortage of nurses is a larger number of graduates from the School with a patient-centered curriculum designed to prepare young women for the practice of nursing in the shortest period of time consistent with good nursing education.

A second answer to our problem is being sought through a variety of plans. Advertising brought no employable nurses. Constructive publicity did have a very definite effect on the numbers of nurses, licensed attendants, and aides who applied. But the supply of nurses which more than compensated for resignations between January and March disappeared entirely in May.

In 1941 a typical Baker floor staff for twenty-four hours was comprised of 17 graduate nurses (including 2 head nurses), 2 second or third year student nurses, 1 secretary, 2 ward helpers, and 2 or more orderlies. In contrast today, with the shortened hours, there may be 6 graduate nurses (including 2 head nurses), 1 nurse intern, 2 second year students, 6 students who have been in the School for 8 months, 1 secretary, and 8 aides (including 3 nursing orderlies). Or, there may be a total of 10 graduate nurses, 1 secretary, 3 licensed attendants, 3 student attendants, 7 aides (including 3 nursing orderlies), and 3 ward helpers. The General Hospital wards have shown similar changes.

Hospital aides were introduced in the General Hospital five years ago—young men and women trained briefly, as a group in the classroom, in simple nursing techniques and then supervised in their practice on the wards. This training program has continued constantly, until today aides are employed in all divisions of the Hospital and for many different types of work. In addition to assisting with patient care, aides have replaced staff nurses in the Central Supply Room. They have relieved a small percentage of the nurses on evening and night assignments. They are responsible for the care and sterilization of equipment in utility and treatment rooms, and "suction" rooms. In the General Hospital a small corps of men aides have been taught to scrub, to relieve or supplement nurses in the Operating Room as the need may arise.

Before 1941 the trained attendant was found to be a valuable member of the Baker nursing personnel. But trained attendants either felt insecure on the active Baker floors or the MGH personnel policies did not meet their needs, for the number remained small. In November 1950 the team plan for nursing care was introduced at the Baker. In April 1951 an affiliation was begun with the Household Nursing Association, in which the student attendants are sent to the Baker Memorial for 13 months of training in bedside nursing. Since the first of the year the number of graduate licensed attendants has risen from 7 to 27. This group, with a definite occupational interest and training, promises to be more stable than untrained personnel whose interests are easily diverted to industry.

The head nurse is the nursing key to good patient care. But her assignment has been so changed by trends of the past few years that she often finds her day too short for time to spend with patients or to supervise personnel in the giving of patient care. Assignment of personnel must be carefully planned when all members of the group cannot carry the same functions. More hours must be spent at the desk when the ward becomes a functional unit of the Hospital's accounting system. More doctors expect the head nurse to carry increasing responsibility for medical orders. It would be interesting to have prewar figures for contrast to see how medical changes have affected the head nurse's activities today. On the large Baker floors it is not uncommon to have as many as 77 doctors, by actual count, come to a floor between 7 A.M. and 7 P.M. to see patients. It is also not uncommon to have each of 2 members of a visiting surgical team rewrite a patient's orders within that same 12-hour period. When such a floor is fully occupied there may be as many as 6 to 7 discharges, an equal number of admissions, 3 to 4 operations, 3 to 4 patients prepared for operation, and 7 to 8 patients sent to X-ray—all within a 12-hour period.

Last fall assistance was secured from the United States Public Health Service for a study of head nurse functions. Four General Hospital and two Baker floors were studied. A report on this study will be published shortly. It shows a disproportionate amount of time spent on clerical activities, too little time available to know patients or plan the administration of the ward, and a shocking number of unnecessary interruptions. All of us had known most of these facts before the survey was made, but the head nurses who were studied and others who shared in the tabulations have been stimulated to seek ways whereby the head nurse can be freed to do the work which only she can do.

The first change to be put into effect was the introduction of the team plan. In the team plan a staff nurse or a nurse intern acts as leader for a group. The group may include a licensed attendant, a student attendant, or a nursing orderly. Under the guidance of the nurse the team cares for a group of patients, each member of the team carrying out the functions for which he or she is prepared. The team leader plans with the head nurse, interprets to the team members the plan for care, and works with them or supervises as the need may be. She cares for the more critically ill or the emotionally disturbed patients in the group, gives the medicines, does the treatments which cannot be done by auxiliaries, and teaches the patients whatever is appropriate.

This plan relieves the head nurse and enables her to give more oversight to the ward activities in general and to patient care in particular. The plan stimulates the staff nurse and makes her work more interesting because she, too, has opportunity to know her patients better. It offers more security to the auxiliary workers, some of whom have chosen to work at M.G.H. because the team plan was in use. Most important of all, the patients have expressed appreciation for the continuity of care and the interest shown in their individual welfare which the team provides.

But the answer to the shortage of nurses is not to be found merely in the number of workers or their assignments. A full-time supervisor is now assigned to investigate needs for new equipment, methods of improving the care and use of equipment, and means for reasonable standardization in all divisions of the Hospital, all of which can bring significant economies and facilitate patient care. Our next need is for a worker who can study our methods of nursing care and explore ways in which they, too, can be simplified and improved, to the end that there will be more time for patient care.

Better care of the patient and enough of it to keep all desired beds open is the only justification for seeking more graduate nurses. A well-organized plan for nursing care, time and the facilities with which to give good patient care, a reasonable hour schedule, a stimulating in-service education program, and active interest in the nurse and her problems are the major factors which hold graduate nurses. From these factors Nursing at M.G.H. has drawn its objectives for 1951.

Ruth Sleeper, R.N.,
Director of the School of Nursing and Nursing Service

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. LeRoy A. Schall, Chief of Oto-Laryngology, was elected President of the American Board of Oto-Laryngology at the Board's May meeting in Richmond, Virginia. Dr. Schall had been serving as the Board's Vice President.

Dr. Parker Heath, Director of the Pathology Laboratory, read a paper on "Iris tumors" at a meeting of the American Ophthalmological Society, held the week of June 5 at White Sulphur Springs, West Virginia.

Dr. John J. Shea, former Resident in Oto-Laryngology, now serving with the armed forces, is stationed at a United States Naval Hospital in Bainbridge, Maryland. Dr. Shea writes:

> The hospital is being rebuilt to hold about 1,000 and there are 80 beds assigned to EENT, about half of which will be ENT. I am the Chief of Service, with a full captain over me in charge of the eye department and the EENT section as a whole. There are two operating rooms for ENT, about the size of the smaller ones at the Eye and Ear. The equipment is not only the best, but is all that my mind can think up. Every effort is being made to make it a complete department in every way.

On June 6 Miss Florence Morrissey, R.N., former Chief Anesthetist at the Infirmary, was honored by Drs. Mosher, Schall, and Meltzer for her years of outstanding service.

Miss Morrissey came to the Eye and Ear in August of 1919, and when she retired in May had completed 32 years of work at this hospital. Presenting Miss Morrissey with a watch and a check, Dr. Mosher said:

> I have been asked by the Staff of the Infirmary to present you with this check and this watch, in appreciation for a job well done, over (if you will permit me to say it) many years. It is a great pleasure to me, and I feel it a high compliment to be asked to do this.
>
> I remember that you etherized me once, and I went under knowing that a friendly hand and a fully competent one held the ether cone. That was before the machine age in anesthesia. I was told afterwards, but not by you, that I was a bad patient, like most doctors.
>
> The check, I hope, will help a bit with the high cost of living. As the watch tells you present-day time, now and then turn to the memories of olden days. They should give you much pleasure and satisfaction. All of us owe you many a smooth operation. Tact, skill, and the human and sympathetic touch were yours in abundance.

The Retina Foundation, which is affiliated with the Infirmary, opened its doors on May 19 at 30 Chambers Street, Boston. The Foundation will conduct studies into the causes and more effective treatment of retinal separation, in close conjunction with the Infirmary's Retina Service.

The General Executive Committee, at their meetings on May 9 and 23, and June 6, voted:

To accept the resignation of Dr. Frederic C. Bartter as Clinical and Research Associate in Medicine, in order that he may take up his new assignment with the United States Public Health Service;

To grant Dr. N. Joel Ehrenkranz leave of absence for the month of June. He reported for active duty with the Army on June 1;

To promote Dr. Lyman C. Wynne to the position of Resident in Psychiatry, beginning July 1.

To appoint:

Dr. Jacques Arlet as Clinical and Research Fellow in Medicine, to begin July 1;

Dr. John A. Benson, Jr. as Clinical and Research Fellow in Medicine for one year, beginning July 1;

Dr. William R. Brewster, Jr. as Clinical and Research Fellow in Anesthesia for one year, beginning July 1;

Dr. William C. Ebeling as Clinical and Research Fellow in Medicine for one year, beginning July 1;

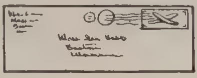
Dr. Margaret S. French as Clinical Fellow in Psychiatry for the term beginning July 1;

Dr. Paul Maurice as Research Fellow in the Children's Medical Department for the period June 1 to September 1;

Dr. Leon W. Miller as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Jean-Claude Roucayrol as Research Fellow in Surgery for the period May 14 through June 15;

Dr. Marvin M. Wasserman as Clinical Assistant in Medicine for the period May 15 to December 31, to work in the Out-Patient Department.



New address:—

Dr. Enrique L. Matta, Jr. (*gr. stud. a.* 1951), Department of Pediatrics, Jackson Memorial Hospital, Miami, Fla.

Brief bits:—

Dr. Edward B. Benedict, Endoscopist at M.G.H., discussed the following papers at the annual meeting of the American Gastroenterological Association, held in Atlantic City on June 8 and 9: "Experience with the operating gastroscope", by Drs. Wirts, Carroll, and Breckenridge; "Differentiation between benign and malignant disease of the gastric antrum", by Drs. Flood and Hennig; "The clinician and gastroscopy", by Drs. Alessandri and Lerner.

Renewal to his subscription gives the rank of Lieutenant Colonel for Frank A. Mantz, Jr. (*res. fel. P* 1950).

Dr. Joe V. Meigs, Chief of Gynecology on our staff, and Mrs. Meigs flew to Europe on June 9 and arrived in Geneva the following day. Dr. Meigs attended the meeting of the Congrès International Jubilaire de la Société Francaise de Gynécologie in Paris from June 22 through June 30. He presented a paper on the early diagnosis and treatment of cancer of the cervix at the meeting on June 26. While in Europe Dr. and Mrs. Meigs met Dr. John McL. Morris (*ES* 1941) and his bride. Dr. Morris was granted a fellowship for a year through the American Cancer Society and is at the Radiumhemmet at Stockholm at the present time. The Meigses will also visit Belgium, Germany, and Holland. They will fly home from Paris on August 9.

Mr. Raymond J. Reynolds has been appointed Administrative Resident at the hospital.

Dr. Paul S. Russell, Jr. (*S* 1949) was called to active duty in the U. S. Air Force on June 1.

Dr. Robb H. Rutledge (*S* 1950) signed out on June 4 to begin duty with the U.S. Air Force.

Dr. Robert S. Schwab, Associate Neurologist at M.G.H., was guest speaker at the meeting of the North Pacific Society of Neurology and Psychiatry, held in Victoria, British Columbia, on April 20 and 21. His subject was "Electroencephalography in clinical practice".

Dr. Arthur L. Watkins, Chief of Physical Medicine on our staff, addressed the New York State Medical Society in Buffalo on May 2. The subject of his paper was "Physical Medicine for the neurologic patient".

* * *

Dr. Viets called our attention to the following notice which appeared in the May 5 issue of the *Journal of the American Medical Association.* It concerns Dr. Harold W. Smith (*SS* 1903), and reads:

> The Naval Medical School, Bethesda, Md., has created an annual lectureship to be called the Harold Wellington Smith Lecture in honor of Rear Admiral Harold W. Smith, U.S.N., retired, former commanding officer of the Naval Medical School and the Naval Medical Center. Admiral Smith entered the Navy in 1904 after three years of residency in Massachusetts General Hospital. He served with distinction in many important positions until his retirement from active duty in 1946. He received the Legion of Merit for his achievements in medical research. Admiral Smith is now living at the Westchester Apartments in Washington.
>
> The physician selected to give the first lecture in this annual series, on April 27, was Dr. Hans Selye, director of the Institute of Experimental Medicine and Surgery, University of Montreal, Montreal, Canada. The surgeon general of the Navy, Rear Admiral Lamont Pugh, spoke on Admiral Smith's contributions to medicine.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted, though less frequently than heretofore. It would save your editor considerable time and trouble if you would remember to include that information.

In answer to a common question which has arisen, your title should be classified with respect to the subject matter and not under the hospital department with which the author is affiliated. As an illustration—an article written by a member of the Psychiatry Department may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The deadline date for each issue of THE NEWS is the 12th of the preceding month.

All requests for reprints are to go directly to the individual authors, and *not* to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Anesthesia

Bunker, J. P., Beecher, H. K., Briggs, B. D., Brewster, W. R., and Barnes, B. A.
Metabolic effects of anesthesia. II. A comparison of acid-base equilibrium in man and in dogs during ether and during cyclopropane anesthesia.
J. Pharmacol. & Exper. Therap. 102:62-70.

Cohen, E. N., and Beecher, H. K.
Needless use of a narcotic in preanesthetic medication. (Abstract)
Federation Proc. 10, Part 1:288.

Goodnow, R. E., Beecher, H. K., Brazier, M. A. B., Mosteller, F., and Tagiuri, R.
Physiological performance following a hypnotic dose of a barbiturate.
J. Pharmacol. & Exper. Therap. 102:55-61.
Same (Abstract)
Federation Proc. 10, Part 1:299.

Keats, A. S., and Beecher, H. K.
Respiratory effects of some new analgesics. (Abstract)
Federation Proc. 10, Part 1:313.

General Medicine

Hardy, H. L., Bishop, R. C., and Maloof, C. C.
Treatment of lead poisoning with sodium citrate.
A.M.A. Arch. Indust. Hyg. & Occup. Med. 3:267-278.

General Surgery

Churchill, E. D.
Fifty years of medical progress: Medicine as a science: Surgery.
New England J. Med. 244:799-805.

Cope, O.
La chirurgie va-t-elle abandonner a la medecine le traitement de l'hyperthyroidie.
Semaine d. hôp. Paris 21:887-892.

Laboratory Science

Waksman, B. H.
Significance of complement in tuberculin cytolysis. (Abstract)
Federation Proc. 10, Part 1:423.

Waksman, B. H., and Morrison, L. R.
Tuberculin type sensitivity to spinal cord antigen in rabbits with isoallergic encephalomyelitis.
J. Immunol. 66:421-444.

Ophthalmology

Beetham, W. P.
Diabetic retinopathy in pregnancy.
In Tr. Am. Ophth. Soc., vol. XLVIII, New York, Columbia University Press, pp. 205-219.

Cogan, D. G.
Applied anatomy and physiology of the cornea.
Tr. Am. Acad. Ophth., Mar.-Apr.:329-359.

Cogan, D. G., and Donaldson, D. D.
Experimental radiation cataracts. 1. Cataracts in the rabbit following single X-ray exposure.
A.M.A. Arch. Ophth. 45:508-522.

Dunphy, E. B.
Classification of diseases of the cornea.
Tr. Am. Acad. Ophth., Mar.-Apr.:382-386.

Oto-Laryngology

Mangiaracine, A. B.
Modern bacteriology as an aid to the Oto-laryngologist.
Ann. Otol., Rhin. & Laryng. 60:230-234.

Mangiaracine, A. B.
Oral moniliasis following antibiotic therapy: A warning.
New England J. Med. 244:655.

Pediatrics

Zygmuntowicz, A. S., Wood, M., Christo, E., and Talbot, N. B.
Studies of urinary 17-ketosteroid excretion by means of a new micro-chromatographic fractionation procedure.
J. Clin. Endocrinol. 11:578-596.

War Medicine and Surgery

Churchill, E. D.
Selective evacuation vs. hitchhiking.
J.A.M.A. 145:841.

Books

Benedict, E. B.
Endoscopy, as related to diseases of the bronchus, esophagus, stomach, and peritoneal cavity.
Baltimore, Williams & Wilkins Co.

Schwab, R. S.
Electroencephalography in clinical practice.
Philadelphia, W. B. Saunders Co.

* * *

In our June issue we included as many of the addresses given at the Research Building dedication exercises as space permitted. We continue here with those speeches.

The following address was delivered by Dr. W. Palmer Dearing, Deputy Surgeon General, United States Public Health Service:

> There are few more heart-warming experiences than to share a moment of triumph with the institution that helped shape one's career. Coming to Massachusetts General Hospital today, I feel that real personal gratification. And this is not only because the occasion sets a new landmark in the forward march of science and public health, but especially because it gives me a chance to be with the people who know me best—among them the hospital's distinguished director, Doctor Dean Clark.
>
> This new institution, dedicated to the science of healing, will be a landmark for future surveyors who seek to chart the course of medical science or medical practice, of public health or social action. For the Research Building itself is a symbol: A symbol of Massachusetts General Hospital and its long history, its high traditions, and higher aspirations; a symbol of man's "divine discontent" which drives medical science onward; a symbol of democracy wherein all the people work together for a common good.
>
> The significance of the Research Building to the growth of Massachusetts General Hospital and to medical science is apparent to all of us. I would like to focus our attention, therefore, upon a more spiritual significance, a significance we too often take for granted: namely, this institution as a symbol of democracy. Democracy stands challenged today by vast forces which threaten not only our ideals and institutions, but our very lives. Only in the successful meeting of that challenge can our country preserve a free science, a free society, or even the bricks and mortar of this building!
>
> Massachusetts, along with three other States of the Union—Virginia, Pennsylvania, and Kentucky—proudly bears the title "Commonwealth". That title, too, is a symbol of this Nation's earliest commitment to the ideals of democracy, for "the Commonwealth" was Oliver Cromwell's choice to replace "kingdom" when he came to power in England—at a time when the Massachusetts Bay Colony was less than 30 years old. "The Commonwealth" expresses admirably the sum total of the people, the resources, the social and political institutions that make up a State. "The Commonwealth" also suggests explicitly the sharing of responsibilities and privileges which we consider basic to citizenship in a democracy.
>
> The whole life story of Massachusetts General proclaims it to be an institution of the

commonwealth. The local commonwealth of Boston and nearby communities began it. They and the commonwealth of Massachusetts built it, nourished it, and shared in its problems and triumphs. But there has also been a larger commonwealth of citizens in other States and communities who helped to build and support, and who benefit from this institution.

Because of this ever-widening participation, Massachusetts General Hospital is truly a national and international institution. And this is so not simply because the Federal Government has contributed to the hospital's most recent development. It is so because the sick and broken have come here from far and wide to be restored. It is so because this hospital is *Alma Mater* to thousands of sons and daughters who carry to all corners of the world the skills, the ideals they acquired here. It is so because great revolutionary discoveries and developments have emanated from here, lighting the way to swifter, surer alleviation of suffering and to better health for all people everywhere. Today the area of commonwealths served in some way by this institution encompasses the whole of our country, and indeed the greater part of the world..

The outreach of a social institution is commensurate with the diversity of its support and the spread of its services. Without a wide diversity of support and participation, the conception, gestation, and delivery of the hospitals's newest baby—the Research Building—could not have taken place.

It is true that the building and the distinguished work that goes on in it "belong" in an immediate sense to the people of Massachusetts who have contributed to the hospital's research program. But the housewife in a small mid-western town who responded to the appeal of a voluntary agency for the support of cancer research, for instance, owns a piece of a brick or a test tube in the Research Building. The riveter in an airplane factory in California or Connecticut, the farmer in Georgia or Kansas, the miner in Pennsylvania or Colorado who paid his Federal income tax also owns a piece of a brick, or perhaps even an Erlenmeyer flask!

It is this participation of the Federal Government in building this institution of the commonwealth that gives me the honor, as a public servant, of participating in this ceremony. For the housewives, riveters, farmers, miners, bankers, manufacturers, teachers, physicians, research scientists—the whole body politic of our country—through their representatives in Congress have placed on the Public Health Service the solemn responsibility of carrying out their wishes with respect to expanding medical research.

We in the Executive Branch of the Government undertake to administer the laws enacted by Congress so as to implement and strengthen the democratic principles of individual freedom and cooperative action. As the research scientist is humble before the unknown, so the public servant is humble before society—in many ways the greatest unknown of all. The scientist, himself, is a member of society, and must ever be aware that to him, also, public service is a sacred trust.

The basic problem in our democratic society is to secure effective participation of the people in their government. In a complex, mechanized civilization, a citizen in South Boston, or South Chicago, or Cimarron County, Oklahoma, may be just as remote from his government as is the Indian in the upper reaches of the Amazon. We may have to learn the traffic rules or the garbage collection schedule, but we do not really learn about our legal government—still less about our Federal Government.

Herein lies grave peril to our way of life, a peril which every public servant seeks to avert throughout the gamut of governmental responsibility. The solemnity of the citizen's trust has been well expressed by one of this Nation's greatest public servants, David E. Lilienthal. "I find it impossible," he writes in *Democracy on the march,* "to comprehend how democracy can be a living reality if people are remote from their government and in their daily lives are not made a part of it."

A highly industrialized, highly interdependent society of 150 million people requires a government commensurate in size and complexity with the society's problems. But "big" government is not an end in itself. It exists only to serve its citizens. Service is a local, individual thing. The Federal Government cannot serve effectively unless local government—the citizens of a community acting together—assumes the lion's share of responsibility for the community's own welfare.

For this reason the men and women in Government constantly seek ways to bring this reality to pass—to make democracy work. Obviously, theirs is only part of the task. If citizens do not equally seek to participate in their government, if they do not assume equal responsibility for making democracy work, the cause is lost at the outset. Cooperation between the citizen and his government is essential, but neither partner can take the role of "co-ing" while the other is left to do all the "operating".

We are living in an era of unrest, perhaps unparalleled in modern history. The impact of stress on the human organism is reflected in countless ways, not the least of which is the ambivalent attitude of some individuals and groups—toward government: on the one hand to expect government to be "all things to all men", and on the other to fear every action of government which is directed at solving urgent problems. Mr. Lilienthal warns us that "democracy cannot thrive long in an atmosphere of scorn or fear."

It behooves us then, both as citizens and as specialists in our chosen callings, to do our share in making democracy work. In its research programs, the U.S. Public Health Service, as a part of the national government, has been faced with this problem. We are responsible to Congress for proper distribution of substantial sums. Moreover, the competition for financial support of research is nation-wide —and intense. We must administer these funds so as to ensure all of the freedoms essential to scientific progress—including the freedom of institutions and scientists to plan and conduct their programs without interference. The democratic principle of broad participation by interested citizens from all parts of the country makes it possible to discharge this dual trust.

In the specialized area of medical research, Federal participation, through the Public Health Service, is linked back to society by our advisory councils. Congress has created seven such councils with a membership of nearly 100 scientists, physicians, educators, and leaders in public affairs who have no other connection with the Government. Every one of these councils includes non-technical public members. Every council has a rotating membership. So it is that citizens and universities, medical and dental schools, hospitals, and other institutions participate in their Government.

Our advisory councils have broad statutory responsibilities—not only for reviewing and recommending specific research grants, but further to assist the Public Health Service in shaping its policies and programs. The councils have thus played a decisive role in the development of our research grants and fellowship program, our aid to professional education in cancer, cardiovascular disease, and mental health, and our control programs in the same fields.

Grants for the construction of research facilities were authorized by the Congress because of the action of the National Advisory Cancer Council. The Council felt that such a program was essential to any fundamental advances in the field of cancer research. Subsequently, the National Advisory Heart Council adopted the same policy. As a result, your Government has contributed substantially to the construction of the Research Building we are now dedicating.

Many thousands of applications for research grants are received by the Public Health Service each year. A system of seventeen study sections composed of scientists from institutions located all over the country review these applications from the technical standpoint before the Councils consider them. The memberships on study sections also are rotating. The 250 men and women on these study sections also help us identify gap areas in medical research which need emphasis. Thus the Public Health Service research program belongs to our whole society.

The Public Health Service is not simply a passive partner in this enterprise. Nor is it simply a disperser of funds. Throughout its history it has been an active partner in many programs—beginning here in Massachusetts, when our first Marine Hospital served Dr. Benjamin Waterhouse as the first teaching hospital for Harvard Medical students. For many years physicians and other personnel of the Service have worked at Massachusetts General, in cooperative projects.

Let us remember, then, that cooperation between citizens' institutions and government is a dynamic factor in democracy. In the intricate and ever-broadening field of medical research, no one source of support, no one type of institution will solve the health problems of the human race. Diversity of support ensures diversity of investigation, diversity of approach —and maximum results. As each research group has its particular problems to solve, so each institution has its unique contribution to make—the technical service of the Government no less than the voluntary agency or institution.

The splendid laboratory we are dedicating today has risen from such cooperation: Massachusetts General Hospital planning, building, operating; the people of this country, directly —or indirectly through their Government—aiding. Our democratic freedoms ensure that the advances made here will bless with better health and healing the people of this country and round the world. For this is indeed an institution of the commonwealth and, as such, an institution for the common health.

Recent gifts to the Archives Department:—

From Miss Agnes J. Chatfield of Rutland, Mass.—a copy of the 1st Edition of Bowditch's *History of Massachusetts General Hospital,* published in 1851.

From Dr. Henry C. Marble—2 glass transfusion tubes, used in the early 1900's.

From Dr. A. William Reggio—a framed colored reproduction of a picture of the Bulfinch Building used in Hinton's *History and topography of the U. S.,* published in England in 1830. This copy of the picture hangs in the Director's Office.

From Miss Mary Channing Rogers, great-granddaughter of Paul Revere—4 silver spoons which belonged to Sarah Clough, "for many years a valued and confidential domestic in the family of Joseph W. Revere, Esq., of this city." This appraisal of Miss Clough is from Bowditch's *History of the Massachusetts General Hospital.* Bowditch says further that Miss Clough "bequeathed to this institution the residue of her property, the little savings of her own personal labors. The amount which has been paid to the Treasurer, pursuant to this bequest, is $599.84. There never has been a donation, whatever its magnitude, more honorable either to the donor or to the institution." Miss Clough's name is engraved on the backs of the spoons. Miss Anna P. Revere, a member of our Ladies' Visiting Committee and a cousin of Miss Rogers, brought the spoons to the Archives Department.

Miss Ruth Sleeper, R.N.,
Director of the School of Nursing and Nursing Service

Dr. Churchill received this interesting letter from Lt. Robert W. Hopkins, MC, USNR (*S* 1948), and passed it on for all of us to enjoy.

> We've been up here in the North Country for a month and a half now. There is little excitement but much of interest. Unfortunately, most of what we eat, see, and do is classified (though I doubt if it is effective), and any detailed general description is forbidden.
>
> Thus far I have lost no hands or feet from frostbite, nor has anyone else. While the first thing one thinks about in Arctic medicine is frostbite, it is virtually no problem at all here. Adequate protection is almost second nature to all personnel here, and Chicago and Korea outdo us by far in the production of cold weather injury. This is really a rather healthful climate.
>
> The medical set-up for the district is very interesting. There is a doctor provided by the government to care for the native population of the region. Each fall and spring (when it is usually well below zero) he hitches up his dogs and makes three or four trips, of several weeks each, around the area, tuberculin testing, inoculating with BCG, and seeing whatever illness he might run into in the scattered population.
>
> The one scourge of the area, and a difficult one to handle, is tbc. There is no available X-ray, no adequate facilities for isolation, no sanitary control, no streptomycin. Perhaps strangely, the diagnosis of pulmonary tbc is rarely made. It may be suspected, and hemoptysis is the leading cause for suspicion. But advanced or obvious disease of the lungs is apparently relatively rare, and the red bugs are not often seen in the sputum. They are apparently there and active, however, for many of the children have picked them up from the dirty floors, and the bacteria have lodged with frequency and tenacity in lymph nodes and spines. The unfortunate victims usually have a definite kyphos and sometimes a paraplegia when seen. They are then packed into the "hospital" and encased in plaster for six months or more if they will tolerate it. Treatment is strictly by guess and by God—necessary, but rather a blind approach for those of us who take X-ray for granted.
>
> I had a good time covering for the local doctor while he was away. Like the old country doc in his sleigh, and with the wind and snow traveling at 30 to 90 m.p.h., I went to see a native infant who was sick with pneumonia. We country docs do deserve a bit of credit. Diagnosis isn't quite so easy in the sticks, and I was rather pleased when I substantiated mine the next day by throat smear—pneumococci probably smuggled into the area by one of us. The effect of penicillin was quite dramatic.
>
> I expect to be back in the middle of June and will drop into the M.G.H. as soon afterward as I can.

This nice note has come from Dr. Alphonso L. d'Abreu, Visiting Surgeon pro tem from January to March of 1951. His address is 58 Calthorpe Road, Edgbaston, Birmingham 15, England, and he writes:

> It was so kind of you to send me a copy of The News. I was delighted to receive it. It is really an excellent paper, and it makes me feel quite homesick for the Massachusetts General Hospital, where I had a wonderful time in an atmosphere of the greatest friendliness. I am asking my bank to arrange for the transport of some dollars so that I can become a subscriber to The News.

Dr. Clay received this letter from Dr. William D. Shorey (*ES* 1946). It bears the address American University of Beirut, Beirut, Lebanon, and says in part:

> Following a very successful trip we arrived in Beirut early in December, and after a month's orientation I took over the chairmanship of the Department of Surgery and the acting chairmanship of the Department of Gynecology and Obstetrics. The latter was a bonus, due to the illness of the Obstetrical Chairman, and between the two departments I have been quite busy.
>
> Beirut is a lovely town in a most beautiful setting, underneath the shadow of some high snow-capped mountains. It combines the Eastern and Western ways of living. We are very comfortably ensconced in our apartment near the hospital compound. On the 6th of February we had a baby boy who is doing very well.
>
> The types of patients seen here are extremely varied, with many congenital anomalies. It is really a marvelous opportunity to broaden one's experience and to obtain some insight into the problems of teaching and the administration of a department.

This report arrived from Lt. Adolph L. Gundersen (*a. res. S*).

> Date of Commission: 20 Nov. 1950.
> Active duty: 15 March 1951.
>
> To Chelsea Naval Hospital for indoctrination, where I was assigned to the General Surgical Service.
>
> Change of duty: To Naval Academy, Annapolis, Maryland, 21 April 1951 for Dispensary duty. My address here will be A. L. Gundersen, Lt. (j.g.), MC, USNR, Naval Academy, Annapolis, Md.

This letter will be of special interest to the rapscallions who were responsible for that pirated edition of The News which appeared a few months ago. The letter comes from Dr. Pierre E. P. Vandevelde, 12 Place Marguerite, Louvain, Belgium.

> Waves of the immense laugh produced by the "97A" issue of The News have even reached the small Belgium coast and could be registered, although attenuated, in the University Hospital at Louvain.
>
> Being editor in Louvain of a publication similar to your News, I would be very glad to receive, if possible, a sample of your "97A" issue.
>
> I am very proud to be coming to the M.G.H. next January as Clinical and Research Fellow in Surgery.

THE NEWS

No. 104 Boston, Mass. September 1951

MEDICAL SERVICE AFFAIRS

It was three years ago that a report on Medical Service affairs was last made in this column. At that time we were in an expansive mood, looking for greater spheres of usefulness. The hospital was searching for a successor to Dr. Faxon, and hoped to secure a medical statesman with special understanding of the hospital's opportunity to serve the whole community. A year later it succeeded, brilliantly, by obtaining Dr. Dean A. Clark. Plans were being made to bring outlying hospitals into relation with our medical center through rotation of house staff, this to be accomplished by increasing the number of our house officers still farther. Then, a year ago the blight of war again descended upon us. A small, but very bloody war, and the fear of a greater one has again occasioned the syphoning off of our house staff to do their duty in the armed forces. Planning for greater community service goes on, but sometimes action has to be deferred. The plans for a Family Health Service involving Harvard Medical School and Massachusetts General Hospital under Dr. David D. Rutstein's leadership is one of the most promising projects, and we hope that despite the war threat, it can be accomplished. A rotation of an Assistant Resident through the Salem Hospital, begun in 1950, has proved most successful. We hope it can be continued, but that all depends on how many doctors the armed forces allow us.

In the area of teaching no important curricular changes have been made, but we believe that the opportunities to learn are constantly being widened. The presence in our wards of visiting physicians of varied skills and viewpoints cannot but enrich the educational process. We have, for example, internists in private practice, full-time teachers and investigators in medicine, and preventive medicine people, all doing their trick of ward duty. Each has something peculiarly his own to offer. This variety is bound to be provocative to students and house staff. For one month, October 1949, we had a distinguished professor of medicine from Leiden, Holland, Andries Querido, serve as physician pro tempore on one of our wards.

There is abundant opportunity for further improvement in our educational program. If the Harvard Medical School would modernize its curriculum, some constructive changes could be made here at the Massachusetts General Hospital, as well, we believe, as in the other teaching hospitals. If the ward clerkship, for example, could be offered in the third year, students would be more advanced at the beginning of the fourth, and could be given more responsible work in clinics, field, or laboratories, which their greater experience would enable them to handle effectively.

The postwar research crescendo culminating in the opening of the Research Building has, of course, been an all hospital affair. The Medical Services, however, have played an important role in it. In the new quarters those working in the fields of cancer, arthritis, and heart disease will have the most *de luxe* laboratory facilities and equipment imaginable. They must take care that they don't go soft in them.

Some of our medical investigators must carry on in less sumptuous, though adequate, environments — some in the Domestic Building, some in the attic of the Bulfinch, some in the Bulfinch cellar. The last mentioned, now housing the research laboratories of the thyroidological group, is the only really unsalubrious spot in the lot. The gradual infiltration by the laundry is the factor chiefly responsible for the undesirable quality of this territory. Laundry trucks, laundry smells, scientific research and patients visiting labs, make an admixture as unholy as that of the proverbial skunk at the lawn party. The writer, through the administrations of four Directors, has begged for relief from this nuisance, and they in turn have importuned the Trustees. But the net result of all these efforts, over a period of nearly thirty years, is that one Trustee has written a poem, an amusing poem, about the laundry, which thus far has had no other effect than to be amusing. However, we can still take heart in the fact that good work is being done despite these drawbacks. Also, the memory of an episode which occurred in the middle thirties has always been comforting. A physician visiting us from England, on being shown the thyroid research laboratories remarked, "Oh I say, thank God, at last I have found a lab in the States that doesn't stink of money!"

In the Out-Patient Department Dr. Earle M. Chapman has continued to render devoted service in improving the organization and arrangements. The dispensary principle introduced by Dr. Joseph S. Lichty in March 1949 has been continued, but the scene changed in March of this year. The sorting of patients was moved to the desks in the medical and surgical clinics, and dispensary type patients are there assigned to one of the Assistant Residents for prompt treatment. In the medical clinic the dispensary patients are saved both time and walking by having a cashier directly in the clinic. The charges now are $5 for new patients in the regular clinic, $2.50 for return visits, but only $1 for dispensary care. This does not mean that an inferior type of medical care is offered certain patients, but rather that patients with what seem to be trivial maladies can be cared for expeditiously but skillfully. Certain physical changes in the Out-Patient medical clinics quarters are also facilitating the sorting and care of patients.

Mention should be made of alterations affecting Ward 4. As has been recorded previously in THE NEWS, this ward on March 21, 1949 was named in honor of one of its chief benefactors "The Mallinckrodt Ward". Until May of 1951 a main corridor ran directly through this ward — an undersirable but unavoidable arrangement. Fortunately, lately in connection with the new Research Building it has been possible to construct a corridor which by-passes Ward 4 and provides a good entry to the Research Building, and incidentally greatly increases the peace and comfort of the patients in Ward 4 and also of the personnel at work there. Moreover, it is expected that presently the ward's capacity will be increased from ten to sixteen beds by converting into ward use the space vacated by laboratories to the east of it which now have been moved to the Research Building. These changes have been made possible by further generous gifts on the part of Mr. Mallinckrodt.

Thus the half-century mark finds the Medical Service going strong in its treble function of care of patients, teaching, and research, and the writer, who has found great happiness in administering its affairs since 1923, turns it over to his friend and successor, Walter Bauer, with a heart full of gratitude and the utmost confidence that under his leadership it will reach new heights of accomplishment.

J. H. Means, M.D.

[Dr. Means wrote the above article in June 1951, while he was still Chief of Medical Services. Since it was not received until after our July – August issue had gone to press, it could not appear in that number, as we had planned. We have given it to you now, at the earliest opportunity. *Editor*]

⁂

Dr. Mary A. B. Brazier, Neurophysiologist in the Departments of Psychiatry and Anesthesia at M.G.H., was reelected Treasurer of the American Electroencephalographic Society at the last annual meeting.

Dr. John A. Abbott, Assistant Neurologist on our staff, was re-elected Secretary.

FERTILITY AND STERILITY CLINIC

As an adjunct to the long-established Ovarian Dysfunction Clinic, the Fertility and Sterility Clinic was organized approximately twelve years ago in the Out-Patient Department, meeting on Monday afternoons throughout the year except in August. Here are seen those couples complaining of infertility, repeated miscarriages, habitual abortion, and, occasionally, marital problems relating to infertility. Throughout the year the Clinic is visited by doctors from this country and abroad who are interested in this field. Endocrinologists visiting Dr. Albright often study our methods of investigating infertility.

The scope of investigation includes a complete study of both the husband and wife, as it has been well established that in up to 40% of marriages the husband may be the factor in infertility. Approximately 60% of the husbands seen have lower than normal semen examinations, and approximately 13% of these husbands have complete azoospermia or absence of any sperm. The causes for this vary from obstruction due to venereal disease, obstruction due to congenital anomalies, exposure to toxic elements such as X-ray, and primary failure of the testis itself from endocrine causes or as the result of mumps orchitis bilateral.

Examination of the husband

The detailed study of the husband includes a complete history and physical examination, with attention to all systems. The physical examination is supplemented by at least one and frequently two semen analyses where the volume, sperm count, motility, and morphology are evaluated. Normal semen analysis should include two to six cc. of fluid, containing 60,000,000 or better spermatozoa per cc., 60% of them actively motile two hours after production, and 70% normal morphology.

In addition, basal metabolic rates are usually secured, and testicular biopsy is often indicated and performed. Urinary assays for follicle-stimulating hormone and 17-ketosteroid assay are routinely carried out in those men who have oligospermia or azoospermia.

The examination of the couple is not complete without including in the husband's record the results of the postcoital examination of the cervical mucus, which is a test to determine whether or not the spermatozoa survive in the cervical mucus of the wife at the time of ovulation.

Treatment of the husband

Even though the husband has a normal semen analysis it is frequently necessary to treat the individual on the basis of his habits, occupation, or exposure to noxious influences. These men are urged to omit tobacco and alcohol, get regular exercise, lose weight if they are obese, and gain weight if they are underweight. Spacing of intercourse in relation to the ovulatory time of the wife is advised. Occasionally, irrigation of the vas deferens relieves azoospermia, and occasionally epididymovasostomy restores normal patency to tubes previously blocked as the result of venereal disease.

In the handling of cases of repeated miscarriages or habitual abortion, it has been demonstrated that often the potential source of the difficulty lies on the husband's side. In these cases, even though a history and physical examination revealed no abnormality, and the semen analysis is normal, attention to the basal metabolic rate and blood count frequently reveals a marked lowering of the metabolism. When these men are treated with thyroid over a long period of time, the next pregnancy often results in a normal delivery. These patients are particularly grateful.

In addition to the diagnostic study of the infertile male, another large group of the male population under study consists of those with varying degrees of testicular dysfunction. These, also, are investigated in our Clinic by means of testicular biopsy and urine assay for follicle-stimulating hormones and 17-ketosteroids. A selected group of these patients who have been labeled with a diagnosis of eunuchoidism with negative follicle-stimulating hormone have shown on testicular biopsy immature testes which have never been stimulated. By treating these men with a combination of chorionic gonadotrophic hormone, methyltestosterone, and sometimes thyroid, we have been able to improve these men from complete azoospermia to an essentially normal semen specimen, and two of these patients have become parents. Two other patients, unmarried, have started with no sperm and have developed normal sperm counts. Over 560 testicular biopsies have now been studied with the cooperation of Dr. Palmer Howard, formerly connected with the Ovarian Dysfunction Clinic but now at the Oklahoma Research Foundation, Oklahoma City, and Dr. Ronald C. Sniffen of our Department of Pathology. From these cases, six papers have been published in the current medical literature.

Often these cases are seen in consultation with someone from the Psychiatric Department, the Urological Department, and the North End Diet Kitchen, to correct matters of a psychosomatic, a urological, or a nutritional nature.

Investigation of the wife

Wives complaining of infertility also receive a complete history and physical examination, with particular attention paid to the obvious signs of endocrine abnormality, the pelvic examination, and the nutritional status of the individual. Specific tests which are indicated include a test of the fallopian tubes for patency, frequently called the Rubin's test or insufflation of the tubes. This is carried out with carbon dioxide gas under pressure, and if two of these tests are unsuccessful a uterotubogram or filling of the tubes with an opaque medium, followed by X-ray studies of the uterus and tubes, is carried out. Another important test is the taking of a sample of tissue from the lining of the uterus or endometrium, as it is called. This procedure is called an endometrial biopsy, and allows one to state whether or not the individual has ovulated that particular cycle and whether the uterus is responding properly to the stimulation from the hormones released by ovulation. A third important test is a postcoital examination of the cervical mucus to determine whether or not the spermatozoa survive in the cervical mucus of the particular wife in question. Routine basal metabolic determinations are carried out, complete bloods, urine analysis, and blood Wassermann.

The patients are instructed in the preparation of a basal body temperature chart, measuring the morning temperature on a graph which allows one to determine whether or not ovulation is occurring and what time of the month it does occur. This enables the patients to select the proper time of the month for observation of the optimum time for fertility. Occasionally when the tubes have been demonstrated to be non-patent, the patients are admitted to the House for surgical investigation of this disorder. Occasionally when the studies indicate that the patients are suffering from anovulatory cycles, the patients are also sent to the surgical ward for exploration of the ovaries and reconstructive surgery.

The Clinic has suffered from the loss of Dr. Somers H. Sturgis, long connected with the Gynecological Service, who has recently transferred to the Gynecological Service of the Peter Bent Brigham Hospital. He supervised the rapid rat test for pregnancy in the Vincent Memorial Laboratory, handled those cases where culdoscopy was indicated, and helped on many of the difficult problems of anovulation.

At present the Clinic is testing the use of the Kidde insufflation apparatus for manometric control of the passage of carbon dioxide gas through the fallopian tubes. In the fall when the Clinic reopens, arrangements have been made to test the Weisman gynograph, which allows us to insufflate the tubes with carbon dioxide gas or to use a radio-opaque material, transferring from one to the other at will. This should be an advance in the diagnostic acumen of the Clinic.

Treatment of the wife

Routine treatment of the wife includes, of course, correction of known obvious defects, attention to diet, obesity, lack of thyroid, and nutrition. Cauterization of the cervix is used as therapy, and often a retrodisplaced or retroverted uterus is manipulated to normal position and held there by means of a Smith-Hodge pessary. The patients are instructed in the use of a precoital douche, which is said to have a mechanical cleansing action and increases the favorable alkalinity of the cervical mucus. A small number of patients are sent into the hospital for surgical maneuvers, varying from dilating an intact hymen or dilating a stenotic cervix, to exploratory laparotomy, with resection of ovarian cysts, occasionally tumors, and plastic surgery to the tubes. Fibroid tumors of the uterus are removed surgically.

When all the studies on both partners have been completed, the situation is summarized and a course of treatment is laid out for the couple.

Purpose of the Clinic

It is hoped that this brief report will stimulate other departments of the Hospital to refer to the Sterility Clinic those patients who are anxious to have children and those who have problems relating to reproduction. In addition to helping such patients to achieve parenthood, the Clinic is interested in studying problems of ovulation, testicular dysfunction, and other abnormalities of the reproductive life of the human being.

It is hoped that the time will come when the Clinic may add to its services those on marriage counseling, the spacing of children, and the improvement in hygiene of the married couple. Certain of these functions obviously depend upon changes in legislation of the Commonwealth of Massachusetts.

Under the guidance of Dr. Fuller Albright and Dr. Joe V. Meigs, facilities exist for those of the Resident Staff who wish to learn the diagnostic and therapeutic procedures related to the study of the infertile couple, to secure a firm groundwork in the modern investigation of infertility.

There is a crying need for a volunteer social worker or secretary who could devote time to taking a more detailed social and environmental history on these patients, and to teach them the mechanics of recording the basal body temperatures. No funds exist for the carrying on of this work. The services of all of the workers are voluntary. Contributions of any nature are welcome.

Fred A. Simmons, M.D.,
Head of Fertility and Sterility Clinic

The Board of Trustees, at their meetings during June and on July 13, voted:

To accept with regret the resignation of Dr. Lowrey F. Davenport, Assistant Physician, effective July 1;

To accept the resignation of Dr. Eugene Kennedy, Assistant in Biochemical Research;

To accept the resignation of Dr. Arthur H. Rosenbloom, First Assistant Resident in Pathology, effective July 1;

To promote Dr. Daniel C. Dawes to Assistant Psychiatrist;

To grant leave of absence to Dr. Vincent P. Perlo, Assistant in Neurology, until the end of his current appointment, with the understanding that he be reappointed to the same position in February 1952, with an extension of his leave during the time he is in service with the U. S. Army;

To grant leave of absence to Dr. Paul L. Sweet, Clinical Assistant in Dentistry, until the end of his current appointment, with the understanding that he be reappointed to the same position in February 1952, with an extension of his leave during his service in the U. S. Navy;

To grant leave of absence to Dr. Vernon Thomas, Assistant Anesthetist, from August 1 until the completion of his current appointment.

To appoint:

Dr. Louis Bakay as Senior Resident in Neurosurgery for the period July 1 – December 31;

Dr. Wilma J. Canada as Assistant Resident in Radiology, beginning January 1, 1952;

Dr. Abraham L. Finesinger as Assistant in Psychiatry;

Dr. Jordi Folch-Pi as a member of the Committee on Research;

Dr. Fairfield Goodale, Jr. as Second Assistant Resident in Pathology, to begin July 1;

Dr. Walter C. Guralnick as Dental Surgeon;

Dr. James P. Isaacs as Assistant Resident in Anesthesia for one year, beginning July 1;

Dr. Robert W. Mackie as Assistant Resident in Neurosurgery for the period July 10 – December 31;

Dr. Walter W. Point, III as Assistant in Medicine;

Dr. Frederick C. Robbins as Assistant to the Children's Medical Service;

Dr. Bertram Selverstone as Clinical Associate in Neurosurgery as of July 1, when he goes to the New England Medical Center;

Dr. William H. Timberlake as Assistant in Neurology, as of July 1;

Dr. James H. Townsend as a member of the Board of Consultation.

The Trustees also voted:

To put Dr. Raymond D. Adams in charge of the Electroencephalographic Laboratory;

To grant a Dalton Scholarship to Dr. Jaimie S. Rodriguez with a stipend of $125 per month for six months, beginning June 1, to carry on research in thyroid cancer;

To appoint a permanent Animal Farm Committee consisting of Dr. William Clark, Chairman; Dr. Charles L. Clay, Secretary; Drs. Frantz and McDermott; and Dr. C. L. Blakely of the Angell Memorial Hospital;

That $1,000 be allocated from MGH Fund-Cancer to Dr. Chester N. Frazier, to replace the amount taken from his allocation under the ACS Institutional Grant;

To appoint Miss Sigrid Edge, Mrs. Thorwald Ross, and Mrs. Ralph Wetmore to the Advisory Committee to the School of Nursing, to succeed Miss Frances Dugan, Mrs. Arthur W. Bell, and Mrs. G. Tappan Francis, resigned.

At their meetings on June 13, 20, and 27, July 11, and August 1, the General Executive Committee voted:

To accept the resignation of Dr. Armand L. Bengle from the position of Clinical and Research Fellow in Anesthesia, effective July 1.

To promote:

Dr. Richard C. Austin from the position of Intern to the rank of Third Assistant Resident on the Surgical Service, effective July 1;

Dr. Benjamin A. Barnes from the position of Second Assistant Resident to the rank of First Assistant Resident in Surgery, effective July 1;

Dr. Robert C. Coe from the position of Intern to the rank of Third Assistant Resident on the Surgical Service, effective July 1;

Dr. Richard A. Currie from the position of Third Assistant Resident to the rank of Second Assistant Resident in Surgery, effective July 1;

Dr. Frank W. Garran, Jr. from the position of Intern to the rank of Third Assistant Resident on the Surgical Service, effective July 1;

Dr. John M. Head from the position of Intern to the rank of Third Assistant Resident on the Surgical Service, effective July 1;

Dr. George S. Richardson from the position of Third Assistant Resident to the rank of Second Assistant Resident in Surgery, effective July 1;

Dr. David B. Sheldon from the position of Intern to the rank of Third Assistant Resident on the Surgical Service, effective July 1;

Dr. Morten Smith-Petersen to the position of Senior Resident on the Orthopedic Service for the year beginning January 1, 1952;

Dr. Eji Suyama from the position of Intern to the rank of Third Assistant Resident on the Surgical Service, effective July 1.

To reappoint:

Dr. Daniel Joly as Clinical and Research Fellow in Surgery for three months, beginning July 1;

Dr. David Kahn as Clinical and Research Fellow in Pathology for one year, beginning July 1.

To appoint:

Dr. Hermann H. W. Baumann as Clinical Fellow in Psychiatry, beginning July 1;

Dr. Ellen Bell as Clinical Fellow in Pediatrics, effective July 1;

Dr. Van Boring Bennett as Clinical and Research Fellow in Medicine, assigned to Cardiology, for the period July 1 – December 31;

Dr. Lester J. Bienvenu as Clinical Assistant in Dermatology for the year beginning July 1;

Dr. Agnes S. Burt as Research Fellow in Pathology for one year, beginning July 1;

Dr. Mack L. Clayton as Clinical Assistant in Orthopedic Surgery for one year, beginning August 1;

Dr. Goodman Cohen as Clinical and Research Fellow in Medicine, assigned to Cardiology, effective July 1 – September 30;

Dr. Sybil Corbett as Clinical Assistant in Medicine, assigned to the Allergy Clinic, for the period July 1 – December 31;

Dr. Charles G. Craddock, Jr. as Clinical Fellow in Psychiatry, effective June 1;

Dr. George J. Cunningham as Clinical and Research Fellow in Pathology for one year, beginning September 15;

Dr. Jose Delgado as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;

Dr. Earle K. Harris as Clinical Fellow in Surgery, assigned to the Tumor Clinic, beginning July 1;

Dr. Frederic L. Hoch as Research Fellow in Biochemical Research, beginning September 1;

Dr. Hedvig H. Holger as Clinical Fellow in Psychiatry, beginning September 1;

Dr. Ruth Jaffe as Clinical Fellow in Psychiatry, beginning September 1;

Dr. Ruth Jens as Research Fellow in Neurology, assigned to the Electroencephalographic Laboratory, for four months, beginning September 1;

Dr. Henry Walter Jones, Jr. as Clinical Assistant in Medicine, effective October 1;

Dr. Charles S. Keuper as Clinical Fellow in Psychiatry, effective July 1;

Dr. Owen W. Kite as Clinical Assistant in Dentistry, effective July 1;

Dr. John Lindenberg as Clinical and Research Fellow in Surgery, for the period June 25 – August 15;

Mr. Alden V. Loud as Research Fellow in Medicine and Neurosurgery, beginning June 11, to work with Drs. William H. Sweet and Ivan D. Frantz, Jr.;

Dr. Samuel G. McClellan as Clinical Fellow in Psychiatry, beginning July 1;

Dr. Sherman W. McIlmoyl as Graduate Student Assistant in Surgery for one month, beginning June 4;

Dr. Jorge A. Maisterrena as Clinical Fellow in Medicine, effective June 1;

Dr. David V. Mann as Clinical Fellow in Dermatology for one year, beginning July 1;

Dr. Vernon H. Mark as Clinical and Research Fellow in Neurosurgery, effective July 1;

Dr. Simon E. Markovich as Research Fellow in Neurology, assigned to the Electroencephalographic Laboratory, for six months, beginning July 1;

Dr. Leon J. Marks as Research Fellow in Pediatrics, to work with Dr. Talbot's metabolic group, effective July 1;

Dr. Joseph E. Murray as Clinical Fellow in Surgery, assigned to the Plastic Clinic, effective July 1;

Dr. George F. Odland as Clinical and Re-

search Fellow in Dermatology for one year, beginning July 1;
- Dr. Juan V. Pena as Clinical Fellow in Surgery, assigned to Endoscopy, for the period September 4 – December 4;
- Dr. Raymond V. Randall as Clinical and Research Fellow in Medicine, assigned to Cardiology, beginning July 1;
- Dr. Victor M. Rodriguez as Clinical Student Assistant in Surgery for three months, effective April 9;
- Dr. Arthur H. Rosenbloom as Clinical Assistant in Medicine for one year, beginning August 1;
- Dr. Richard L. Rovit as Clinical and Research Fellow in Surgery for the period July 1, 1951 – June 30, 1952;
- Dr. Nathan E. Silbert as Graduate Student Assistant in Dermatology, effective July 19;
- Dr. Richard B. Streeper as Clinical Fellow in Medicine, assigned to Cardiology, effective July 1;
- Dr. Daniel L. Sutherland as Clinical and Research Fellow in Neurosurgery, effective July 1;
- Dr. Maurice Victor as Clinical and Research Fellow in Neurology, effective July 1;
- Dr. Ruth Weiss as Clinical Fellow in Pediatrics for one year, beginning July 1;
- Dr. Elizabeth R. Zetzel as Clinical Associate in Psychiatry, beginning September 1.

* * *

All of us have noticed and enjoyed the great improvement in the Phillips House and Vincent Memorial courtyards achieved by the grading and attractive plantings.

The Ladies' Visiting Committee has been working for some time to accomplish this, and this spring it was brought to a successful conclusion. The Committee secured the professional services – gratis – of a good friend, Arthur A. Shurcliff, one of New England's leading landscape architects. Contributions to cover the work were received from the Ladies' Visiting Committee and from the Vincent Memorial.

Brief bits:–

- Dr. Fuller Albright, Physician on our staff, was named by the Trustees and Council on Foods and Nutrition of the American Medical Association to receive the Joseph Goldberger Award, at the A.M.A. annual meeting in Atlantic City last June. The Award included a gold medal and a check for $1,000.
- Dr. Edward B. Benedict, Endoscopist at M.G.H., gave a talk on Endoscopy for the South End Medical Club, at the June 19 meeting of the Boston Tuberculosis Association.
- Dr. Carl C. Johnson, Assistant Surgeon in Ophthalmology at the Massachusetts Eye and Ear Infirmary, gave two lectures in the postgraduate course in Ophthalmology and Oto-Laryngology at the University of Kansas Medical Center last April. His subjects were "Ptosis: Diagnosis and management" and "Glaucoma surgery".
- Dr. Jack S. Parker (*WS* 1946) announces the opening of an office for the practice of General and Pediatric Surgery, at 3 Seaward Road, Wellesley Hills, Mass.
- Dr. Fred A. Simmons, Assistant Surgeon on our staff, was elected President of the American Society for the Study of Sterility, at the annual meeting of the Society last June. Dr. Simmons has also been appointed to the Council of the American Therapeutic Society, to serve for a five-year term.
- Dr. James M. Stewart (*M* 1946) announces the opening of his office for the practice of Internal Medicine, at 344 West Ave., Rochester 11, N. Y.

MASSACHUSETTS EYE & EAR INFIRMARY

At the June meeting of the American Medical Association, Dr. Edwin B. Dunphy, Chief of Ophthalmology, was elected Chairman of the Section of Ophthalmology for the 1952 meetings, and Dr. Trygve Gundersen was re-elected Secretary. Dr. David G. Cogan, Director of the Howe Laboratory, was chosen as Chairman of the Association for Research in Ophthalmology.

Miss Isabel Whiting has been appointed Director of the Massachusetts Eye and Ear Social Service Department, replacing Mrs. Eunice Wilson. Miss Whiting, who is a graduate of Wellesley College and holds an M.A. from Columbia University, taught history at the University of Vermont and was Assistant Dean of Women there for three years.

Miss Whiting received her M.S. in Psychiatric Social Work from the Graduate School of Social Work at Smith and came to Massachusetts General as a case worker on the Surgical Service in 1936. Subsequently, she was appointed head social worker on the Tumor Service. In 1944 Miss Whiting became a supervisor in the Department of Social Service and in 1946 she received the title of Administrative Assistant to Mrs. Wilson. Her new appointment at the Infirmary will begin on September 24.

Dr. Jorge de la Torre of Quito, Ecuador, has come to the Infirmary for six months of study in the Department of Oto-Laryngology. He is a graduate of the Central University at Quito and interned at Hospital Eugenio Espeje. Before his present visit to the United States Dr. de la Torre was head of the Division of Oto-Laryngology at the Social Security Department of Quito. He is now studying on a fellowship from the W. K. Kellogg Foundation.

Dr. Robert R. Trotter completed his residency on August 1. He has gone to Okinawa where he will join a group, sponsored by the National Research Council, for the study of trachoma.

Dr. Samuel T. Adams, who completed his residency last spring, left the Infirmary in August to return to Montreal where he will go into private practice in Ophthalmology.

Dr. Hugo D. Angelini has entered private practice in Hartford, Connecticut, having completed his term of residency in the Department of Oto-Laryngology this summer.

THYROID CLINIC

An expedition was sent out from the Thyroid Clinic of M.G.H. last June, to study goiter as it occurs in the foothills of the Andes in Argentina. Dr. Means has given us the following information regarding the project:

The group from M.G.H. is collaborating with a group of Argentinian doctors, and the work is being done at Mendoza, Argentina, where is located the University of Cuyo. The objective is to study iodine-want goiter by modern methods, particularly making use of radioactive iodine. The group from here is headed by Dr. John B. Stanbury, Assistant Physician at M.G.H. and now in charge of our Thyroid Clinic. He is accompanied by Dr. Gordon L. Brownell, Associate in Physics on our staff, and Dr. Douglas S. Riggs of the Department of Pharmacology at Harvard. Miss Eleanor Brown went as technician. The Argentinian members of the group include Dr. Hector Perinetti, Surgeon of Mendoza, Dr. Enrique B. del Castillo, Endocrinologist of Buenos Aires, and Drs. Trucco and Houssay, also of Buenos Aires.

Funds for this enterprise were contributed by the Rockefeller Foundation, the Loomis Foundation, and Parke Davis & Co. The Atomic Energy Commission is supplying radio-active iodine, which is flown down at regular intervals to the workers at Mendoza. All the equipment was sent to Argentina from the United States, and the plan is to sell it to the Argentinian Government after the work of the expedition is concluded. The Argentinian members of the group wish to set up a radio-iodine laboratory in their own country. Governmental agencies concerned gave their approval to the expedition, and we are all regarding it as a joint U. S.-Argentine affair.

The expedition took origin from a visit to our clinic by Dr. Perinetti about a year ago. He showed us photographs of enormous goiters from the Andes, and then and there the idea was born that here was a golden opportunity to study a vanishing disease. The interest is not in the area of prophylaxis or treatment, but in the fundamental physiology of the thyroid gland.

The expedition also has the blessing of the Committee on International Scientific Publication of the National Research Council, of which Dr. Means is Vice Chairman. It is believed that the expedition will indirectly promote the purposes of this Committee. As they travel, the members of the group will give lectures at various important centers.

The expedition is significant because, so far as we can recall, this is the first instance in which M.G.H. has sent forth a task force to collaborate with scientists in another country in a program of scientific research.

The expedition left the U. S. on June 10 and expects to return about the middle of September. The first report from our group is given in this letter from Dr.

Stanbury to Dr. Means, dated June 22.

You may well imagine, from the long delay in my writing you, that we have had a very busy time of it. I might say, to begin with, that our trip so far has been highly successful and there have been only a very few minor hitches. The worst of these happened about an hour ago, when our first shipment of RaI arrived without a sign of a calibration. This is going to delay us until we can get a cable back from Oak Ridge. I can't imagine whatever happened to it.

Our trip to Lima was pleasant and exciting, though we didn't get much sleep that night. We found it an interesting old town, full of curiosities of the past and quite charged with a lot of interest in human physiology. We were met at the airport by Dr. Paul, who is chief of the field party there of the USPH, and by Dr. Hurtado, the high-altitude physiologist. They left us to our own devices for the morning, and in the afternoon took us round the town. In the evening there was a cocktail party for us at the golf club, where we met the medical people of the city. The next morning we spent at the laboratory of Dr. Hurtado and that of Dr. Monke. Both are interested in high-altitude physiology and pathological physiology, and work part of the time at the high-altitude physiological station in the mountains behind Lima. Doug gave his lecture to the students on that morning. We found the labs remarkably well equipped. They have instruments of the very latest design, rather putting to shame some of the things we have been doing out at the school. We thought we were doing very well to have a single-channel electrograph and a single-strain gauge manometer. In Hurtado's place we found a 4-channel electrograph and a pair of manometers!

In the afternoon we were taken to dinner and then to see the Inca ruins just south of Lima – found them interesting. Eleanor found a femur, brought it back to the hotel, and then forgot it when we left the next morning. My lecture was in the evening, at the spectacular lecture hall of the medical school. After a long introduction by the Dean, I stumbled through an hour of things – each sentence being translated as it was given. It really wasn't too bad.

On Wednesday morning we flew to Santiago, where for five very trying days we were entertained and talked to and shown things until we were ready to fall in our tracks – Riggs very nearly did, and Brownell collapsed the last day with a gastroenteritis. Our impressions of Santiago were that it is certainly one of the most beautifully situated places in the world, and that there is an extremely active and interested and excellent group of investigators there. Brownell and Riggs gave a lecture each on the first two days, and on the third night I gave one to the medical society on the practical use of RaI and on the fourth morning on some experimental things we have done. I think our part of the show went off well enough. There seemed to be considerable interest. Certainly, for us, it was worth the trip just to meet Dr. Lipschutz. He was most kind to us, entertained us at luncheon at his house, showed us his library which surpasses anything I have ever seen anywhere, and even at his advanced years came to our lectures. He is surely one of the great scholars of the world. Middleton was very nice to us, Croxatto gave a tea for us, and Luco had us at his house. We hardly had a meal by ourselves. On Sunday I was taken up into the mountains for skiing – a wonderful experience in the sun with the jagged snow-covered Andes all around.

Last Monday Doug and I came on here to Mendoza. Eleanor had come three days earlier to pave the way, and Gordon wanted to come by plane rather than risk the 18-hour train trip with his G-I problem. The Trans-Andean rail trip was an unforgettable experience. We arrived here at midnight dog tired, only to face a dozen members of a delegation headed by Perinetti. They took pity on us and we went directly to our hotel. We are comfortably situated and find that our worst problem is that of not eating too much. It is fantastic what these people eat. It must have a caloric value twice what we ordinarily eat.

Tuesday morning we made our official rounds to the Governor's place where we signed the book, made the usual appropriate felicitations with the Governor, and did the same with the Dean of the medical school at his office. Then we came to the hospital to look the land over here. We are excellently situated in four more-than-adequate labs and an office. In the afternoon we met the plane of the Argentine Air Force which brought our equipment here. You can well imagine the thrill of seeing this, after the many months of uncertainty. The things are all unpacked now, and we are ready to make physical measurements just as soon as we have a calibration on the shipment of RaI.

Yesterday I was officially shown the patient material. All I can say is that it is unbelievable. Imagine seeing in a single day a dozen children in their early teens with large multinodular goiters! If we had dreamed of our clinical material it couldn't have been this good. Of course it remains to be seen how many of these patients have active hyperplasia from current iodine deficiency, but I think it is probably true that most of them do. We will know in a few more days. It will probably be another week before the iodine lab is functional, but this will not delay the start of observations, by any means. We will probably give our first dose of RaI tomorrow, if not later this afternoon.

Our job here has attracted considerable attention in the Argentine press. A delegation is arriving tonight from a new institute of physiology in Buenos Aires, and Dr. del Castillo arrived at six this morning. Dr. Perinetti is a dynamic person who gets things done.

If we don't turn out a good job it will be only our own fault. I should warn you that I understand the Argentine Government is tendering you and Mrs. Means an expense-paid trip to Argentina later in the summer. I only wish you would change your mind and come. They look upon you, of course, as the leader of this group.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted, though less frequently than heretofore. It would save your editor considerable time and trouble if you would remember to include that information.

In answer to a question occasionally asked, your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration – an article written by a member of the Psychiatry Department may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The deadline date for each issue of THE NEWS is the 12th of the preceding month.

All requests for reprints are to go directly to the individual authors, and *not* to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Anesthesia

Briggs, B. D.
Organization of an Inhalation Therapy Department.
Anesth. & Analg. 30:167-173.

Cardiology

Carmichael, D. B., Sprague, H. B., Wyman, S. M., and Bland, E. F.
Acute nonspecific pericarditis: Clinical, laboratory, and follow-up considerations.
Circulation 3:321-331.

Dermatology

Lever, W. F., Schultz, E. L., and Hurley, N. A.
Plasma proteins in various diseases of the skin: Electrophoretic studies.
A. M. A. Arch. Dermat. & Syph. 63:702-728.

General Medicine

Adams, F. D.
Reversible uremia with hypercalcemia due to vitamin-D intoxication.
New England J. Med. 244:590-592.

Krantz, J. C., Jr., Culver, P. J., Carr, C. J., and Jones, C. M.
Sugar alcohols – XXVIII. Toxicologic, pharmacodynamic and clinical observations on tween 80.
Bull. School Med. Univ. Maryland 36:48-56.

Myers, G. S., Scannell, J. G., Wyman, S. M., Dimond, E. G., and Hurst, J. W.
Atypical patent ductus arteriosus with absence of the usual aortic-pulmonary pressure gradient and of the characteristic murmur.
Am. Heart J. 41:819-833.

Paul, O., Myers, G. S., and Campbell, J. A.
The electrocardiogram in congenital heart disease: A preliminary report.
Circulation 3:564-578.

General Surgery

Daland, E. M.
Radiation damage to normal tissues in the diagnosis and treatment of nonmalignant conditions, and its surgical repair.
New England J. Med. 244:959-964.

O'Keeffe, A. F., Warren, R., and Donaldson, G. A.
Venous circulation in lower extremities following femoral vein interruption.
Surgery 29:267-270.

O'Keeffe, A. F., Warren, R., and Hill, R. C.
Alterations in skin temperature of the toes during lumbar sympathectomy.
In Surgical forum: Proceedings of the forum sessions, Thirty-sixth Clinical Congress of the American College of Surgeons, Boston, Mass., October 1950, Philadelphia, W. B. Saunders Co., pp. 391-394.

Laboratory Science

Geyer, R. P., Waddell, W. R., Pendergast, J., and Yee, G. S.
Oxidation of lipides (-$C^{14}00$-) in vivo by extrahepatic rat tissues.
J. Biol. Chem. 190:437-443.

Neurology, Neurosurgery, and Psychiatry

Blom, G. E.
A review of electrocardiographic changes in emotional states, with a clinical note on electrocardiograms of 193 psychotic patients.
J. Nerv. & Ment. Dis. 113:283-300.

Radiology

Hale, DeF. E.
Synovioma: With special reference to the

Dr. James Howard Means
Chief of Medical Services — November 1923 through June 1951

clinical and roentgenologic aspects.
Am. J. Roentgenol. 65:769-777.

Hanelin, J., and Eyler, W. R.
Pulmonary artery thrombosis: Roentgen manifestations.
Radiology 56:689-703.

Holmes, R. B.
Primary tumors of the ureter: Their roentgen diagnostic features.
Radiology 56:520-527.

Hunter, F. T., and Robbins, L. L.
The protection of personnel engaged in roentgenology and radiology: Final report.
New England J. Med. 244:9-13.

Robbins, L. L., Colby, F. H., Sosman, J. L., and Eyler, W. R.
Excretory urography: A clinical trial of a new contrast medium (sodium 3-acetylamino-2, 4, 6-triiodobenzoate).
Radiology 56:684-688.

Miscellaneous

Garland, J.
Fifty years of medical progress: Medicine as a social instrument: Journalism.
New England J. Med. 244:838-844.

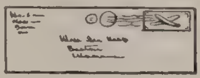
- Dr. Masao Yatsuhashi (*WS* 1945), 66 Beals St., Brookline, Mass.



Dr. Joseph S. Barr, Chief of Orthopedic Surgery, has returned from a six-weeks' European trip and has sent us this account of his journey:

A few days were spent in London, where a two-day orthopedic program was given at the Royal College of Surgeons, under the chairmanship of Sir Harry Platt. I visited the London Hospital and renewed acquaintanceship with W. A. Law, Orthopedic Resident and Clinical Fellow at M.G.H., 1946-48. Scotty Law has established himself as the English master of arthroplasty of the hip. His results rival those of his teacher, Smith-Pete.

The International Congress of Orthopedics and Traumatology was held in Stockholm, May 21 – 25. This was attended by about 400 members and guests from all over the world, including Soviet Russia. One of the main topics of discussion was "Low back and sciatic pain – Results of treatment". The main purpose of my trip was to participate in this symposium. I was favorably impressed with the high standards of medical care, the quality of medical research, and the beautiful hospitals and equipment – all of which are, of course, state-supported and state-controlled.

* * *

Dr. John E. Dalton (*r.p. SM* 1928) sent this letter to the Trustees last May.

I regret that I will not be able to attend the dedication of the Research Building on May 16. It so happens that I am having an earlier resident of the old South Medical Service – Dr. Charles C. Dennie (*D* 1914) – as guest moderator for one of our special monthly clinics on that same date.

Two years ago I was elected Chairman of the Department of Dermato-Syphilology at Indianapolis General Hospital. Since the American Board of Dermatology and Syphilology has awarded our department full accrediting for the training of residents in this specialty and since our service is called upon to conduct all the clinical teaching in this field for students of Indiana University School of Medicine, we have been going through considerable reorganization and development. However, some results from the time and effort spent are now emerging.

This spring has been particularly rugged. As Vice Chairman of the Section of Dermatology and Syphilology of the American Medical Association, I succeeded to the Chairmanship on the untimely death of the duly elected Chairman. This necessitated the preparation of a Chairman's Address for the Atlantic City meeting, along with the many other already existing duties.

Some day, when the deck is cleared, I want to revisit M.G.H. and see all the splendid advances which are being made there.

* * *

This note, welcome though brief, came from Lt. John J. Shea, Jr., MC, USNR, recently Resident in Oto-Laryngology.

I have no important news for The News other than that I am now back in the Navy, in the newly reopened Bainbridge Naval Training Center, as Chief of the Ear, Nose and Throat section of the hospital.

I certainly appreciate The News and read every line just as I would a personal letter.

My new address is USNH, Bainbridge, Maryland.

THE NEWS

No. 105 Boston, Mass. October 1951

THE NEW SURGICAL PRINCIPLE OF THE INCOMPLETELY COVERED FOREIGN BODY AND ITS APPLICATION TO THE EYE

Until very recently it had been thought improbable that a foreign body, incompletely covered by tissue, could be left indefinitely in the human or animal body without extrusion.

HISTORY

Impetus was given the study of this problem during World War II, as a result of the desirability for improving the cosmetic appearance of an artificial eye so far as motility is concerned. In the classical artificial eye there is no attachment between the stump of muscles and the overlying shell, and thus the action of the muscles is transmitted but poorly to the shell. To rectify this defect there was devised in this laboratory, under the auspices of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary, a plastic implant partially surrounded by tantalum meshwork, to which the eye muscles were attached, and having an exposed anterior surface so that a peg from the overlying artificial eye might fit into a hole in the implant. It was found that not only did muscle and connective tissues, as is usual, grow very readily into the tantalum meshwork; but also, surprisingly, the epithelial cells of the conjunctiva, which had been pursestringed around the neck of the exposed area, grew into the edge of the tantalum meshwork and completely sealed off the wound. Thus an effective barrier was created against ingress of both fluids and bacteria; and even though the anterior surface was not covered by tissue, no infections occurred behind the implants.

One hundred seventy-five of these movable implants have been placed at the Massachusetts Eye and Ear Infirmary in the past four and one-half years. There have been no extrusions, and the motility has been practically complete in all. During the first year and one-half, as with any new operative procedure, certain complications were noted. These included some secretion, granulation tissue, and difficulties with performing the secondary implant. With changes in the operative technique and hygiene of the socket these complications have been eliminated to date.

It has been found possible to place a movable implant with excellent results in patients who have had their eyes removed many years previously. The implant has been placed in a patient who had his eye removed thirty-five years before, with good results.

Earlier work on the incompletely covered foreign body was done in dentistry by Strock. He has had a tantalum tooth, exposed on one surface, in a patient's jaw for thirteen years without extrusion.

THE PLASTIC ARTIFICIAL CORNEA

During the past three years work has been progressing in this laboratory on the further study of the fundamental principles involved in the retention of incompletely covered foreign bodies in tissues and on the possible application of this principle to a plastic artificial cornea as a substitute for the eye-bank corneal transplant.

There are approximately 90,000 people in the United States today who are partially or completely blind as a result of scarring of the cornea. Transplantation of the eye-bank cornea can help approximately 16 percent of those operated upon. The failure in 84 percent is due mostly to postoperative clouding of the corneal window or ingrowth of blood vessels into the new graft. It seemed desirable, therefore, to attempt to develop an artificial plastic graft which could not cloud and into which vessels could not grow.

A stimulus was given us for this procedure by an observation made during the war. Several pilots of dive bombers were observed whose plastic cupolas had collapsed and shattered into thousands of minute pieces, with an imbedding of many of these particles in the pilots' corneas. In several cases, the particles were so small and so numerous that removing all of them would have meant the removal of practically the entire cornea. Many of them were therefore left in place, and peculiarly enough they produced very little, if any, reaction. As a result of this observation, it was thought that it would be interesting to determine how the cornea would tolerate larger pieces of plastic.

Three years ago, plastic discs of various shapes and sizes were placed in fifteen rabbits as full thickness grafts. All these grafts extruded within a fourteen-day period.

Fifteen months ago, a different principle was explored. It was decided to attempt to apply a principle learned previously with the incompletely covered plastic mesh postenucleation implant; namely, that it was necessary to keep the tissues in apposition with the mesh with suitable suture material a sufficient period of time for firm fibrosis to take place. To this end, a two-stage procedure was devised. It consists of first incising the cornea at the periphery, splitting the cornea into two layers, sliding the implant between the two layers, and suturing the corneal incision. Later, a trephine hole is made in the front layer and, if necessary, in the back layer. In this way corneal tissue itself holds the disc in place mechanically for a sufficient time for corneal tissue to grow into the holes in the periphery of the disc.

Nine rabbits have been experimented on to date. The first experiment was done fifteen months ago. All the implants have remained in place. The corneas are clear and the eyes white and quiet. Figure #1* shows the plastic disc which is being used at present. Figure #2* shows the scarred cornea of a rabbit after the second stage of the procedure. The hole has been placed in the anterior layer, the eye can be seen into very clearly through the plastic opening, and the rabbit can see out. This photograph was taken at the end of twelve months.

Work is continuing on this project. This is merely the preliminary work and it remains necessary to do a great deal more work on the shape, size, and fabrication of the discs, and to try them on dogs and monkeys, as well as more rabbits. We hope that at the end of two more years we shall be able to offer this procedure to a percentage of the 90.000 people who are now using braille and doing basket weaving and for whom there is no other hope in sight.

William Stone, Jr., M.D.,
Assistant in Ophthalmology,
Massachusetts Eye & Ear Infirmary

*See page 6.

* * *

Dr. Faxon has a new "job", as he calls it. He has been appointed Medical Director of the Massachusetts Regional Blood Program, conducted for the American National Red Cross. The Regional Blood Center is at 314 Dartmouth Street.

We have been told that the English Speaking Union here in Boston is very desirous that all English speaking visitors in this vicinity acquaint the Union of their presence in the U.S.A., to the end that contacts with other visitors from the British Empire may be effected. We are passing on this information for the benefit of those doctors here at M.G.H. to whom this would apply. The Union headquarters are at 33 Commonwealth Avenue.

The tennis court, which used to be at the south end of the Bulfinch lawn, is no more. It has been made into a temporary parking lot to relieve the congestion in the other parking spaces and accommodates 79 cars.

WILFRID J. COMEAU

(1906 – 1951)

Dr. Wilfrid J. Comeau died September 6, 1951, in Bangor, Maine, following a coronary thrombosis. He is survived by his wife, Virginia Tate Comeau, and three children. Dr. Comeau was President of the Maine Heart Association at the time of his death and an outstanding consultant in cardiovascular disease in his community and State.

"Bill" Comeau was born in Worcester, Massachusetts. He received an A.B. degree from Amherst College in 1929 and an M.D. degree from Harvard in 1933. After an internship at the Boston City Hospital he went abroad, where he pursued investigative work with Dr. Ronald Grant at Guy's Hospital in London and with Professor Ludwig Aschoff at the Pathological Institute of the University of Freiburg in Germany.

Upon his return from abroad he came to the Massachusetts General Hospital as Cardiac Research Fellow in 1936, and continued until 1939 as an associate of Dr. Paul D. White and an active participant in the affairs of the Cardiac Clinics and Laboratory. In 1939 he entered private practice in Bangor and rapidly attained a position of prominence and respect in his community. During World War II he entered the Army in 1942 as a major, served in the European Theatre, and was discharged in 1945 with the rank of colonel. Thereafter he resumed his practice in Bangor.

The first indication of cardiac impairment came three years ago, but his recovery was good and his adjustment complete. Although well aware of his precarious future, he carried on conscientiously and courageously to the end. The M. G. H. has lost a loyal alumnus, and the State of Maine a solid citizen.

E. F. B.

[Edward F. Bland, M.D.]

The Board of Trustees, at their meeting on August 3, voted:

To relieve Dr. Tracy B. Mallory of his administrative responsibilities as Chief of the Pathology Department and to retain him as Consultant to the Department; and to appoint Dr. Benjamin Castleman as Acting Chief of the Pathology Department, beginning September 1.

To appoint:

Dr. Alastair J. Gillies as Assistant Resident in Anesthesia for a period of one year, beginning December 10;

Dr. Nicholas M. Greene as Assistant Anesthetist, to begin August 15;

Dr. Edwin C. Hoodless as Assistant Resident on the Orthopedic Service, to begin January 1, 1952;

Dr. Daniel F. Milam, Jr. as Third Assistant Resident on the Surgical Service, as of August 1.

At a previous meeting of the Trustees, William J. Brickley was appointed Consultant in Pathology, and Dr. Michael A. Luongo was appointed Assistant Visiting Pathologist.

At their meetings on June 13 and 20, and July 11, the General Executive Committee voted to appoint:

Dr. George C. Blanchard as Clinical and Research Fellow in Neurosurgery, effective July 1;

Dr. Samuel Brendler as Assistant Resident on the Neurosurgical Service, beginning July 1;

Dr. James L. Buchanan as Clinical Assistant in Surgery for one year, beginning July 1;

Dr. Louis Kunian as Clinical Assistant in Medicine, effective July 1;

Mr. Frank J. Schmetz, Jr. as Research Fellow in Biochemical Research, effective June 11.

* * *

We are always eager to hear about the professional activities of those men and women from other countries after they finish their work here at M.G.H. and return home. Mr. Elias C. Dow, who is working with Drs. James C. White and William H. Sweet on Neurosurgical Research, brought us such information concerning Dr. Bernard J. Harries, a Clinical and Research Fellow in Neurosurgery here in 1950. The information is contained in an article from the spring issue of *The University College Hospital Magazine,* published in England. It tells us that Dr. Harries was appointed to the Consultant Staff at U.C.H. as a general surgeon and took up his duties there on April 1. The article gives an outline of Dr. Harries's preparation for a medical career, his war experiences, and his work here at M.G.H. and at the Neurological Institute in Montreal. It tells us that after his return to the United Kingdom, the Bilton Pollard Fellowship was extended for Dr. Harries, enabling him to do research work in the Pathology Department at the National Hospital, Queen Square, London. All of Dr. Harries's many friends here will be interested in hearing of his recent appointment to the staff of U.C.H.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted, though less frequently than heretofore. It would save your editor considerable time and trouble if you would remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Psychiatry Department may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go directly to the individual authors and *not* to Treadwell Library nor to The News.

The following new titles have been received:

Endoscopy

Benedict, E. B.
Gastroscopic biopsy in the differential diagnosis of gastritis and carcinoma.
New England J. Med. 245:203-206.

General Medicine

Irwin, J. W., Graham, M. J., Jacobson, B. M., and Burrage, W. S.
Penicillin allergy.
New England J. Med. 245:246-248.

Lever, W. F.
Electrophoretic analysis of the plasma proteins in various diseases.
Bull. New England M. Center 13:160-174.

Pittman, H. S., and Kane, L. W.
Fungus infections of the lungs.
M. Clin. North America, Sept.:1323-1331.

General Surgery

Taylor, G. W.
Unnecessarily radical surgery. (Editorial)
Surg., Gynec. & Obst. 93:246-247.

Laboratory Science

Edsall, J. T., and Lever, W. F.
Effects of ions and neutral molecules on fibrin clotting.
J. Biol. Chem. 191:735-756.

Lipmann, F., and DuToit, C. H.
Replacement of thyroxin by its nitro analogue (3, 5, 3′, 5′-tetranitro thyronine). (Abstract)
Science 113:474.

Stadtman, E. R., Doudoroff, M., and Lipmann, F.
The mechanism of acetoacetate synthesis.
J. Biol. Chem. 191:377-382.

Stadtman, E. R., Novelli, G. D., and Lipmann, F.
Coenzyme A function in and acetyl transfer by the phosphotransacetylase system.
J. Biol. Chem. 191:365-376.

Neurology, Neurosurgery, and Psychiatry

Brown, M. R.
The classification and treatment of headache.
M. Clin. North America, Sept.: 1485-1493.

Brown, M. R.
The incidence and heredity of muscular dystrophy: A study of seventy-one patients admitted to the Massachusetts General Hospital.
New England J. Med. 244:88-90.

Cobb, S.
Review of Neuropsychiatry for 1950.
A. M. A. Arch. Int. Med. 87:889-898.

Cobb, S., Shands, H. C., and Miles, H. H. W. (Editors)
A case of asthma treated with Psychotherapy.
Am. J. Med. 11:117-122.

Green, T. H., Jr.
Management of craniocerebral injuries.
U.S. Armed Forces M. J. 2:455-463.

Orthopedic Surgery

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Lyman G. Richards will lecture on "Injuries of the larynx and their treatment" at a Medico Military Symposium to be held at the United States Naval Hospital in Chelsea on October 31. Dr. David G. Cogan will speak on "Effects of radiation on the eye".

Miss Phyllis Scott has been appointed Executive Secretary of the Boston Eye Bank, replacing Miss Olive Crowley. Miss Scott has been associated with the Infirmary for two and a half years, in the Public Relations Department.

Plans for the expansion of the Eye Bank throughout the New England area will continue. Forty-nine hospitals are now affiliated with the Eye Bank—the most recent affiliates being the Portsmouth Hospital, Portsmouth, New Hampshire, and the Harbor Hospital, York, New Hampshire. Last year, 90 eyes were received from the affiliated hospitals (including the Massachusetts General and the Vincent Memorial). These eye donations were used either for the corneal graft operations or for research.

A series of ophthalmological films were shown in the Lucien Howe Library during July, August, and September for the Infirmary House Officers and interested Staff members. Special invitations were sent to Boston hospitals for the showing of an exceptionally fine color and sound film, "Embryology of the eye", produced with the cooperation of the Carnegie Institute. Some 75 people attended.

The film program was a teaching experiment this summer, and it is hoped that more films may be shown during the fall and winter.

Dr. Jens Edmund of the University Eye Clinic, Copenhagen, Denmark, spent six weeks visiting the Infirmary. He was particularly interested in observing the work of the Howe Laboratory of Ophthalmology. A recent paper of Dr. Edmund's—"Photoelectric measurements of the corneal gloss"—has been translated into English.

MGH DISHWASHING

Many people from outside the hospital visit the Dietary Department throughout the year and each one of them is invariably impressed with our dishwashing unit, which operates with a high degree of efficiency under the direction of Kenneth Weyand. Many of the daily patrons of the cafeterias are not aware of this important unit.

There are two dishrooms – one serves the Nurses' and the West Cafeterias, and is open 24 hours a day; one serves the East Cafeteria, and is open on weekdays for the lunch period only. Each dishroom worker has a special job to do. In the west dishroom, for example, one worker gathers paper and silver from the tray as it is passed into the dishroom, another removes the glasses, another scrapes dishes, etc.

All soiled dishes and cups are presoaked at a temperature of 108°F. before being fed into dishmachines. In the West Cafeteria dishmachine the washwater is 160°F., the first rinse 180°F., and the final rinse 200°F. Dishes and silver are air-dried. Trays are partially air-dried, and then are blotted with sponges which are constantly being sent through the machine to be sanitized.

There are 21 dishwashers who work round the clock – 10 work from 6:30 A.M. to 3 P.M., 10 work from 11:45 A.M. to 8:15 P.M., and 1 from 10:30 P.M. to 5:30 A.M.

A member of the Pathology Department spot checks clean dishes once a week to determine bacterial counts. Here is a report of the findings of Dr. Louis Dienes's laboratory, made on July 24, 1951:

Bacterial food utensil count
West Cafeteria
Planted on bacto agar for bacterial count

Plates	1
Silver	0
Cups	0
Glasses	1

Bacterial count should not exceed 100.

On the day this count was taken, the following numbers of patrons were served in the cafeterias:

Nurses' Cafeteria	
Breakfast	534
Lunch	814
Supper	702
Midnight supper and tea	168
Total	2218
West Cafeteria	
Breakfast	163
Lunch	440
Supper	148
Midnight supper and tea	0
Total	751
East Cafeteria	
Breakfast	0
Lunch	554
Supper	0
Midnight supper and tea	0
Total	554
Grand total —	3523

This does not include the 500 or more cups and saucers used that day at coffee time – this being the number used *every* day during coffee time.

Louise Hatch,
Director, Dietary Department and School of Dietetics

New addresses:—

Dr. Frank B. Colloten (*a. D* 1946), 271 Dartmouth St., Boston 16, Mass.
Dr. Ernest S. Crawford (*ES* 1947), Jefferson Hospital, Houston, Tex.
Dr. Arthur B. French (*a. M* 1951), University of Utah School of Medicine, Salt Lake City, Utah.
Lt. John M. Head, MC, USAR (*a.r. S*) USPHS Hospital, 331 Veranda St., Portland, Maine.
Dr. James E. Kreisle (*WM* 1943), 1003 Capital National Bank Bldg., Austin, Tex.
Dr. Glenn W. Lawrence (*dn. s.*), 25 Bay State Road, Boston, Mass.
Lt. John D. Pitts, MC, USAFR (*a.r. S*), 3615th Med. Group, Craig AFB, Selma, Ala.
Capt. Iwao Uyeda, MC, USAFR (*CM* 1951), 6162d Hospital Group, 314th Air Division, Far Eastern Air Force, APO 994, c/o Postmaster, San Francisco, Calif.

Brief bits:—

Dr. Henry K. Beecher, Chief of our Anesthesia Service, testified before the Senate Interstate Crime Committee (Kefauver Committee) at Washington on August 15, at the hearings on narcotics. Dr. Beecher gave testimony on the new synthetic agents.

Dr. Edward D. Churchill, Chief of Surgical Services at M.G.H., was elected Miembro Correspondiente Extranjero de la Academia Argentina de Cirugía on August 8.

Dr. William E. Eaton (*D* 1907) was retired from the Navy on March 1. Until Dr. Eaton establishes a permanent address, he is using the Munsey Trust Co., Washington, D.C. as a forwarding address.

Dr. Lytt I. Gardner (*CM* 1944) has been appointed Associate Professor of Pediatrics at the State University of New York Medical Center, Syracuse, N.Y.

Mr. E. Russell Greenhood, who was appointed the first Comptroller in the history of M.G.H in May 1947, resigned on August 31. Mr. Lawrence E. Martin is now serving as Acting Comptroller.

Mrs. Sarah R. Trask, who has graced the Front Desk in the General for the past ten years, has retired to her farm. Mrs. Adeline E. Morrill has taken her place.

Dr. Arthur L. Watkins, Chief of Physical Medicine, left for Denver on August 31 to preside at the annual meeting of the Congress of Physical Medicine and Rehabilitation which took place from September 4 to 8.

* * *

Dr. Dean A. Clark was the last speaker at the dedication of our new Research Building on May 16. Here is a transcription of his address:

COMPLETING ONE HUNDRED FIFTY YEARS

1961

This ceremony marks the completion of one of the fondest dreams of the Hospital for a long time—a laboratory building worthy of the men and women of our staff who, through the years, have toiled, often in attics, cellars, and cubbyholes, to make many notable contributions to the scientific knowledge of medicine, for the well-being of mankind. It also marks the beginning of new efforts in research, directed especially at those diseases like cancer, heart disease, arthritis, and mental illness, that are as truly the plagues of the human race in our day as was the Black Death in the fourteenth century. This is a splendid achievement of which we may well be proud and a challenge that we are confident our research workers, together with their associates here and in other institutions, will meet with courage, imagination, and plain hard work.

Sometimes people wonder why so much attention these days is given to research in hospitals. Why can't it be done, as it frequently used to be, in special scientific laboratories quite separate from a hospital? Of course it can be, and very successfully, in many fields. But the challenge of these diseases illustrates most pointedly that the "proper study of mankind is man." For only in man can most of these chronic afflictions be found, and so we must turn to man to learn about them. Clinical observation, valuable as it is, cannot alone get to the root of these problems. Hence we must have, associated with our clinicians, those engaged in the basic sciences of chemistry, physics, and biology, and it is to bring these scientists into the closest possible connection with the health problems of people that this splendid building has been erected not fifty feet from where our patients are being treated. Indeed, one of the wards in the Bulfinch Building, made possible by the benefactions of a person sitting on this platform, is devoted exclusively to research studies on patients who have volunteered for this purpose. Thus, the findings of these new laboratories can immediately be applied in human subjects, under optimal conditions for their protection and observation. From the successes in our research ward benefits can be released for the aid of all sufferers throughout the world. Such association of scientists and clinicians also calls for an intimate relationship with other institutions whose concern with science is a primary one. Hence, we are most grateful for the cordial associations with Harvard University and the Massachusetts Institute of Technology, about which you have already heard today.

For, as I need hardly remind you, a hospital's primary function is not research, but care of the sick. So that we may be able in the future to continue to render the high standard of care of which we are rightfully proud, we must also have teaching; and to improve the effectiveness of our care and our teaching, we must have research. The three are inseparable in a hospital of this kind.

In 1961—ten years from now—the Massachusetts General Hospital will have attained the respectable age of 150 years. By then we hope to see many new developments here in the care of patients, in teaching, and in research. We have been working hard, together with Harvard and M.I.T., to plan these developments, and to estimate the staff, the buildings, and the endowment required to bring them into being.

For the care of patients, the Hospital finds itself less fortunate in some respects today than it was ten years ago. During this time our endowment income for patient care has increased but a very little, while the cost of that care has more than doubled, exclusive of costs for teaching and research. As a result, the Hospital today can afford to furnish only about one-half as many patient days of charitable service as it could ten years ago. To restore our ability to serve the community adequately, we shall need additional endowment funds for patient care of at least $6,600,000.

The full-time staff required for patient care, teaching, and research must be increased if we are to carry our full share of these activities. Over the next ten years we are hoping, in collaboration with the Medical School, to increase our full-time permanent staff by nine associate professors and professors. This may sound, at first, like an unwarranted expansion in these times. Its importance to the Hospital, however. is in the intensification of our work this new staff will make possible, by bringing on to a permanent, full-time basis staff who must now be engaged for brief periods only, or who must now try to carry on their scientific work and teaching amid the arduous demands of clinical practice. The endowment needed by the Hospital and Medical School together, to support the work of these men and to bring to an adequate level the support of those already with us, will be $7,500,000.

Our research work at present is entirely supported by outside funds, mostly temporary in character. If we are to attract the kind of scientists who will make research their career and thus give promise of worth-while accomplishments, at least a core of endowment is needed which, when supplemented by temporary funds, will enable us to continue and improve the quality of our work. Again, we do not intend or desire to expand our research activities, but merely to intensify them and improve their quality. But to make even this possible, research endowment funds of $2,500,000 must be found.

Capital endowment brings central strength to an institution and, because of this, our primary aim in the next decade will be to meet the needs for endowment I have just outlined. But there must also be structures in which the work can be carried out. Once again we do not want to expand but to improve quality. We do not believe that this Hospital should have any additional beds except perhaps in psychiatry. But to care for the sick, to do our teaching and research, we must have housing for our nurses and house officers, decent laboratories for supporting services, such as pathology, and such mundane things as space for parking, for the laundry, maintenance shops, storage, and renovation and relocation of operating rooms. The X-ray department is largely housed in quarters which, though just passable now, are extremely inconvenient and inefficient and, over the next ten years, will become wholly obsolete.

There are other building needs, all for replacement, renovation, or improvement of quality, but today I shall stress only those we believe to be of immediate urgency. The first of these is the nurses' home and training school. As you know, we are currently engaged in a campaign to raise building funds for this. Demands for nurses far exceeds the supply today. Only by enlarging our school of nursing and by providing decent quarters for staff nurses can we hope to meet our requirements for nurses and assume our fair share of meeting the nation's needs. It is utterly impossible to accomplish this with our present quarters, and we hope, therefore, by next year to see built as a structure at the lower end of this yard, balancing this Research Building, a fine addition to our nurses' home to house 145 nursing students and staff nurses.

The other building in our present campaign is for Pathology, the discipline that largely determines the quality of medical care provided in any hospital. It is the Pathologist who, by examining tissue under the microscope, or by making chemical, biological, or bacteriological tests, confirms the clinician's impression of his patient's condition, or gives him information that enables him to seek new explanations for it. Our Pathology Department which now serves a hospital with nearly 1,000 beds and 15,000 admissions a year, not to mention 200,000 out-patient visits, is housed in a building constructed for it in 1896, when the Hospital had 250 beds, 4,304 admissions, and 91,468 out-patient visits annually. Obviously, first-class work can be done under such conditions only through the most devoted and self-sacrificing efforts of the staff and its technical associates and we cannot permit this unfair situation to continue any longer.

Close upon the heels of these two structures must come a building for the medical care of ambulatory patients. This we visualize as a true medical center for the community. At present, patients from all walks of life may, for bed care, benefit from the research and education carried on at Massachusetts General Hospital, whether they are private, semi-private, or general hospital patients, but out-patients may obtain these benefits only if they are financially needy. This seems an unfair discrimination against those in more comfortable circumstances. Our staff believes that the services of our highly trained personnel and complex equipment should be utilized as fully as possible by the whole community. The new ambulatory service, therefore, is planned to be available to all, rich or poor. A trend toward this type of ambulatory service, grouped about a hospital, is now well established in this country and our staff believes that to maintain a place of leadership in medicine today, the M.G.H. must offer such a service to the public and that this will be of great value to patients and doctors alike.

These buildings, and the others I have suggested, must be constructed through public subscription, plus such bequests and governmental assistance as we can obtain. We are proud of the fact that nearly 10,000 individuals made contributions, large or small, to the Research Building fund, and we are deeply grateful to each person who made a contribution. We hope and believe that this wide-spread interest symbolizes the affection and confidence of the entire community.

Financial support and buildings are necessary for any human undertaking, but they are the skeleton alone. What really matters, of course, is what is done with these funds and in these buildings. Our research program is exemplified by contributions like those presented this morning at the scientific session. Teaching has been touched upon this afternoon by two distinguished educators closely associated with the Hospital. Plans are also being made for improved care of the patient, enlarged service to the community. In mentioning our proposed new building for ambulatory patients, I touched upon the plan to develop medical group practice in close association with the Hospital. Another new field of development today is the rehabilitation of the handicapped so that they may be, as far as possible, restored to active and useful lives. Already the Bay State Medical Rehabilitation Clinic is renovating quarters made available to it by our Board of Trustees, and we are looking forward enthusiastically to collaborating with the Bay State Clinic in its important work. This Rehabilitation Clinic, which is to be conducted as a community service by the Bay State group, will be open, from the start, to patients referred from all hospitals, doctors, industries, and social agencies in the area, whatever their age or economic status.

Finally, we are planning, in cooperation with the Medical School, a family health service or "home care" program for the people of the area immediately surrounding the Hospital. As you know, patients from our general hospital now cease to be our responsibility when they are not in our beds or out-patient department. But there is much to be gained today through preventive medicine, and thorough treatment early in illness that cannot be obtained without a complete health service for the family. By including these services, better supervision of treatment is made possible, many admissions to the Hospital will become unnecessary, and patients can go home much earlier, thus saving many days of hospitalization. A movement for such home care programs is also well established among hospitals in Boston and elsewhere and we believe it to be an essential function in any general hospital that seeks to be of maximum usefulness.

With such a comprehensive program of home care, ambulatory service, and rehabilitation, in addition to our more traditional bed and out-patient care, the benefits of the research to be carried out in this new building, and of the educational activities here, can be extended to a much broader section of the people than they now can. By this means, we believe that health can be better protected, illness, disability, and unnecessary death prevented, for the benefit of us all. The initiation of these activities will, it is true, be expensive. But we are certain that, in the long run, the medical resources represented by a hospital like this one can thus be utilized most economically and that immeasurable savings to the community—to you—in direct medical and hospital costs, in loss of time from productive employment, and in the costs of invalidism and dependency, will result.

Our ten-year program may seem an ambitious one. We do not think so. We think of it as an evitable step in the evolution of the Hospital from a four-walled haven for the desperately sick poor, to a center from which preventive and curative health service may be extended to all. We hope that all of you will be eager to join us in the endeavor.

⁂

The Massachusetts General Hospital family again this summer welcomed the students in the Summer School of Clinical Pastoral Training, a course which is sponsored by the Institute of Pastoral Care. This year there were nineteen clergymen and theological students in each of the two six-weeks' sessions which were conducted consecutively. The thirty-eight persons in the School represented widely varying backgrounds in their ages, origins, education, and previous experiences. The youngest was twenty-one, the oldest was fifty-three. They came to the M.G.H. from fourteen States, scattered as far apart as Florida, Michigan, Iowa, and Connecticut. Others were from four provinces of Canada, and one from Thailand.

Each member of the group had one academic degree, and several had two or three. Three had been elected to Phi Beta Kappa, and four others admitted to having received university degrees with special honors. They had received their advanced education in forty-eight different colleges and universities which were as varied as Harvard, Yale, and M.I.T. on the one hand, and the Hebrew University in Jerusalem, Bangkok Christian College in Siam, and the University of Alberta on the other.

Fourteen of the thirty-eight were veterans of World War II. At least four of these veterans were influenced toward their religious vocation by certain war experiences or through meeting particular persons during their military service. Twenty-one were married, seventeen were single. Two were women training for full-time work in religious education. Fourteen different religious faiths and denominations were represented: Baptist, Church of England in Canada, Church of the New Jerusalem (Swedenborgian), Congregational, Episcopal, Evangelical United Brethren, Jewish, Lutheran, Methodist, Moravian, Presbyterian, Unitarian, United Church of Canada, and Universalist.

Many lay people feel that all clergy ought to have some practical experience at making a living in ways similar to those of other people. The members of the Summer School had worked for periods ranging from a few months to as much as ten years as the following: investment banker, skilled machinist, foreign correspondent, worker in a meat-packing plant, factory worker, college teacher, public health instructor, radio tester, staff worker at M.I.T. acoustics laboratory, employee of the U.S. Department of Agriculture, theatre usher, high school English teacher, Y.M.C.A. secretary, instructor in radar, furniture salesman, sawmill laborer, advertising agent, police reporter, editorial writer, machinist's helper, newspaper worker, and pre-law student. Three had been pre-medical students. In addition, several of the veterans had been Army or Navy pilots. One had flown the "hump" from India to China. One had been a public relations writer for the Navy, another a Naval historian, another a personnel technician and classification specialist, and another a production control and procurement officer. One veteran had served as aide-de-camp to certain highly placed Army generals. It was impossible to find out from these veterans how many of them had been awarded the Purple Heart and other military decorations, but we know that this information would have made an impressive list.

The members of the Summer School put in full time at the M.G.H. during their period of training. For the first two weeks of each session they worked three hours daily as volunteer orderlies. This work seems to be the most efficient and effective way to get the students acquainted with the total task of caring for the sick. For the remaining four weeks they served as assistant chaplains and called on patients, under the close supervision of Chaplain James H. Burns and his Summer School staff. Two meetings were held each day. During the summer eighteen members of the Massachusetts General and Eye and Ear staffs lectured to the students. Representatives of the Nursing Service, Social Service, and Admitting Office also met with and talked to the groups.

A young clergyman from Nashville voluntarily wrote us at the end of his course, "I feel that the six weeks at the Massachusetts General Hospital was one of the most profitable experiences I have ever had, and I intend to be a strong booster for the course there."

Rev. James H. Burns,
Protestant Chaplain to the
Massachusetts General Hospital

BIOGLETS

Dr. Ransom J. Arthur, Intern on the Children's Medical Service – born in New York, N. Y., December 5, 1923; 1st Lieutenant, U. S. Marine Corps, 1943-46: Intelligence Officer with 22d Marine Regiment, serving in the Marianas and the Okinawa campaign; A.B., University of California, 1947; M.D., Harvard Medical School, 1951; home: San Francisco, California.

Dr. Anthony A. Arzimanoglou, extra Assistant Resident in Orthopedic Surgery – born in Athens, Greece, November 23, 1919; Athens American College, Athens, 1930-38; M.D., Athens University School of Medicine, 1945; General Surgery, Athens Laicon Hospital, 1946; Assistant Resident and Chief Resident in Orthopedic Surgery, Orthopedic Clinic, Athens University Evangelismos Hospital, 1947-50; military service: in charge of Amputee Center for amputations and prostheses, Ministry of War, Athens, 1948-50; came to U. S., July 1950, with appointment as Research Fellow in Orthopedic Surgery, Boston University Medical School, under the Fulbright Smith-Mundt exchange of persons program; Fellow in the Fracture Clinic, Boston City Hospital, July 15, 1950 – December 31, 1950; Chief Resident, Orthopedic Clinic, Massachusetts Memorial Hospitals, January 1 – June 30, 1951; home address: Patisia Avenue 197, Athens, Greece.

Dr. Henry H. Banks, Assistant Resident in Orthopedics – born in Boston, Massachusetts, March 9, 1921; A.B., Harvard College, 1943; M.D., Tufts Medical School, 1945; Intern, General Surgery, Beth Israel Hospital, Boston, 1945-46; U. S. Army: April 1946 – October 1947; Assistant Resident in Surgery, Beth Israel Hospital, October 1947 – July 1949; Assistant Resident in Orthopedics, Children's Hospital, Boston, July 1949 – April 1950; married; one daughter.

Dr. Crawford S. Brown, Assistant Resident in Dermatology – born in Minneapolis, Minnesota, April 30, 1923; B.A., Kenyon College, Gambier, Ohio, 1946; M.D., University of Michigan, 1948; Intern, Germantown Hospital, Philadelphia, 1949; U. S. Navy: Lieutenant (j.g.), Naval Medical Research Institute, Bethesda, Maryland, investigating biological changes in irradiated animals, 1949-50; private practice of Dermatology, as associate to the Assistant Professor of Dermatology, Georgetown University, Washington, D. C., 1950-51; home: Washington, D. C.

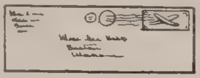
Dr. Albert Damon, Intern in Medicine – born in Boston, Massachusetts; A.B., Harvard College, 1938; certificate in Anthropology, Oxford, England, 1939; graduate student, Harvard and University of Chicago, 1939-42; U. S. Army Air Force, 1942-46: Aero Medical Laboratory, Wright Field, Ohio, and service in England and France in 1944; Ph.D., University of Chicago, 1946; M.D., Harvard Medical School, 1951; home: Newton, Massachusetts.

Dr. Fa-Chi Dunn, Assistant Resident in Dermatology – born in Canton, China, April 18, 1920; M.D., Hsiang-ya Medical College, 1944; Intern in Pathology, Yale University Medical College, New Haven, Connecticut, 1948; Assistant Resident in Pathology, Temple University Medical College, Philadelphia, 1949; Assistant Resident in Medicine, McCook Memorial Hospital, Hartford, Connecticut, 1950.

Dr. Harry Chao-Hung Fang, Assistant Resident in Psychiatry – born in Soochow, Kiangsu, China, March 10, 1924; B.S., St. John's University, Shanghai, 1942; West China Union University College of Medicine, Chengtu, Szechwann, China, 1943; Army, China: Liaison Officer, Ex-Major, September 1943 – March 1945; M.D., St. John's University College of Medicine, 1948; Surgical Intern, Lester Chinese Hospital, Shanghai, July 1948; Rotating Intern, Bishop DeGoesbriand Hospital, Burlington, Vermont, October 1948 – July 1949; Resident in Neuropathology, Mallory Institute of Pathology, Boston City Hospital, Boston, Massachusetts, July 1949 – July 1950; Assistant Resident in Neurology, Neurological Unit, Boston City Hospital, July 1950 – June 1951; home: Shanghai, China.

Dr. James B. Field, Intern in Medicine – born in Fort Wayne, Indiana, May 28, 1926; Harvard College; U. S. Army: 3d Infantry Division in France and Germany, 1944-45; wounded in action; M.D., Harvard Medical School, 1951.

Dr. John C. Rowe, Intern in Medicine – born in Dunkirk, N. Y., July 27, 1927; A.B., Colgate University, 1947; M.D., Harvard Medical School, 1951; home: Dunkirk, N. Y.



This brief note has come from Lt. Weldon W. West, MC, USAR (*S* 1948):

> At present I am doing surgery at the U. S. Army Hospital at Fort Hood, Texas. Since leaving the medical orientation course at Fort Sam Houston, I have not been associated with any of the men from M.G.H.
>
> Mrs. West sends her greetings to the Distaff Club.

Lt. Col. Frank A. Mantz, Jr., MC, USAR (*res. fel. P* 1950) sends us word of his present assignment.

> This will inform you that I have had a change of station and will depart soon for my new assignment. I enjoy receiving THE NEWS more than I can say, and request that in the future you send my copies to me at the Army Medical Service Graduate School, Tropical Medical Research Laboratory, San Juan, Puerto Rico.

Dr. Means received this interesting letter from Lt. William N. Christenson, written last June from the Epidemic Disease Control Unit #2, Naval Base, Norfolk 11, Virginia.

> I've been looking for the opportunity to write you a note, for I have fallen into that part of the Navy that makes one long even more strongly than usual for the friendships and teaching of the M.G.H.
>
> At the time you saw me I was enjoying a three-month period in Washington, where I was working at the Bureau of Medicine and Surgery of the Navy. Being in Washington

Dr. William Stone, Jr., M.D., Assistant in Ophthalmology, Massachusetts Eye & Ear Infirmary, whose ingenious technique, applied to the movable artificial eye and the new plastic cornea, is described on page 1.

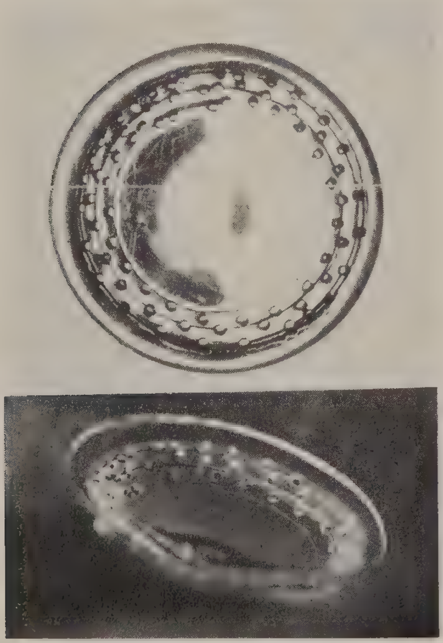


Figure 1. Plastic artificial corneal discs presently in use in these experiments.

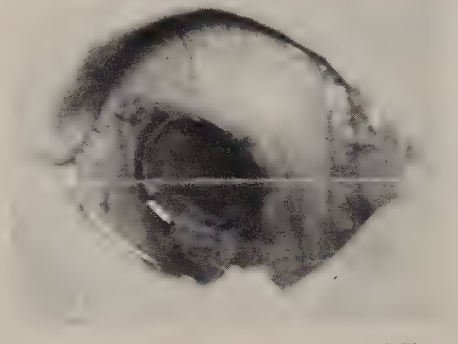

Figure 2. Photograph shows plastic disc of Figure 1 in place in scarred rabbit cornea at end of 12 months. Large central area is clear, exposed plastic.

was pleasant, but the work at the Bureau could hardly be called stimulating. However, as you doubtless know, many former MGH people are in Washington now, including Holly Smith, Don McCann, and Lorry White, with Bill Fritz near by in Baltimore. Needless to say, we had numerous reunions – so many, in fact, that the term "reunion" became improper, for it was very much like our days in Boston.

Before Washington, I had been stationed at Camp Edwards on the Cape, and there life was most pleasant, though not too busy, with work on a medical ward under Gus Kaufmann, who was our Chief of Professional Services. When I left Camp Edwards I was in a state of great delight, as my orders read for me to report at the Naval Medical School at Bethesda and I naturally thought this was going to be a chance to work there on something interesting. Unfortunately for me, this bliss ended rather abruptly when I learned that the orders had left out the important fact that I was being sent to Bethesda to attend the photofluorographic school. I had to inquire in order to find out what in the world this long term stood for, and learned this too late. Since then the answer has been unfolding, for it means the reading of miniature chest X-rays. The three months in Washington, spent at the Bureau and not at the Hospital in Bethesda, consisted of reviewing thousands of such films in preparation for reading them in the field. The Navy considers this a "course" of instruction, but at least they were correct in admitting (which they actually did) that the real reason behind the course was to explain the paper work. The reading of the films was only incidental.

When I first learned of my orders to Bethesda I hoped that I would be able to work on an artificial kidney for the Navy. And, in view of the nature of the work I found waiting for me, it is not surprising, I trust, that I did all I could to promote my transfer to the Naval Hospital for such an assignment. I got so far as to help convince the Navy that it should develop an artificial kidney, since the Army has one, but when I was ordered out to my present job the kidney had not materialized. Happily, I left with word of the possibility of my being recalled to work with the kidney, if it is obtained. Needless to say, I'm hoping most strongly.

At present I am located on the Naval Base in Norfolk, where I am in charge of the mobile photofluorographic unit for the Fifth Naval District. The work consists mostly of administration, since it is my responsibility to schedule the unit's work amongst the various ships and shore establishments in this area, and I have to sign all the items in the voluminous correspondence entailed. I read all of the little X-rays, which come out on 35 mm. film and which amount to about 300 to 400 a day in number. Any suspicious lesion on a small film calls for a standard 14 x 17 film, which we are equipped to take and which I read also. Any sustained positive findings call for hospitalization of the patient for study. In this fashion the system works pretty well, as the Navy requires such a miniature X-ray yearly on all of its men and civilian employees. My unit is mounted in a bus and we can travel all over this Naval District, though so far most of our work has been confined to the rather extensive Naval lay-out here in the Norfolk area.

I miss very much the personal contact with patients. Actually, unless I hunt up my suspected candidates on their ships, which I do, I'm not supposed to see any patients. The job offers an excellent experience in the surveying of the normal chest. I suppose I've seen some 10,000 of them since coming here! There is a Naval Hospital near, in Portsmouth, but this is a geographically difficult spot to reach from the Naval Base, as in this city one has only ferries, not bridges, on which to cross the rivers, and the traffic reminds one of downtown Boston on a busy day. There is a lot of time for reading, obviously, and this is some retribution for the lack of clinical work. But the whole thing makes me look back upon the productive days at the M.G.H. with ever-increasing longing.

Several weeks ago I received quite a shock, while reading the MGH News, when I came upon your epitaph to Dr. Beckman, for I had not heard previously about his death, although I did hear last year of his severe illness. During my brief contact with Dr. Beckman I grew to like him very much, and like many others I had occasion to be grateful to him for advice and help. I always felt a little disappointed that he left the M.G.H. at about the same time I returned as an intern.

Please remember me to the people at the M.G.H. Perhaps it is a little strange that I should ask you to do this at a time when I know you are leaving the Hospital. But I cannot believe that you ever actually will leave the M.G.H., for to me much of the fineness of the Hospital appeared to stem from your direction of the Medical Service. I hope it will not seem impertinent of me to have said this, and I want only to add that I know it will always remain my greatest honor and privilege to have worked on your service.

THE 1811 NEWS

No. 106 Boston, Mass. November 1951

ENDOSCOPY

Fifteen years ago, when the Endoscopy Service was started, the endoscopist used to go around the wards inquiring if there were any cases available for endoscopic procedures. Often there seemed to be none, or if there were the answer was, "We don't want to put the patients through it." On one occasion when he wanted to demonstrate gastroscopy to a distinguished visitor from England the endoscopist was told there were no suitable cases, and a complaint was made to the Medical Chief that he was a nuisance! The attitude of the visiting staff and the house staff seems to have changed considerably, for now they say, "Let's slip in a bronchoscope", and sometimes a consultation reads like an order —as, for example, "Bronchoscope tomorrow"! (Bronchoscope, by the way, is a noun and not a verb.)

"The word endoscope comes from [two Greek words meaning, respectively,] 'within' and 'to examine', and means an instrument for the examination of the interior of a hollow viscus.

"Bozzini in 1806 was the first physician to show an interest in the inspection of body cavities by artificial lights. . . . Kussmaul in 1868 was the first to attempt gastroscopy. . . . His first experiments were carried out on a professional sword swallower, but unfortunately the source of light was insufficient to give any practical results."[1] A new era for endoscopy began in 1879 with the invention of the carbon incandescent electric lamp. Since then electrical, mechanical, and optical improvements have been rapid, and each has contributed to modern endoscopy.

Regarding modern endoscopy Dr. Edward D. Churchill recently wrote, "Someone has said that endoscopy is merely the art of looking through a tube. Could anyone be so rash as to say this of the great science of astronomy? Of course, the technics of both astronomy and endoscopy can be brought to the carnival level where one may drop a quarter in the slot and look at the moon, or for the same price watch a sword swallower pass a strip of metal down his esophagus." So the answer as to how endoscopy should be molded "into a productive and significant area of medicine is simple: the subject matter of the area [should be] first and foremost the patient and not merely the technical skill of taking a look at his insides."[2]

The endoscopist actually does come in contact with a great many diseases, and since he takes an interest in the patient as a whole his interests are widespread. The following summary illustrates the common and also the rare pathology which may come to his attention.

BRONCHOSCOPY

The bronchoscopist should keep up his interest in general pulmonary disease by attending thoracic rounds and pulmonary clinics, where he will see chest X-rays and hear general discussions of the patients from the point of view of the internist, the thoracic surgeon, and the radiologist. In bronchoscopy he may see acute laryngotracheobronchitis, chronic bronchitis, bronchiectasis, lung abscess, postoperative atelectasis, congenital cardiovascular anomalies, tracheobronchial tuberculosis, tracheobronchial syphilis, tracheobronchial diphtheria, mycotic infections, foreign bodies, benign tumors, carcinoma, sarcoma, lymphoma, metastatic malignant disease of the bronchus, tumors of the trachea, asthma, sarcoid, bronchial trauma, and fibrocystic disease of the pancreas with bronchitis and bronchial obstruction.

ESOPHAGOSCOPY

Diseases of the esophagus are of interest to the gastroenterologist as well as to the thoracic surgeon. Therefore, in addition to attending thoracic meetings, the esophagoscopist should attend gastrointestinal conferences and be familiar with the medical, surgical, and radiological discussions of diseases of the esophagus. In performing esophagoscopy he frequently sees esophagitis, hiatus hernia, esophageal ulcer, benign stenosis, lye stricture, esophageal web, achalasia, diverticulum, varices, benign tumors, carcinoma, sarcoma, lymphoma, metastatic tumor, foreign bodies, and extrinsic pressure (from tumors, tuberculous glands, aneurysm, congenital vascular ring, and cardiac hypertrophy). Less often he may see trauma, external injury, bronchoesophageal and tracheoesophageal fistula, tuberculosis, syphilis, diphtheria, actinomycosis, blastomycosis, pellagra, scleroderma, mucous membrane pemphigus, myasthenia gravis, paralytic dysphagia, and emotional disorders of swallowing.

GASTROSCOPY

All diseases of the stomach are of interest to the gastroscopist and should be studied clinically on the wards and at gastrointestinal rounds in association with internists, surgeons, and radiologists. Gastric diseases include superficial gastritis, hypertrophic gastritis, gastric atrophy, gastric ulcer, gastrojejunal ulcer, benign tumor, carcinoma, sarcoma, lymphoma, tuberculosis, syphilis, actinomycosis, moniliasis, diverticulum, foreign body, bezoar, gastric allergy, extrinsic tumors pressing on or invading the stomach, and functional dyspepsia.

PERITONEOSCOPY

By way of the peritoneoscope, the endoscopist comes in contact with carcinoma (especially as it invades the liver and peritoneum), sarcoma, lymphoma, cirrhosis of the liver, hepatitis, tuberculous peritonitis, and ectopic pregnancy. Unexplained ascites brings up many interesting problems and is often an indication for peritoneoscopy.

Interest in learning endoscopy is attested by the recent report of the Surgical Residency Survey Committee in which, as a result of a questionnaire, it was recommended that "more experience in thoracic surgery and endoscopy be arranged by better organization of our own clinical resources. . . ." Such a reorganization seems to be indefinitely postponed, due to the war in Korea with its consequent demands on our resident staff. At the present time the Endoscopy Service is continuing to train residents from the Ear, Nose and Throat Service, and from the Anesthesia Service. World-wide interest in endoscopy is proved by our Harvard Medical School graduate students, who have been geographically distributed as follows: United States (36), South America (6), Canada (3), China (3), Mexico (2), Portugal (2), Philippines (2), Cuba, India, Guatemala, Lebanon, Turkey, and South Africa, one each.

Since the first report on the flexible operating gastroscope in 1948[3] we have taken 240 biopsies, with no accidents and no complications. The greatest field of usefulness for gastroscopic biopsy lies in the differential diagnosis of gastritis, lymphoma, and diffuse carcinoma. Other authors have reported similar results. Over 200 flexible operating gastroscopes are now in use.

Dr. Lowrey F. Davenport, associated for many years in bronchoscopy, has resigned as Assistant Physician at the Massachusetts General Hospital and has moved to Atlanta, Georgia. Dr. J. Gordon Scannell, Assistant in Surgery, and Dr. Lamar Soutter, Assistant Surgeon, have been helping in bronchoscopy and esophagoscopy. Dr. Gustavo R. Serrano of Mexico City, here as a Clinical Fellow in Surgery since January first, became so proficient in all the endoscopies that he was a real addition to the Endoscopy Clinic. Unfortunately, he left at the end of October to return to Mexico.

Edward B. Benedict, M.D.,
Endoscopist

VOLUNTEERS WANTED—DOCTORS' WIVES

Please leave a message for Mrs. Walter Bauer in the Volunteer Office (La3-8200, Extension 257) if you can contribute any time to MGH activities.

The Board of Trustees, at their meetings on September 7 and 21, and on October 5, voted:

To accept with regret the resignation of Dr. Brown M. Dobyns, Assistant in Surgery;
To accept the resignation of Dr. Arthur B. French, Assistant in Medicine;
To accept the resignation of Dr. Patricia Wanning from the position of Assistant to the Children's Medical Service;
To grant leave of absence to Dr. Churchill from September 11 to November 12, and to make Dr. Leland S. McKittrick Acting Chief of the Surgical Service for that period;
To grant leave of absence to Dr. Richard Chute from September 15 to the end of his present appointment, allowing him to retain full privileges at Baker Memorial and Phillips House;
To grant leave of absence to Dr. Charles E. Rounds for the balance of his present appointment.

To appoint:

Dr. George R. Burland as First Assistant Resident in Surgery for one year, beginning October 1;
Dr. Ernest M. Daland to the Board of Consultation, effective as of July 1;
Dr LeRoy L. Eldredge, Jr. as Assistant to the Children's Medical Service;
Dr. Richard H. Eppright as Assistant Resident in Orthopedic Surgery for one year, beginning January 1, 1953;
Dr. Robert H. Fennell as Assistant Pathologist, effective January 1, 1952;
Dr. Hans J. Harder as Assistant Resident in Anesthesia for six months, beginning August 6;
Dr. James P. Hepburn as Assistant Resident in Anesthesia for one year, beginning September 1;
Dr. Owen W. Kite as Assistant Dental Surgeon;
Dr. James H. Means to the Board of Consultation;
Mr. Lovick C. Miller, Jr. as Assistant Psychologist, beginning September 1;
Dr. William J. Shriber as Assistant in Medicine and Assistant in Physical Medicine, effective as of September 1;
Dr. Paul A. Srere as Assistant in Biochemical Research, effective as of September 1;
Miss Mildred E. Swinson as Assistant Psychologist, beginning September 1.

At their meetings held during September, the General Executive Committee voted:

To promote Dr. Falls B. Hershey to the position of Resident Surgeon, effective January 1, 1952;
To promote Dr. Robert S. Shaw to the position of Resident Surgeon, effective January 1, 1952;
To continue the appointment of Dr. Frederic M. Blodgett as Clinical and Research Fellow on the Children's Medical Service for the year July 1, 1951 through June 30, 1952;
That Dr. Morten Smith-Petersen's appointment as Orthopedic Resident become effective October 1, 1951 rather than January 1, 1952.

To appoint:

Dr. Mustafa I. Adham as Graduate Student Assistant in Surgery for one year, beginning September 17;
Dr. Simon Black as Research Fellow in Biochemistry, beginning September 1;
Dr. Aulio R. Brea, as Clinical Fellow in Surgery, assigned to Endoscopy, beginning October 1;
Dr. Daniel R. Clement as Clinical and Research Fellow in the Children's Medical Department for one year, beginning September 4;
Dr. Jeannine Crepeaux as Clinical and Research Fellow in the Children's Medical Department for one year, beginning September 4;
Dr. William H. Elliott as Research Fellow in Biochemistry, effective as of September 1;
Dr. Joseph W. Gardella as Clinical and Research Fellow in Medicine, effective as of September 1;
Dr. Edgar L. Gasteiger, Jr. as Research Fellow in Neurosurgery, effective as of July 1;
Dr. Mary E. Jones as Research Fellow in Biochemistry, beginning September 1;
Dr. Leon Levintow as Research Fellow in Biochemistry, beginning September 1;
Dr. Winifred Liu as Research Fellow in Surgery, assigned to Gynecology, effective August 1;
Dr. Herbert B. Locksley as Clinical and Research Fellow in Neurosurgery for one year, beginning August 1;
Dr. Robert F. Martin as Graduate Student Assistant in Surgery for nine months, beginning July 23;
Dr. Charles V. Menendez as Clinical and Research Fellow in Surgery, effective as of July 1;
Dr. Paul H. Painter as Clinical Fellow in Psychiatry, beginning October 1;
Dr. Pierre Passouant as Research Fellow in Neurology, assigned to the Electroencephalographic Laboratory, as of September 1;
Dr. Manuel Quijano as Clinical and Research Fellow in Surgery for nine months, beginning October 1;
Dr. Prospero T. A. Santos as Clinical Fellow in Surgery, assigned to Endoscopy, effective as of October 1;
Dr. Raymond C. Vilain as Clinical and Research Fellow in Surgery for nine months, beginning October 1;
Mr. Lawrence L. Whytehead as Clinical and Research Fellow in Surgery, beginning October 1.

NEUROPHYSIOLOGY AT M.G.H.

The role of the nervous system in the body is that of an intercommunicating network linking its various parts, informing one part of what another is doing, and thus contributing to the resultant performance of the whole. It would appear that the science of the nervous system—neurophysiology—is beginning to play a somewhat similar role in our hospital, for basic research in this field finds its place in many departments: in Neurology, Anesthesia, Psychiatry, Neurosurgery, and Physical Medicine (to mention only its principal mentors). All of these medical sciences seek the answer to the questions: how does the brain work? how does the spinal cord work? and the peripheral nervous system?

In laboratories in the White Building, the Bulfinch, and the Domestic Building, workers are to be found engrossed in these problems at levels varying from the most basic to the most directly applied forms of neurophysiology.

To describe all the lines of attack that are currently being pursued would be impossible in this space, and only those with which the writer is closely in touch will be described here.

Among the laboratories built last year in Dr. Beecher's new wing for Anesthesia is a well-equipped electrophysiological laboratory designed from the outset for experimentation involving the recording by amplification systems, cathode ray oscilloscopes, and camera, of the minute but all-important electrical potentials which signal the presence of activity in the nervous system.

Here in this laboratory some of the fundamental properties of the nerve tracts of the central nervous system are being studied and contrasted with those of the peripheral nerve. This work is wholly new and has been made feasible by the discovery of a technique for dissecting out the white tracts of the live mammalian spinal cord and for keeping them "alive" and functioning in a nerve-chamber similar to that used in peripheral nerve studies. The first preliminary description of this technique has been published recently[1]. Dr. Donald O. Rudin, who holds a research appointment in Dr. Beecher's department, has been helped in this work by George Eisenman, from the third year of the Harvard Medical School, and we have been glad to welcome lately the assistance of Mme. Thérèse Passouant, a physiologist from France.

This research is already yielding information which will lead to new concepts of the mechanisms of central nervous system function and the understanding of some of the apparently anomalous results found by older techniques.

Ever since Du Bois-Reymond demonstrated, over a hundred years ago, that a state of activity in nerve is always accompanied by an electrical change, the science of neurophysiology has developed more and more along electrophysiological lines. Whereas the microscope reveals the inert structure of the nervous system, electrophysiology gives us information about its living function; it reveals the codes by which messages are carried along nerves and the routes these messages follow. It is not surprising, then, that the modern neurophysiologist is concerned not only with anatomy, physiology, and biochemistry, but also with electronics.

It is through the role played by electronics (and by the catalytic action of Professor Norbert Wiener, who has always been a good friend to our laboratory) that neurophysiology in this hospital has been able to establish a very fruitful liaison with the Massachusetts Institute of Technology where Professor Jerome Wiesner, Director of the Research Laboratory of Electronics in the Department of Communication Engineering, has been good enough to give research facilities to the writer and to Mr. James Casby of the Electroencephalographic Laboratory.

There are many features of nervous communication which parallel closely those of communication engineering. This fact has received a great deal of publicity lately, due to the general interest in the new calculating machines and so-called "giant brains". Some of this may have been overpopularized, but there is no doubt that the neurophysiologist often finds himself faced with almost the same problems as is the engineer. One such problem is the subject of our current research. We want to know whether the brain-waves recordable from the two sides of the head, under certain conditions, are different or identical in respect to voltage fluctuation with time. (All electroencephalograms are time-series or graphs of voltage changes along a time course.) This is the same kind of problem which frequently faces a communication engineer, for he, too, is interested in studying voltage change with time.

At M. I. T. they have built an instrument, called a digital electronic correlator, which makes such comparisons of time-series automatically. Five-minute samples of two such graphs can be taken by the correlator and, after being transformed into frequency-modulated pulses, can be sampled by the machine 12,000 times at each of 80 time steps—a total of just under a million calculations. The result is reached in a matter of minutes, whereas to handle the mathematical calculations ourselves would probably take us our two lifetimes.

One of the problems to which we have applied this electronic correlator is that of the special type of brain-waves produced by a person when he is engrossed in some mental work, such as arithmetic. We have been able to establish that the waves produced in these circumstances have features almost unique among electroencephalographic patterns and that they differ profoundly from the waves produced by many other types of brain activity (e.g., seeing, listening, sleeping, or in the diseased brain: convulsions, coma, etc.). The exact characteristics found (identical voltage changes in both hemispheres, except that they are of opposite electrical sign) give the neurophysiologist a lead as to the possible brain mechanisms called into play by such a task as mental calculation. A report of this work was given recently at the meeting of the Eastern Association of Electroencephalographers in Canada[2].

Another application of this method is being made by Mr. Casby. This is a study of changes in brain-waves produced by visual stimulation.

In the Electroencephalographic Laboratory, under the direction of Dr. Robert S. Schwab, we have for some time been interested in the effect on the electroencephalogram of flickering lights of varying intensity shone into the eyes of the subject. Such a stimulus is "coded" by the optic nerves and carried to the brain. From animal experimentation sufficient knowledge has been gained to enable us to interpret in some measure the effects we find in the human subject and to elucidate to a certain extent the nervous pathways used and the reactions evoked in a normal person[3].

This work has been closely paralleled on the clinical side by Dr. Schwab's and Dr. John A. Abbott's researches into the reactions of the abnormal subject, and in particular those of the epileptic. The responses of the patients with certain types of epilepsy are strikingly different from the normal, and by comparison with the studies of normals and of animals some clue can be gained as to the mechanism involved in the diseased state. In this work we are fortunate to have visiting us for some months Dr. Pierre Passouant, Research Fellow in the Department of Neurology, who comes to us from the oldest university in Europe—the University of Montpellier in the south of France.

Visiting us also for some months, and also holding an appointment in the Department of Neurology, is Dr. Simon E. Markovich from Santiago, Chile. Dr. Markovich's current studies are of the electrophysiology of muscle, an interest shared by the Department of Physical Medicine and one closely related to Dr. Schwab's researches on Parkinson's disease and myasthenia gravis.

In collaboration with the Departments of Psychiatry and Neurosurgery, we are taking part in a study directed by Dr. Stanley Cobb and Dr. William H. Sweet on the efficacy of orbital gyrectomy as a therapeutic measure in cases of intractable pain. This entails making electroencephalographic recordings before, during, and after the operation. Opportunities to record from this part of an undiseased brain at operation are rare, and correlation of the results with the observations on blood pressure and respiration changes made simultaneously by Dr. William P. Chapman of the Department of Medicine should prove informative. Techniques of this kind are intricate, and without the help of Miss Elizabeth Peterson and Mr. Frank Eckert these recordings would be impractical in their complexity. Other opportunities to record from the exposed brain at operation have been given to us by Dr. James C. White in his operations for temporal lobe epilepsy. Every such opportunity takes us one step nearer to the goal of elucidating the physiological mechanisms of the brain.

Another aspect of human electrophysiology has been followed in the Department of Anesthesia, where Dr. Beecher's project for the Study of Sleep and Sedatives has included observations of the electroencephalogram at various stages of normal and of sedated sleep[4]. A popular description of this work appeared in *Life* magazine. The correlation of electroencephalographic changes with movements made during sleep has also contributed to our understanding of the nervous centers responsible for the change of state.

None of the work outlined here would be possible were it not for generous support from various sources, and it would not be fitting to close without acknowledging our appreciation of grants from the Office of the Surgeon General of the U.S. Army, the Office of Naval Research, the U.S. Department of Public Health, and from Mrs. Henry D. Minot, a very good friend to the Electroencephalographic Laboratory for many years.

Finally, it is good to be able to add that a former neurophysiologist holds the appointment of General Director of this hospital—Dr. Dean A. Clark.

Mary A. B. Brazier, Ph.D.,
Neurophysiologist in the Departments of Psychiatry and Anesthesia

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Psychiatry Department may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and *not* to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Dermatology

Frazier, C. N., Lever, W. F., Leeper, R. W., Keuper, C. S., Bienvenu, L. J., LeDonne, J. E., and Levy, S. W.
Effect of adrenocorticotropic hormone (ACTH) and cortisone on the several varieties of pemphigus.
J. Invest. Dermat. 17:55-60.

Lever, W. F.
ACTH and cortisone in diseases of the skin.
New England J. Med. 245:359-363.

General Medicine

Burrage, W. S.
Medical progress: Antihistamines: Their use and abuse.
New England J. Med. 245:532-537.

Ophthalmology

Leahey, B. D.
Bullous keratitis from vitreous contact.
A. M. A. Arch. Ophth. 46:22-32.

Oto-Laryngology

Miller, D.
Nasopharyngeal cancer.
Laryngoscope 61:187-214.

Radiology

Hanelin, J., and Robbins, L. L.
Medical progress: Radiology in bone pathology.
New England J. Med. 245:20-27; 60-66.

Klein, A., Joplin, R. J., Reidy, J. A., and Hanelin, J.
Roentgenographic features of slipped capital femoral epiphysis.
Am. J. Roentgenol. 66:361-374.

McCort, J. J., and Robbins, L. L.
Roentgen diagnosis of intrathoracic lymph-node metastases in carcinoma of the lung.
Radiology 57:339-360.

Brief bits:—

The address for Dr. William H. Baker (*clin. & res. fel. M*) is still M.G.H. The address for him which appeared in our September issue, given us by what we considered to be an unquestionably reliable source, is incorrect.

Dr. Henry K. Beecher, Chief of our Anesthesia Service, lectured recently at Guy's Hospital, London, and La Salpetriere, Paris, and then went on to Germany at the request of the Surgeon General of the U.S. Army.

Dr. Edwin F. Cave, Visiting Orthopedic Surgeon on our staff, lectured before the New England Surgical Society in York Harbor, Maine, on September 22. His subject was "Femoral shaft fractures treated by medullary nailing".

Dr. Edward D. Churchill, Chief of our Surgical Services, and Mrs. Churchill left on September 11 for a short vacation trip through North Africa and Italy. On October 1 Dr. Churchill went to the University of Birmingham, Birmingham, England, for a month, as Honorary Professor of Surgery. While in England he gave the Simpson-Smith Memorial Lecture at the University of London, Hospital for Sick Children, and a Hunterian Lecture for the Royal College of Surgeons of England.

Dr. E. Grey Dimond (*clin. fel. M* 1949) is Director of the Cardiovascular Laboratory at the University of Kansas Medical Center, Kansas City 3, Kan.

Dr. Sheridan S. Evans (*ES* 1945) is now Assistant Chief of Surgery at the Veterans Administration Hospital in Houston, Texas, and Instructor in Surgery at the Baylor University College of Medicine.

Dr. Leon R. Lezer, one of our Assistant Directors, and his family have moved from the Penthouse, atop the White Building, to the Resident Physician's House. It already looks much happier, now that it is occupied again. It was moved a bit to the south to make room for the new Research Building, and has stayed disconsolately empty since then till now.

Dr. Tracy B. Mallory, until recently Chief of Pathology and Bacteriology at M.G.H. and now Consultant to the Department, was the recipient of the Ward Burdick Award, presented to him by the American Society of Clinical Pathologists on October 17.

Dr. Gertrud C. Reyersbach, Associate Physician to our Children's Medical Service, announces the opening of an office for the practice of Pediatrics at 330 Dartmouth St., Boston.

Dr. Earl B. Sanborn (*a. r. NS* 1943) announces the opening of an office for the practice of Surgery, including Thoracic Surgery, in Illinois. His card bears two addresses—636 Church St., Evanston, and 55 East Washington, Chicago.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Philip E. Meltzer, Surgeon in Charge of the Winthrop Foundation for the Deaf, and Dr. Donald K. Lewis, Associate Surgeon, will speak at the first fall meeting of the New England Otolaryngological Society, to be held in the Ear, Nose, and Throat Clinic on November 14. Dr. Meltzer will report on the work of the Foundation. The subject of Dr. Lewis's talk will be "Ménière's disease—Some observations".

Also on November 14, the New England Ophthalmological Society will meet at the Infirmary, where Dr. Walter H. Fink of Minneapolis, an alumnus of the Eye and Ear, will speak on "The present status of superior oblique surgery".

Observation of the work being carried on here by the Department of Ophthalmology was included in the conference program of the Association of Surgeons of the New York Central System, held in Boston Ocotber 3—5. Dr. Joseph J. LoPresti of the Infirmary staff was host for the visiting surgeons, who toured the Howe Laboratory, the Boston Eye Bank, the Retina Service, and Dr. William Stone, Jr.'s laboratory.

The Infirmary was represented at the fall meetings of the American Academy of Ophthalmology and Otolaryngology and of the American Boards of Ophthalmology and Otolaryngology, which met in Chicago during the second and third weeks in October. Dr. Edwin B. Dunphy, who is Secretary-Treasurer of the American Board of Ophthalmology, took part in the Board examinations and also in the Academy symposium on Medical Education. Among the staff members who participated in the Academy meetings were Dr. W. Morton Grant of the Howe Laboratory, who gave a paper on clinical tonography, and Dr. William Stone, Jr., who spoke at a symposium on the movable implant.

Dr. LeRoy A. Schall, as President of the American Board of Otolaryngology, and Drs. Harris P. Mosher, Philip E. Meltzer, and Werner Mueller assisted with the otolaryngology examinations.

Recent visitors at the Infirmary were a group of Ophthalmologists from Spain and South America. The doctors toured the hospital, spending considerable time in the Howe Laboratory. Dr. David G. Cogan and Dr. David Donaldson discussed briefly the projects of the Laboratory. The visiting doctors were particularly interested in the three-dimensional color slides taken with Dr. Donaldson's stereocamera.

The visiting doctors were Dr. J. Casanovas of Salamanca, Dr. A. Pinero of Cadiz, Dr. Pedro Tena of Madrid, Dr. E. Arques and Dr. J. Arriaga of Seville, Dr. Juan Arentsen of Chile, and Dr. Garcia Aliy of Chile, who is now living in New York City.

BAY STATE
MEDICAL REHABILITATION CLINIC

The Bay State Medical Rehabilitation Clinic, Incorporated, was established on the grounds of the Massachusetts General Hospital last May. Old Ward I was turned over to the Clinic as part of a corporate community project, to establish in New England a medical rehabilitation clinic. The need for such service has been plainly apparent for several years, particularly in view of the growing realization that the physician's responsibility does not end with definitive medical or surgical care, but extends to those long-neglected problems of medical care relating to physical independence for the severely disabled (self-care in dressing, feeding, locomotion, toilet care, and so forth). To provide this type of medical rehabilitation service, the Bay State Medical Rehabilitation Clinic has a professional staff including a medical director and assistants, who are specialists in Physical Medicine and Rehabilitation; physical and occupational therapists, experienced in the techniques of physical analysis and restoration and development of occupational skills; and a rehabilitation specialist, trained in the counselling and coordinating of rehabilitation services. A large board of consultants from the many teaching hospitals of the city provide expert opinion in all special medical fields.

Because of the location of this Center and its easy accessibility to the Massachusetts General Hospital, arrangements were made whereby the Clinic may buy services, such as special diagnostic examination and specialized types of treatment, from the hospital. This eliminates duplication of expensive equipment.

The majority of physicians and surgeons are probably not familiar with this particular field of practice, as undergraduate medical education has been lacking in this aspect of treatment. Only recently, through postgraduate training, has the medical specialty of Physical Medicine and Rehabilitation developed. Specialists in this field, known as physiatrists, concentrate on this portion of medical practice and prescribe specific therapy at the hands of physical therapists and occupational therapists, and other ancillary medical techniques—always keeping in mind the total rehabilitation of the handicapped individual to the fullest physical, mental, social, vocational, and economic usefulness of which he is capable. Physical Medicine and Rehabilitation does not overlap the field of general specialized medicine, but, rather, supplements and complements it.

Although the Clinic is set up as an out-patient center, arrangements have been made with Baker Memorial for those patients needing hospitalization while undergoing treatment at the Clinic.

The Clinic is not set up to service any particular area or patients from any particular hospital. It is open to all handicapped individuals, wherever they may reside. The handicapped person's need and the Clinic's ability to meet that need are the only prerequisites for admission. Patients are admitted to the Clinic for evaluation by the medical staff on referral by private physicians, hospitals, clinics, insurance companies, and social agencies. The patient, on admission, enters an evaluation period, during which the attempt is made to define his capacities and his needs. He undergoes medical examination, his medical history is studied, and he is assigned to the Occupational Therapy and the Physical Therapy Departments for evaluation of his skills and physical capabilities. He is similarly studied from the psycho-social point of view. If he is known to other agencies, they are asked to contribute a report of their experiences.

The length and composition of the evaluation period varies according to the need. During the study all members of the staff confer. Views are exchanged and a tentative rehabilitation diagnosis is agreed upon. On this basis, further activities for the patient at the Clinic are recommended and services from other sources in the community are planned.

A prescription for Occupational Therapy may include one or more of the following techniques: kinetic (to increase motion), energic (to increase strength), metric (to measure or evaluate prevocational potentials, or the activities of daily living), and apotrophic (where physical improvement or well-being depends upon emotional attitude toward illness). It sometimes helps to direct a patient's concentration from the physical abilities that he lacks to an activity or interest which will encourage him to use what he has.

Kinetic and energic Occupational Therapy include coordinated exercise through purposeful activity, very often used by the doctor in combination with or as a step beyond Physical Therapy.

We have set up the Occupational Therapy Department with job demands, in order to do prevocational analysis and training. The aims in this type of analysis are to investigate the physical capacities, intelligence, work habits, attitude toward employment, previous experience, and social relationships of the individual. Since we are not a placement agency, this analysis is sent either to the referring agency or to the agency we feel is best qualified to handle the case.

Prevocational training, as was mentioned above, may precede, be combined with, or follow the analysis, for it utilizes such techniques as are required for teaching an upper extremity amputee to use his prosthesis, a hemiplegia to write or type with the sub-dominant hand, or a handicapped housewife to resume her responsibilities in the home.

Naturally, in a rehabilitation clinic independence of the handicapped is sought, and an evaluation of the individual's ability to perform the activities of daily living is a prerequisite to training in these activities. They include hygienic care, eating, dressing, putting on and caring for orthopedic apparatus, locomotion, and other skills such as writing and getting into and out of bed.

A point to be stressed is that the department is not a vocational training center; but in order to accomplish the above aims, we have included among our tools clerical equipment (typewriters, mimeograph machine, adding machine, etc.), drafting equipment, hand and power sewing machine, metalwork equipment, (including a metal-turning lathe), jewelry-making equipment, hand and machine wood-working tools, printing equipment, textiles (including weaving materials and fabrics for decorating techniques, such as silk screening and stenciling), art supplies for painting and sketching, a training bathroom and kitchen, and equipment for a variety of manual benchwork tests.

The Physical Therapy Department is well equipped. Many patients, before receiving treatment here, are unable to walk—due in many instances to muscle weakness. With these cases the Elgin table (more commonly known as the DeLarme table) is used for progressive resistance exercises. As a result of this specific technique, muscles are built up to withstand the patient's weight. The table is also used for exercises of the back, abdomen, and upper and lower extremities.

A patient learning balance and step as a prerequisite for walking, uses the parallel bars, where he has security, before advancing to crutches, canes, or the full bearing of his weight.

To prepare a patient for obstacles he will encounter in his own surroundings, we use steps, ramps, and curbs.

Mat work is given to many patients whose legs are paralyzed. In these cases we teach the patients to use their arms and shoulders, so that they may be able to perform wheel chair activities, sit, turn, learn to put on their appliances, and finally to walk with the aid of crutches.

A special treatment room is equipped with treatment tables, a luminous heat lamp, and an electric stimulator.

The aim of our Physical Therapy Department is to enable the patient to live independently, in spite of his handicap.

As was mentioned before, it is important to avoid duplication or overlapping of services. Therefore, we work cooperatively with agencies in the community that may supplement the services here at the Clinic or at the Massachusetts General Hospital. To coordinate the services of the Clinic and those of the community, there is need for a rehabilitation counsellor and coordinator.

The counsellor observes the patient from the time of his admission to his discharge, coordinates the findings of the staff, and sees that the rehabilitation program of each person is individually planned on the basis of an analysis of his total personality, with all of its components. The counsellor takes responsibility for the quality and congruence of planning, and makes discriminating use of the diversified resources in the community which he finds necessary as part of the rehabilitation plan. He assumes continuing responsibility for the outcome of each special service as it relates to the individual's total need.

The majority of patients who have been admitted to the Clinic have been handicapped by industrial accidents, amputations, fractures, arthritis, and neuromuscular disorders. We have serviced or are in the process of servicing 103 patients. These patients have come from all the possible referring sources that were mentioned above. Also, the United Mine Workers of America Welfare and Retirement Fund organization has selected the Bay State Rehabilitation Clinic as one of five such centers in the United States where they are sending their disabled miners for rehabilitation.

As was mentioned in the opening of this article, the Bay State Medical Rehabilitation Clinic is a community project. It is a completely independent, non-profit corporation, aided by anonymous gifts and backed by the Bay State Society for the Crippled and Handicapped, Incorporated. The Clinic provides a new community medical service, deserving the approval and cooperation of the entire medical profession.

Ottilie M. Banks, M.A.,
Rehabilitation Counsellor
and Coordinator

BIOGLETS

Dr. John G. Gibson, Assistant Resident in Psychiatry – born in Belfast, North Ireland, April 14, 1920; M.B., B.C.H., B.A.O., Queen's University, Belfast, 1942; Assistant Extern Surgeon, Royal Victoria Hospital, Belfast, 1943; military service: Flight Lieutenant, Royal Air Force (V.R.), 1944-46; M.D., Queen's University, 1947; Medical Registrar, Royal Victoria Hospital, Belfast, 1947; Senior Resident Medical Officer, Royal Free Hospital, London; Registrar, Nervous Diseases Hospital, Belfast, 1948; M.R.C.P. (London), 1949; Senior Registrar in Psychiatry, Bethlem Royal and Maudsley Hospitals, London, 1949 – (still on staff of Maudsley); married; 2 children.

Dr. Shepard C. Ginandes, Intern on the Children's Medical Service – born in Brooklyn, N. Y., June 7, 1928; A.B., Harvard College, 1947; M.D., Harvard Medical School, 1951; home: Cambridge, Massachusetts.

Dr. Melvin J. Glimcher, 3d Assistant Resident in Surgery – born in Brookline, Massachusetts, June 2, 1925; U. S. Marine Corps: 1942-45; Duke University, Durham, North Carolina, 1943; B.S. in Mechanical Engineering, Purdue University, Lafayette, Indiana, February 1946; B.S., Purdue University, June 1946; M.D., Harvard Medical School, 1950;

Dr. Carter R. Rowe (*Or.* 1939), 264 Beacon St., Boston 16, Mass.

All of you who read the March 1950 issue of THE NEWS will always remember that interesting letter from Dr. Russell T. Congdon (*WS* 1909), in which he told of his early experiences in out-of-the-way sections of the far northwest and of the exciting discoveries made by him and his son Russell S. on their many trips of exploration and excavation.

Although much briefer than the previous one, this letter from Dr. Congdon was most gratefully received.

> Please continue to send me THE NEWS. It would be sorely missed if you didn't.
>
> I expect to attend the meeting of the College of Surgeons at San Francisco in November, and hope to see some of our fellows there. Having my two sons working with me makes it easy to get away for vacations.
>
> We spent a month at Churchill, Manitoba, this summer, pursuing our hobby of bird-photography. We made newspaper headlines by finding a nest of the rare Hudsonian godwit, a large shore bird which is nearly extinct, and obtained good pictures of many handsome birds. Mrs. Congdon is a rare companion on these excursions, enjoying equally with us all the thrills.

We were glad to receive this letter from Dr. John M. Head (*a.r. S*).

> I was called to active duty with the U.S. Public Health Service on July 30, with the rank of Assistant Surgeon, and am working on the surgical ward of the USPHS Hospital in Portland, Maine. So far it has been quite enjoyable; nor does an occasional fishing trip out into Casco Bay detract too much from the daily routine. I have the good fortune to be working under Dr. Reed Broadbent, a medical school friend of Dr. Tom Nielson.
>
> I hope I may be able to revisit the scene of my many MGH crimes before too long.
>
> Please keep on sending THE NEWS. I appreciate being able in this way to keep in touch with events at M.G.H.

In this one letter from Lt. Adolf L. Gundersen, MC, USNR (*a.r. Surg.*) we learned about two of our men—Adolf himself and his brother, Lt. Sigurd B., Jr. (*Surg.* 1949). The letter bears the address Naval Academy Athletic Association, U.S. Naval Academy, Annapolis, Maryland, and reads:

> I don't know whether you have my brother Sig's address or not. He was assigned these past eight months to the Yokosuka Naval Hospital in Japan. After being in various assignments, including the Medical Service, he now has been assigned to the 13th Surgical Team and has been sent to the 1st Marine Division in Korea. His present address is U.S. Naval Hospital #3923, Box 44, c/o Fleet Post Office, San Francisco.
>
> My present work here at the Naval Academy is concerned primarily with athletic injuries. I'll be traveling with the Navy football team this fall, which should be fun.
>
> It is certainly nice to get THE NEWS and keep up with goings-on at the M.G.H.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 107 Boston, Mass. December 1951

NEUROSURGERY

It is three years since the previous report of work on the Neurosurgical Service appeared in THE NEWS. During this period there has been no alteration in the number of patients or operations, both being limited by the space that can be assigned to a specialty in a general hospital. The important changes are related to changes in personnel. Dr. Bertram Selverstone, four years from the termination of his residency, has left our full-time visiting staff to become chief of the service at the New England Medical Center and the first Professor of Neurosurgery at Tufts Medical School. He will be greatly missed. Fortunately, he continues as Clinical Associate here and frequently takes part in our meetings. Dr. Louis Bakay will take his place on the full-time staff when he completes his residency at the end of December.

It is of interest that the Bureau of Medicine and Surgery of the U. S. Navy has sent us three men for resident training. The first two have finished their course. Commander Richard W. Garrity was assigned as head of the neurosurgical service at the large Naval Hospital in San Diego, and Commander William J. James to the corresponding service at St. Albans.

There has been a notable increase in the research staff. Working in the laboratories there are now a Research Associate in Physiology assigned to our service and five Research Fellows. Three medical students have been engaged in full-time research work during their summer vacations and part-time during the academic year. A staff of four technicians is required to work on the various research projects listed below. Funds for the salaries of the workers and the material required have been generously supplied by the Atomic Energy Commission, the American Cancer Society, the U. S. Public Health Service, the Damon Runyon Fund, and an anonymous medical research foundation. The complex technique of our current investigations requires team work integrated with a wide variety of specialists not only in the field of medicine, but also in chemistry, atomic energy, and acoustics. For assistance outside the hospital we are greatly indebted to Harvard Medical School, Massachusetts Institute of Technology, and the Brookhaven National Laboratory. A general idea of the more important projects under investigation by the staff can be obtained from the following summary:

Radioactive mapping of the position and extent of brain tumours: The value of beta emanation from radioactive isotopes of phosphorus and potassium in mapping the extent of tumours in the brain was discovered by Drs. Selverstone and William H. Sweet of this department, with the help of Drs. Charles V. Robinson and Arthur K. Solomon in the Department of Chemistry at Harvard Medical School. A preliminary report of this work was given in the January 1949 article in THE NEWS. The accuracy with which deep tumours can be charted by probing with a micro-Geiger counter was graphically shown in an article in the September number of *Annals of Surgery*. This method of employing weakly penetrating beta emanation at operation is proving to be of greater value than the more deeply penetrating gamma radiation of radioactive iodine combined with fluorescein, which has been advocated in Minneapolis and Chicago. While the latter gives some clue as to the position of a tumour within the intact skull, it is less accurate than the older methods of X-ray pneumography. What is of inestimable value to the neurosurgeon, when he has the cerebral cortex exposed and no abnormality is visible, is to be able to determine the exact depth and extent of the tumour so that he can plan his resection with minimal injury to the brain. Today it is also possible to rely on the counter in the resection of tissue which to the naked eye looks like normal brain but which proves on microscopic examination to contain invading cells of tumour.

Treatment of brain tumours by atomic fission: In conjunction with the Brookhaven National Laboratory, Drs. Sweet, Gordon L. Brownell, and Manucher Javid have been investigating the possibilities of specific radiation of brain tumours by an entirely new principle. If neoplastic cells can be made to pick up an element like boron in considerably greater concentration than normal brain tissue, then these abnormal cells can be subjected to intrinsic radiation when the boron is split to lithium by the passage of a beam of slow neutrons from an atomic pile. The resultant alpha radiation has great destructive force, but such limited penetration that only the area of the tumour is affected. This endeavour has been described prematurely in an unauthorized popular article in *Collier's*. Unfortunately, the uptake of boron as borax by many types of neoplastic cells is not sufficient to supply the desired intensity of radiation. The theory, however, is a most stimulating one and should yield dramatic results if a suitable fissionable compound can be found which will enter the tumour cells in high concentration.

Study of brain tumours by radioautography: Dr. Selverstone, in collaboration with Dr. Daniel Steinberg, now of the National Institutes of Health, has studied the phosphorus metabolism of brain tumours by means of radioautography. In this way it has been possible to make quantitative determinations of the relationship between the microscopic characteristics of certain tumours and the way in which they use the phosphate ion, which is so important to their growth.

Studies of secretion and circulation of cerebrospinal fluid: Radioactive and stable isotopes have also been used by Drs. Sweet, Bakay, and Selverstone to make quantitative determinations of the secretion and circulation of cerebrospinal fluid. This new method has also proved of value in learning more about the poorly understood "blood-brain barrier" (the way molecules of different sizes pass from the blood stream into the brain).

The pressure gradient in the cerebral arteries: Drs. Sweet and Bakay have been making direct measurements of the pressure in the cerebral arteries (including cortical arteries) and the effect of carotid occlusion thereon, recording these in craniotomies with a specially adjusted electromanometer. Data are being collected about the arterial pressure in the carotid arteries and above the circle of Willis which are of clinical as well as physiological importance in handling aneurysms of these vessels.

Possibilities of localizing brain tumours by ultrasound: Two years ago a project sponsored jointly by the Hospital and Massachusetts Institute of Technology was set up to investigate the possible use of high frequency sound waves to delineate the position of the cerebral ventricles. This work is under the combined direction of Dr. Thomas Ballantine of our department and Dr. Richard Bolt, Director of the Acoustics Laboratory of M. I. T. If certain highly technical electronic problems can be overcome, it seems likely that ventriculography for the localization of brain tumours can be carried out more safely and more easily by the use of an ultrasonic method of transmission than by the X-ray techniques which are employed at present.

Investigation of pain pathways by stimulation of somatic and visceral nerves in conscious patients: The role of certain nerves in pain conduction has remained obscure, and testing them in monkeys and other lower mammals has failed to give accurate information, not only because our nearest furry relatives are unable to speak, but because there are often important anatomical differences. As good an anatomist as Ranson made the statement that right- or left-sided visceral pain cannot be relieved by unilateral division of the spinal pain pathway. This is known to be true of the dog, but fortunately is not so in man, as Dr. Sweet and I have learned from our patients after unilateral cordotomy. On distending the pelvis of the kidney or duodenum, our urologists and Dr. William P. Chapman have no longer been able to evoke any pain on the side rendered insensitive by this operation. By direct electrical stimulation in conscious patients under local anaesthesia we have learned that the pain pathway in the anterolateral quadrant of the spinal cord is distributed over a much wider area than is shown in published descriptions, also that only on rare occasions may an anterior spinal root carry some accessory pain fibres. These findings are of considerable practical importance to neurosurgeons who have often claimed that cordotomy is an unsatisfactory operation, when this is largely because they have failed to make their cuts into the cord deep enough. Others have ascribed their failures after section of the sensory spinal roots for post-amputation pain to a supposed exception to the Bell-Magendie law, assuming that painful impulses may ascend in the motor roots. We have likewise been able to test the distribution of pain from structures such as the great superficial petrosal nerve, the various ganglia of the sympathetic chain, and the splanchnic nerves. These investigations have called attention not only to the importance of sympathetic pathways in the direct conduction of visceral pain, but also to the fact that they do not constitute an accessory pathway from the extremities in painful neuromata and phantom limbs after amputation.

Evaluation of frontal leukotomy for relief of suffering and pain: With the help of Drs. Stanley Cobb and Frances Bonner of the Psychiatric Service, we have been testing psychological and mental changes in a wide variety of operations on the frontal lobes. Leukotomy has been advocated by many as a solution for chronic unbearable pain in advanced malignant disease, and even in many neuralgias which in no way shorten the patient's life. Psychiatric tests have convinced us that the deterioration of an otherwise normal individual's personality is much too serious to justify any form of bilateral frontal leukotomy that has yet been advocated, except as a procedure of last resort. Therefore we are campaigning for a return to more specific methods of surgical denervation and are striving to perfect their technique. The statistical results of 220 anterolateral cordotomies reported by White, Sweet, Nilges, and Hawkins (*Brain* 73: 346, 1950) have demonstrated that between 70 and 80 percent of the sufferers from malignant disease in the abdomen and pelvis can be freed of their pain by this operation. Despite statements to the contrary from other neurosurgical clinics, our results have been equally effective in post-amputation neuralgias in the lower extremity, including pain in phantom limbs.

This leaves the cases of malignant disease in the oropharynx and upper thorax, which are difficult to deal with in any other manner than by surgical procedures on the brain. The fear of imminent death from strangulation or hemorrhage may demand relief from mental as well as physical anguish. Provided these unfortunate persons do not survive for more than six months, unilateral leukotomy is proving to be a fairly satisfactory solution. There are still complicating changes in personality, but these have not been serious. As the effects of unilateral leukotomy are of only relatively short duration, this more conservative procedure cannot be expected to give lasting improvement, and serious deterioration is certain to follow a second intervention of the opposite frontal lobe. However, for the worse sufferers from atypical facial neuralgia and post-herpetic pain the preliminary results of resection of the orbital surface of the frontal lobes, which has been carried out by Dr. Sweet and tested by Drs. Cobb and Bonner, have given promise that otherwise intractable pain may be relieved without serious deficit by appropriately limited decortication. Dr. Chapman and our electroencephalographers have taken advantage of these operations to study physiological responses to stimulation of the frontal and temporal lobes of the human brain, a field that heretofore has been explored very little except in lower mammals and in a few of the primates.

In concluding this report I want to take the opportunity to thank the administration and Dr. Churchill for giving us space in the crowded laboratories of the Hospital to carry out this work. We have been singularly fortunate in obtaining the necessary funds from research foundations. Our only serious handicap is the lack of an operating room of adequate size to permit the erection of glassed-in galleries to protect the patients from infection. In prolonged operations with the brain or spinal cord exposed, our patients are submitted to the risk of air-borne infection from the presence of complicated electrical equipment and the personnel required to use it.

James C. White, M.D.,
Chief of the Neurosurgical Service

The Directory section of the soon-to-be-issued Annual Report has been prepared this year, for the first time, in the Archives Department. Should you detect any error in the Directory, no matter how relatively unimportant it may seem to you, it would be greatly appreciated if you would send the correction to Cora F. Holbrook, Archivist and Editor of The News.

* * *

Our Ambulance Service, which was begun in 1873 with the purchase of the first horse-drawn vehicle, was discontinued in October. With the excellent service rendered by Red Cross ambulances from many cities and towns near by and with local ambulances that are always available, our own hospital service is no longer necessary.

TRACY BURR MALLORY

We have lost a beloved friend and a distinguished professional brother. It is fitting this morning, in this place, the scene of his labors, and at this exercise which owes so much of its character to him, that we should pause for a moment from our busy routine and think of him.

The professional accomplishments of Tracy Burr Mallory will presently be duly recorded, no doubt, in resolutions passed in various official places. They are too numerous to be enumerated even briefly on this occasion.

Let us rather think today of our friend himself as we knew him, what he meant to us. I can remember him as a medical student, on the medical wards of this hospital. That was in 1921. My chief recollection of him as of that time is of his sincerity of purpose and his intellectual honesty, his genuine scientific curiosity. He had begun to show the very healthy skepticism which I believe was one of his striking characteristics.

I recall his coming to see me with his wife at Woods Hole in the summer of 1925. This was when we were trying to persuade him to be the successor of his father's collaborator, Dr. James Homer Wright. He thought the proposition through with characteristic thoroughness, but finally, having accepted, he gave everything he had to the job with the utmost loyalty until his death. Faced with facilities which ever became more inadequate, and with steadily increasing volume of departmental work, he maintained always his whimsical good humor and patience.

His office door always stood open, and a smiling welcome there was for anyone dropping in, and wise counsel on whatever problem was presented. I used frequently to intrude on him, as did many others. Never did he say he was too busy, but always had time to listen and to discuss.

Innumerable hospital and university burdens he bore unhurriedly and with equanimity.

He went to war. Did a magnificent job. Returned home and picked up his permanent job again without any fuss, and carried on again in his unhurried but effective manner.

He saw nearly every department but his own get improved quarters and equipment, but never did he show annoyance or bitterness on that account.

These clinicopathological conferences now take the form he set. The Cabots, Richard and Hugh, who started them, discussed most of the cases themselves. Tracy Mallory broadened the base, giving opportunity for most of the clinical staff to participate in rotation, and I believe greatly enhanced their scientific value thereby.

For all these and many other things we

are grateful to Tracy.

Let us stand now for a minute in silence in memory of him.

* * * * *

And now, as he would have wished, carry on with the job.

Read by Dr. J. H. Means at the clinicopathological conference at Massachusetts General Hospital on November 15, 1951.

Published in the New England J. Med., vol. 245, no. 22, 1951.

G. MARSHALL CRAWFORD

Everyone was shocked and saddened by the sudden death of Dr. Crawford on October 18, while he was on a hunting trip on Prince Edward Island. Death was probably due to a heart attack, though no previous symptoms are known. He is survived by his wife, Dorothy B. Crawford of Lincoln, his mother who lives in Shelbyville, Kentucky, and a brother in Seattle.

Dr. Crawford was born in Seattle in 1906 and had his medical training at Northwestern Medical School. After his graduation he had two years of training in medicine in St. Louis and Chicago, and came to the Massachusetts General Hospital in 1933. Following a residency of one year in the Department of Dermatology and Syphilology he entered the private practice of his specialty here in Boston. He became Assistant in Dermatology at Massachusetts General in 1934, Assistant Dermatologist in 1943, and Dermatologist in 1948. For the year 1947-48 he was Acting Head of the Dermatology Department and a member of the Medical Executive Committee. He was also an instructor in the Department of Dermatology at the Harvard Medical School. As consultant in dermatology he served numerous hospitals about Boston, including Massachusetts Eye and Ear Infirmary, Boston Lying-in Hospital, the Free Hospital for Women, the Good Samaritan Hospital, New England Deaconess Hospital, New England Baptist Hospital, and Robert Breck Brigham Hospital. He was Chief of the Dermatology Department at the Mount Auburn Hospital at the time of his death, and was also Dermatologist for the clinic at the Massachusetts Institute of Technology.

Dr. Crawford was a member of the Massachusetts Medical Society and the American Medical Association. He became a diplomate of the American Board of Dermatology and Syphilology in 1939 and was elected a member of the American Dermatological Association in 1948. He held membership in the Society for Investigative Dermatology and the American Academy of Dermatology and Syphilology. In the New England Dermatological Society his loss will be keenly felt, for he had been secretary for two terms and was president at the time of his death, having just been elected to this office last spring. He was also permanent secretary of the Atlantic Dermatologic Conference.

The radiation aspects of cutaneous therapy was a major interest with him and he participated in the Tumor Clinics of Massachusetts General Hospital for many years as a dermatologic representative. Because of his interest in and knowledge of this field he had been selected for several years as lecturer in the radiotherapy symposiums at the meetings of the American Academy of Dermatology and Syphilology. His other interests concerned syphilis, the use of sclerosing agents in the obliteration of vascular nevi, and the use of hormones in dermatology. He had written numerous papers, and was held in high esteem by the members of the various societies to which he belonged.

Dr. Crawford was an excellent teacher, presenting his material in a most logical, clear-cut fashion. He was a sincere, conscientious worker in the clinic. Many of the younger men in training, both residents and graduate students, owe much to him for his assistance and his interest in their desire for knowledge of his specialty. He was unassuming, reliable, and efficient, and he accepted responsibility graciously and well in clinics and associations to which he belonged. Of particular value were his suggestions in the management of clinic and society affairs. These were always practical, diplomatic, and constructive.

His place will be difficult to fill in the clinic, and among his friends and his patients.

[C. Guy Lane, M.D.] C. G. L.

* * *

We want you to know that the attractive new draperies on the Fourth Floor of the Baker Memorial have been given to us by a generous friend of the Hospital.

The Board of Trustees, at their meetings on October 19 and November 2, voted:

To accept with regret the resignation of Dr. Wyland F. Leadbetter as Associate Visiting Urologist, and to appoint him as Clinical Associate in Urology;

To accept the resignation of Dr. Farahe Maloof from the position of Assistant in Medicine, in order to appoint him as Assistant Resident in Medicine, effective as of October 1.

To appoint:

Dr. Francis de Marneffe as Assistant Resident in Psychiatry for one year, beginning January 1, 1952;

Dr. Merle A. Haanes as Assistant in Psychiatry, beginning October 15;

Dr. Si-Chun Ming as Second Assistant Resident in Pathology for the year beginning January 1, 1952;

Mr. Raymond S. Quick as Assistant Physicist for one year, effective April 1, 1952;

Dr. Byron W. Steele, Jr. as First Assistant Resident in Surgery, beginning January 1, 1952.

At their meetings during October and on November 7, the General Executive Committee voted:

That Dr. Nathan E. Silbert's title be changed from Graduate Student Assistant in Dermatology to that of Clinical Fellow and Graduate Student Assistant in Dermatology, effective as of July 19.

To promote:

Dr. Leonard Atkins from Second Assistant Resident to First Assistant Resident in Pathology for one year, beginning July 1, 1952;

Dr. Fairfield Goodale, Jr. from Second Assistant Resident to First Assistant Resident in Pathology for one year, beginning July 1, 1952;

Dr. Hanna Klaus from Second Assistant Resident to First Assistant Resident in Pathology for one year, beginning July 1, 1952;

Dr. John L. McClung to the position of Resident in Anesthesia, as of November 1.

To appoint:

Dr. Abdus-Sattar Adi as Graduate Student Assistant in Surgery for nine months, effective as of September 24;

Dr. Luis I. Arias as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Jose Barzelatto as Clinical and Research Fellow in Medicine for one year, beginning December 1;

Dr. Germain J. Bouchard as Clinical Assistant in Urology for one year, beginning October 1;

Dr. John S. Bray as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. George D. Caldbick as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Goodman Cohen as Clinical and Research Fellow in Medicine, assigned to Cardiology, for the period November 1, 1951 to July 1, 1952;

Dr. Pier C. Curti as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Victor M. M. Diaz as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Rodney H. Foss as Clinical Fellow in Radiology for one year, beginning January 2, 1952;

Dr. John G. Freymann as Clinical and Research Fellow in Medicine, effective November 1;

Dr. Kaiki B. Grant as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Carl A. A. Hernberg as Clinical and Research Fellow in Medicine for a period of four months, effective as of September 20;

Dr. James H. Kelleher as Clinical Assistant in Urology for one year, beginning November 1;

Dr. Francisco Kerdel as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Roeinton B. F. Khambatta as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Luis V. Larralde as Graduate Student Assistant in Pathology for a period of one year, beginning October 1;

Dr. Jean Lepoire as Clinical and Research Fellow in Surgery, assigned to Neurosurgery;

Dr. Carlo Mauro as Graduate Student Assistant in Surgery for one year, beginning October 1;

Dr. Victoriano P. Menendez as Research Fellow in Pathology for three months, beginning October 1;

Dr. Paul H. Nitschke as Graduate Student Assistant in Surgery for one year, effective as of September 17;

Dr. Patrick A. Ongley as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Regulo Otamendi as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. William R. Owen as Clinical and Research Fellow in Medicine, assigned to Cardiology, for the months of November and December;

Dr. Cusrow S. Patell as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Thip Pholpoke as Graduate Student Assistant in Surgery for one year, beginning August 1;

Dr. Huntington Porter as Clinical Fellow in Neurology for the period September 1, 1951 to July 1, 1952;

Dr. German V. Rodriguez as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Lysia Saxe as Research Fellow in Neuropathology for the period September 1, 1951 to September 1, 1952;

Dr. Walter J. Schmidt as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Alfred J. Schwager as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Wiliam D. Sohier, Jr. as Clinical and Research Fellow in Medicine, effective as of October 15;

Dr. Nozomi Suwa as Clinical Fellow in Psychiatry for a period of one year, beginning September 15;

Dr. Melvin L. Taymor as Clinical Assistant in Surgery, assigned to Gynecology, for one year, beginning October 10;

Dr. Paul H. Thomas as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Helen Thomopoulo as Clinical and Research Fellow in Medicine for one year, beginning September 20;

Dr. David Toll as Clinical and Research Fellow to the Children's Medical Service, effective as of November 1;

Dr. Barzillia R. Waldron as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1.

One of the six who received 30-year pins on Ether Day was Miss Catherine Carleton.

Miss Carleton graduated from the Massachusetts General Hospital School of Nursing in 1910, and served overseas with Base Hospital 6 in the First World War, where she was known as "The Belle of Bordeaux". Following her tour of duty overseas, she returned to the Massachusetts General Hospital, where she has served for thirty years as the head nurse on the Fifth Floor of the Phillips House and where we hope she will continue to serve for many years to come.

The head nurses at the Phillips House gave a party on October 16 in honor of Miss Carleton. On this occasion Miss Eleanor Pitman, head nurse on the Fourth Floor, read a delightful poem which she had written about Miss Carleton.

During the week of October 15 Miss Helen Gilmore, head nurse on Baker 6 (formerly on Baker 5) met with a national committee in New York. Miss Gilmore was invited to attend this conference by the chairman of the National Committee for the Improvement of Nursing Services. The subcommittee in which Miss Gilmore worked was summoned by the parent committee to prepare a manual on the head nurse unit.

The committee was made up of head nurses from the Hartford, Bellevue, Walter Reed, and Massachusetts General Hospitals, plus the nursing specialist of the American Hospital Association, a public health nurse employed in a hospital setting, certain staff personnel of the National League of Nursing Education, and Miss Ruth Gillan, Nurse Consultant, Division of Nursing Resources, FSA. The last named acted as temporary chairman of the group.

By unanimous vote, Miss Gilmore was elected to the permanent chairmanship of that group, to continue to work on and to act as consultant to the writer of the manual which will be based upon the findings of the committee on which Miss Gilmore served.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted, though much less frequently than heretofore. It would save your editor considerable time and trouble if you would remember to include that information. Your title should be classified with respect to the subject matter and *not* under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Psychiatry Department may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and *not* to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Pain and some factors that modify it.
Anesthesiology 12:633-641.

Beecher, H. K., Deffer, P. A., Fink, F. E., and Sullivan, D. B.
Field use of methadone and levo-iso-methadone in a combat zone.
U.S. Armed Forces M. J. 2:1269-1276.

Beecher, H. K., Quinn, T. J., Jr., Bunker, J. P., and D'Alessandro, G. L.
Effect of position and artificial ventilation on the excretion of carbon dioxide during thoracic surgery.
J. Thoracic Surg. 22:135-148.

Rudin, D. O., and Eisenman, G.
A method for dissection and electrical study *in vitro* of mammalian central nervous tissue.
Science 114:300-302.

Cardiology

Alimurung, M. M., Rappaport, M. B., and Sprague, H. B.
The auscultatory signs in rheumatic valvular disease: A phonocardiographic correlation.
New England J. Med. 244:1-9.

Bland, E. F.
Rheumatic heart disease.
In Nelson loose-leaf medicine, New York, Thomas Nelson & Sons, pp. 448C-448FF.

Counihan, T., Messer, A. L., Rappaport, M. B., and Sprague, H. B.
The initial vibrations of the first heart sound.
Circulation 3:730-732.

Currens, J. H., Reid, E. A. S., MacLachlan, E. A., and Simeone, F. A.
Metabolic effects of the rice diet in the treatment of hypertension.
New England J. Med. 245:354-359.

Daley, R., Mattingly, T. W., Holt, C. L., Bland, E. F., and White, P. D.
Systemic arterial embolism in rheumatic heart disease.
Am. Heart J. 42:566-581.

Garn, S. M., Gertler, M. M., Levine, S. A.. and White, P. D.
Body weight versus weight standards in coronary artery disease and a healthy group.
Ann. Int. Med. 34:1416-1420.

Gertler, M. M., Driskell, M. M., Bland, E. F., Garn, S. M., Lerman, J., Levine, S. A., Sprague, H. B., and White, P. D.
Clinical aspects of coronary heart disease: An analysis of 100 cases in patients 23 to 40 years of age with myocardial infarction.
J. A. M. A. 146:1291-1295.

Gertler, M. M., Garn, S. M., and Levine, S. A.
Serum uric acid in relation to age and physique in health and in coronary heart disease.
Ann. Int. Med. 34:1421-1431.

Gertler, M. M., Garn, S. M., and White, P. D.
Young candidates for coronary heart disease.
J. A. M. A. 147:621-625.

Hartman, S. A., and Bland, E. F.
Rheumatic fever and glomerulonephritis.
Am. J. Med. 10:47-51.

Johnson, R. P., Messer, A. L., Shreenivas, and White, P. D.
Prognosis in bundle branch block: II. Factors influencing the survival period in left bundle branch block. III. A comparison of right and left bundle branch block with a note on the relative incidence of each.
Am. Heart J. 41:225-245.

Loofbourow, D. G., Callahan, D., and Palmer, R. S.
The rice diet in ambulatory patients with essential hypertension: A two-year study of 105 patients.
New England J. Med. 244:577-581.

Mantz, F. A., Jr., and Craige, E.
Portal axis thrombosis with spontaneous portacaval shunt and resultant cor pulmonale.
A. M. A. Arch. Path. 52:91-97.

Messer, A. L., Counihan, T. B., Rappaport, M. B., and Sprague, H. B.
The effect of cycle length on the time of occurrence of the first heart sound and the opening snap in mitral stenosis.
Circulation 4:576-580.

Purtell, J. J., Robins, E., and Cohen, M. E.
Observations on clinical aspects of hysteria: A quantitative study of 50 hysteria patients with 156 control subjects.
J. A. M. A. 146:902-909.

Rappaport, M. B., and Sprague, H. B.
The effects of tubing bore on stethoscope efficiency.
Am. Heart J. 42:605-609.

Samani, O. T., Gertler, M. M., Hamilton, J. B., and White, P. D.
The eosinophilic response in castrates and non-castrates.
Indian J. M. Sc. 5:77-86.

Wheeler, E. O.
Atherosclerosis, serum cholesterol, and lipoproteins.
Nutrition Rev. 9:167-169.

White, P. D.
Chronic constrictive pericarditis.
Circulation 4:288-294.

White, P. D.
Chronic valvular cardiac disease.
In Cecil & Loeb's Textbook of medicine, 8th edition, Philadelphia, W. B. Saunders Co., pp. 1110-1123.

White, P. D.
Coronary heart disease in midcentury, with a note concerning its military importance.
U.S. Armed Forces M. J. 2:357-364.

BIOGLETS

Dr. Walter M. Haynes, Jr., Intern in Surgery – born in Sanford, Florida, March 2, 1921; U. S. Air Force: in England with the 8th A.F., 1942-45; B.S., University of Florida, 1947; M.D., Harvard Medical School, 1951; married; home: Sanford, Florida.

Dr. Martin B. Levene, 2d Assistant Resident in Radiology – born in New York, N. Y., March 5, 1922; B.S., Massachusetts Institute of Technology, 1942; U. S. Army: Major in Coast Artillery Corps, serving with an Antiaircraft Artillery Gun Battalion in Massachusetts, North Carolina, Virginia, England, France, and Germany, 1942-46; M.D., Boston University School of Medicine, 1950; Intern, Bellevue Hospital, New York, N. Y., 1950-51; home: Brighton, Massachusetts.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Varaztad H. Kazanjian, Consulting Surgeon, received a special honorary citation from the American Society of Plastic and Reconstructive Surgery on October 31 in Colorado Springs. The plaque presented to Dr. Kazanjian reads: "In recognition of his leadership in the organization and development of the specialty of plastic surgery and his outstanding scientific contributions and advancement of its practice."

A review of Dr. Kazanjian's long and outstanding medical career will appear in a subsequent issue of The News.

The first of a series of symposiums for house officers on the Ophthalmic Service and for interested staff members took place on November 7. The subject "Concomitant strabismus: Diagnosis and management" was first discussed by Dr. Charles D. Regan, who was followed by a panel of speakers: Dr. Abraham Pollen, Dr. Virgil G. Casten, and Miss Ann Stromberg, orthoptic technician. The meeting ended with an hour for questions and answers.

Dr. Edwin B. Dunphy, Chief of Ophthalmology, gave a paper before the Southern Medical Society in Dallas, Texas. His subject was "Some external ocular signs associated with constitutional diseases".

Again this year several groups of second year student nurses from the Massachusetts Memorial Hospital, with Miss Mary Petkauskos, Public Health Nurse Coordinator, have visited the Infirmary to observe the work of a specialized hospital and study the unique services the Infirmary offers.

Thirty students have visited the Infirmary this fall, and thirty more are expected early in December. These groups attend speech therapy classes in the Winthrop Foundation and Mrs. Paul Doehler's esophageal voice classes. They inspect the private floors, nursery, and new operating rooms, and hear about the work of the Retina Service, the program in retrolental fibroplasia, and the Boston Eye Bank.

Miss Pauline Moor has accepted a position with the American Foundation for the Blind in New York City, as an Educational Consultant in the area of the pre-school blind child. Miss Moor, a pre-school teacher, came to the Infirmary in 1947. She worked in association with the Foundation for Vision, which sponsors research into the causes of retrolental fibroplasia, and for several years maintained a social service program for retrolental children and their parents. Working with these children, Miss Moor offered a home service which aided parents in matters of training and development.

* * *

New addresses:—

Dr. Lowrey F. Davenport, 700 Spring St., Macon, Ga. (after Jan. 1).
Dr. LeRoy L. Eldredge, Jr. (*a.r.p. CM* 1951), 215 Main St., Hingham, Mass.
Dr. Frederick C. Goetz (*M* 1947), Peter Bent Brigham Hospital, Boston 15, Mass.
Dr. Richard E. Goldsmith (*clin. & res. fel. M* 1950), Cincinnati General Hospital, Cincinnati 19, Ohio.
Dr. Rita M. Kelley (*M* 1947), 264 Beacon St., Boston 16, Mass.
Dr. Michael A. Luongo (*P* 1946), Harvard Medical School, 25 Shattuck St., Boston, Mass.
Dr. Richard G. Nilges (*a.r.s. NS* 1951), 700 North Michigan Ave., Chicago, Ill.
Dr. Ruth E. Stauffer (*a.r.p. N* 1949), Sudbury Road, Concord, Mass.

Brief bits:—

Dr. Edward B. Benedict, Endoscopist on our staff, delivered two lectures recently. On October 18 he addressed the medical staff of Revere Memorial Hospital on the subject "Endoscopy as applied to general practice", and on November 6 he spoke to a luncheon group at the Harvard Club on "Endoscopy".

Dr. Bradford Cannon, Assistant Surgeon at M.G.H., has returned from a trip to the meeting of the American Society of Plastic and Reconstructive Surgery, held in Denver and Colorado Springs, and the meeting of the American College of Surgeons held in San Francisco. At Colorado Springs Dr. Varaztad H. Kazanjian, Honorary Surgeon on our staff, was the recipient of an award presented by the Society, and Dr. Cannon spoke about Dr. Kazanjian's place in American Plastic Surgery and his many contributions to the field. At the meeting in San Francisco, Dr. Cannon presided at one of the sessions of the Forum on Fundamental Surgical Problems and at the Symposium on Plastic Surgery.

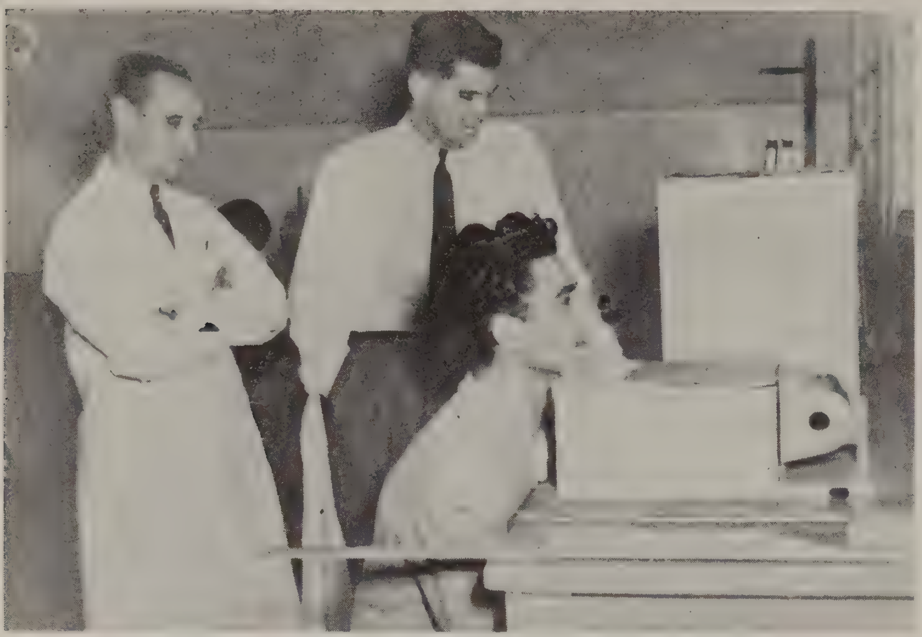
Dr. Chester N. Frazier, Chief of our Dermatology Service, gave a lecture on "Nutritional influences on the physiology of the skin: Observations on the metabolism of vitamin A" at the Karolinska Institute, Stockholm, Sweden, on September 6. Recent visitors to Dr. Frazier's department include Dr. John A. Milne, from the Department of Pathology, Glasgow Infirmary, Glasgow, Scotland, and Dr. Hans Zehetner of the University of Vienna, Austria.

Dr. Howard B. Sprague, Associate Physician at M.G.H., is Chairman of the Scientific Council of the American Heart Association. He returned recently from a trip to the west coast, where he was guest lecturer at the California Heart Association Scientific Symposia held in San Diego, Los Angeles, and San Francisco.

* * *

In our September issue we published a letter from Dr. John B. Stanbury, Assistant Physician at M.G.H. and now in charge of our Thyroid Clinic, telling us about the arrival in South America of the thyroid group sent from this hospital last June. Now, at Dr. Means's suggestion, Dr. Stanbury gives us this report of the further activities and experiences of the group, up to the time of their departure for home.

The Argentineans are extremely patriotic people. The morning of our first day in Men-



Left to right — Drs. Juan Itoiz and John B. Stanbury — engaged in making measurements of thyroid function in an iodide-deficient patient in Mendoza.

doza was spent, first, in viewing the flag which San Martin, the liberator of Argentina who corresponds to George Washington in this country, took with him when he crossed the Andes from Mendoza to liberate Chile from the Spaniards early in the nineteenth century. After appropriate sentiments had been expressed we were driven to a curious, isolated hill which is about 1500 feet high and stands just at the edge of the city. This hill is irrigated and has been developed into a park. On the top of the hill stands a magnificent commemorative statue to San Martin. We then went to view the rooms which had been set aside for our laboratories at the Central Hospital. These were found to be more than adequate in every way. A certain amount of plumbing was necessary and a few minor difficulties were encountered in making proper arrangements for setting up the various pieces of apparatus, but that was all; and the big event occurred in the afternoon when we went to the airport to see our equipment arrive in an Argentine Air Force plane.

There had been considerable difficulty in making prior arrangements for transportation of this equipment from Buenos Aires through the Argentine customs and to Mendoza. However, the Argentine government was very interested in our project and had arranged that our equipment was to be removed from the ship on which it had been transported from Boston, placed upon the Argentine Air Force plane, and flown to Mendoza. This was characteristic of the cooperation we received from the Argentine government and from the Argentine Atomic Energy Commission throughout our entire stay. Anything and everything which we needed, within reason, was provided for us. It would be difficult to imagine more favorable circumstances than those under which we worked.

Our first shipment of radioactive iodide—the first ever to be received in Argentina—came two days later, and three days after our arrival we made our first measurements on patients. For the next seven weeks we made observations on patients every day, and our studies encompassed approximately 125 persons. Many of these were measured every day for as long as four weeks.

Our expedition attracted a considerable amount of attention in the Argentine press. For the first weeks that we were there, hardly a day went by without an article of some sort in the papers, both local and national, about our expedition. This served the excellent purpose of keeping alive the interest of our patients in the project. The result was that with only two exceptions every patient kept his appointment every day.

We were able to make quite a number of interesting observations bearing on the physiology of the iodide-deficient thyroid gland. Many measurements were made to show the extraordinary rapidity with which these patients accumulated the tracer doses of radioactive iodide in their glands and the tenacity with which they held onto it. We also observed the effect of added iodide and added thyroid on patients with iodide deficiency, and the effect of thyrotropic hormone on iodide-deficient thyroid glands. These data are now in the process of analysis.

There was very little time for recreation and amusement because our work program was a heavy one, and the result was that we had insufficient opportunity to see as much of the countryside and as much of the Mendocinas as we should have liked. Everybody was extraordinarily cordial to us, doing everything possible to see that we had a pleasant and profitable time.

At the conclusion of our seven weeks in Mendoza we were flown southward for approximately a thousand miles in an Army Air Force plane to Bariloche. Bariloche is in the southern Andes and is the great summer and winter resort area of the Argentine. It is a lake district, with indescribably beautiful snow-capped mountains rising sheer from the water's edge. It has been well developed for summer and winter sports. Unfortunately, the only day available to us for visiting the ski areas turned out to be rainy, so we were unable to ski. The snowfields are reached by a tramway, very similar to the one at Cannon Mountain. The hotel at the bottom of the tramway is as luxurious as one could imagine. We spent one day in Bariloche making a long boat trip down the chain of lakes, and on our last day there we had a long conference with Ronald Richter, the controversial physicist of Argentina, who is said to have developed a new process for the industrial applications of atomic energy.

Our next stop was Buenos Aires, where we spent four very hectic days. Brownell [Gordon L., M.D., Associate in Physics on our staff] and I gave lectures at the Medical School, and Riggs [Douglas S., M.D., Department of Pharmacology at Harvard] gave one at the Institute of Endocrinology. We also gave an informal conference—one of our most memorable and enjoyable experiences—at Dr. Houssay's Institute. One interesting episode during our stay in Buenos Aires was an hour-long conference with General Peron. To all appearances he seemed a most affable and interested person.

Our trip to Montevideo was by overnight boat. Here again we gave a series of conferences and also visited various medical centers. We were particularly impressed by the laboratories of Dr. De Robertis, who spent several years at the Massachusetts Institute of Technology and who was well known to many people at the M.G.H. Dr. Riggs gave a lecture at the Institute of Endocrinology where Dr. Morato works. Dr. Morato spent last year here with Dr. Allan Butler, as a Clinical and Research Fellow. Dr. Brownell lectured there, also, and my lecture in Montevideo was at the Medical School.

My most interesting experience in Montevideo was a trip up the coast through the beautiful Uruguayan countryside. I found it very reminiscent of the farmlands of Ohio and Indiana, except that every few miles one would pass a group of Gauchos dressed in their Sunday finest and riding on horseback, or a group of natives in a wagon, all sipping mate from their gourds. One disappointment in our trip was our failure to get to Sao Paulo. This was occasioned by weather which made it impossible for our plane to land. Consequently, we had two extra days in Rio.

Here again we all gave lectures and conferences and visited with the workers in experimental medicine. We were particularly interested in the Instituto del Biofisica where Carlos Chagas is chief. The group there impressed us as being active and up-to-date. We also visited the Instituto Oswaldo Cruz where a wide variety of laboratories is concentrated. This Institute is particularly noted for its work on Chagas' disease. We saw several cases of this disease in the small hospital maintained by the Institute, and we also met an Amazonian native with blastomycosis. He had arrived only a few days before and was said to be wearing the first clothes he had ever worn in his life. Rio, of course, is one of the most beautiful cities in the world, without any question. We never tired of snapping photographs or admiring the scenery.

Our last stop was at San Juan in Puerto Rico where we gave two conferences each for the Medical Society of Puerto Rico. It was here that we gave our first formal talk on results obtained in Mendoza. As soon as our conferences were completed Riggs returned to his family in Pennsylvania, Brownell's wife joined him and they went to St. Thomas for a few days' vacation, and my wife and I returned to Boston after two or three days at the Caribe.

This account reads like a travelogue. It would be impossible to recount all our adventures and impressions in anything less than a volume or two. What impressed us most on our entire trip, however, was the pleasantness and cooperative spirit of the Argentineans and the complete lack of anti-Americanism among them. Certainly, it is possible to approach these people at a scientific level. It is unfortunate that it is more difficult to approach them at diplomatic and political levels. Argentina is an enormously important country to us. It seems essential that some way be worked out to increase the mutual understanding between the two countries.

This brief but welcome letter has come from Dr. Ronald C. Bishop (*M* 1945).

I certainly enjoy getting The News each month. It forms a strong link with some very pleasant past associations.

At present I am an instructor in Medicine here at the University of Michigan. My plans for the future remain somewhat uncertain.

Regards to all at the General.

A short note has come from Lt. Col. Gustav G. Kaufmann, MC, USAR (*a.r.p.* 1941). It gives us his new address—U.S. Army Hospital, Camp Edwards, Falmouth, Mass.—and says, in part:

I failed to send you my change of address, as an early return to civilian life had been anticipated. However, it appears as though I shall continue on here at Camp Edwards for a time.

It is always a pleasure to receive The News and to read of the various developments and other bits of information.

THE NEWS

No. 108 Boston, Mass. January 1952

ORTHOPEDIC SERVICE

Since the last report on Orthopedic Service affairs in THE NEWS of July 1949 there have been a number of changes in the Visiting Staff. Dr. Carroll B. Larson left us in July 1950 to assume the position of Professor of Orthopedic Surgery at the State University of Iowa Medical School and Chief of the Orthopedic Service at the University Hospitals in Iowa City. He succeeded Dr. Arthur Steindler in these positions, becoming the Director of an Orthopedic center in Iowa which has gained worldwide recognition. As Dr. Larson was a medical student at Iowa, this represents the return of the native. We wish him well in his new position.

Dr. William N. Jones (*a.r.s. Or.* 1947) and Dr. Thornton Brown (*r.s. Or.* 1949) have joined us as junior members of our Visiting Staff.

Last year a group of Dr. Smith-Petersen's patients joined with his colleagues and former pupils in raising the Smith-Petersen Appreciation Fund. The Conference Room on White 5, with some additional adjacent space, has been remodeled, refurnished, and redecorated. We now have a most comfortable and attractive room, which is primarily for the use of the house staff but which also serves for seminars and staff meetings. There is a smaller adjacent room for reading, record work, and research. The office of the Chief of Service, the secretary's office, and a small working library room complete the unit which has been in operation since May 1, 1951. Air conditioning makes it a pleasant retreat in the hot summer weather. It is a useful and felicitous expression of our respect and affection for Smith-Pete. His portrait, painted by Randolph Aufranc, will soon be displayed in the room which has been unofficially christened "Smith-Pete's Joint".

It is interesting to note that our research efforts are involving more and more cooperative projects with other departments within and without the Hospital. A few examples may be noted:

1. Surgery in rheumatoid arthritis: Drs. Aufranc, Brown, and Jones are working in the Arthritis Clinic with Dr. Bauer's Medical Service representatives, studying the indications for surgery and the end results of various types of operations in rheumatoid arthritis. Their work in this difficult field should prove to be of great value.

2. Low back pain: Supported by funds from the American Mutual Insurance Company and from private sources, our work in this field continues. A booklet, *Syllabus on industrial low back pain,* has been printed, which describes the method of history taking and physical examination in cases of low back disability. It includes notes on the interpretation of signs and symptoms, and a tentative diagnostic classification of industrial back injuries.

Everyone who works in this field recognizes that psychosomatic problems are very common. The doctor who takes the history and does the physical examination often obtains numerous bits of evidence which allow him to conclude that there is "a large functional overlay" — yet the findings on which such a conclusion is based are usually inadequately recorded. The Department of Psychiatry (Dr. Barry) and the Orthopedic Department (Dr. Brown) are now engaged in a combined attempt to determine the recognizable and objective signs and symptoms which accompany psychosomatic back problems and to classify the types of disorders encountered.

Back braces and various types of belts and corsets are time-honored therapeutic devices used by the orthopedic surgeon for the treatment of disorders of the spine. We have been unable to discover adequate scientific evidence of the relative effectiveness with which the various types of braces and corsets immobilize the spine. For the past year a study of this problem has been under way, involving the Department of Civil Engineering at Massachusetts Institute of Technology (Professor Hansen), the MGH Brace Shop (Mr. Buschenfeldt), and the MGH Orthopedic Department (Dr. Norton). Various braces are being tested under standard conditions on volunteer subjects. None of the braces so far tested effectively immobilize the lumbo-sacral spine. It appears that our vague concepts and clinical impressions may be replaced by valid scientific data, as the result of studies in this field.

3. Fractures of the carpal navicular in military personnel: Under the auspices of the National Research Council and aided by a grant from the Veterans Administration we have completed a study of the end results of fractures of the carpal navicular in military personnel. Dr. Hanelin of the Department of Roentgenology, Dr. DeLorme of the Department of Physical Medicine, Dr. Musnick, past Research Fellow in Psychiatry, Drs. Arthur Thibodeau and William Elliston of West Roxbury Veterans Administration Hospital, and the author of this article participated in this study. The report summarizing our findings is now in press.

4. Tendon transplantation in the lower extremities: The National Foundation for Infantile Paralysis has for the past two years supported a clinical end result study of the results of tendon transplantation in the lower extremities in polio patients operated on at the Massachusetts General Hospital. Drs. Reidy and Broderick have reviewed all of our cases and an article on the pertinent findings is now in preparation.

The research projects noted above give some idea of the variety of investigation in which the Orthopedic Department participates. Clinical research of this type is valuable and will be continued. We need to work also in the fields of gross and microscopic anatomy, pathology, physiology, and biophysics. We are actively seeking means to relate our department's activities to these basic disciplines, and we hope to be able to point to progress along these lines in our next report. We know that a sound research program is necessary in order to study our basic problems and to prevent overemphasis of the purely technical aspects of our training program.

Joseph S. Barr, M.D.,
Chief of Orthopedic Surgery

Brief bits:—

Dr. Edward B. Benedict, Endoscopist on our staff, gave a talk on "Cancer of the stomach", as part of a symposium conducted by the Missouri Society of Pathologists, at the Ellis Fischel State Cancer Hospital, Columbia, Missouri, on December 1.

Dr. Milton Henry Clifford, Assistant Physician at M.G.H., has been elected as a representative to the Life Insurance Medical Research Fund by the Association of Life Insurance Medical Directors. Dr. Clifford is Associate Medical Director at the New England Life Insurance Company.

Dr. C. Guy Lane, a member of our Board of Consultation and past Chief of our Dermatology Service, was elected President of the American Academy of Dermatology and Syphilology at the Academy's annual convention, held in Chicago last month.

New addresses:—

Dr. Richard C. Batt (*r. p. R.* 1940), 210 Glen St., Glens Falls, N. Y.
Dr. George Clymer (*Bd. of Cons.*), 77 Eton Road, Longmeadow, Mass.
Dr. Chester W. Fairlie, Jr. (*W.M.* 1942), 85 Jefferson St., Hartford, Conn.
Dr. John F. Hogan (*M.* 1949), Nashville City Health Dept., 802 Second Ave., South, Nashville 10, Tenn.
Lt. Col. Frank A. Mantz, Jr., MC, USAR (*res. fel. Path.* 1949), Percy Jones Army Hospital, Battle Creek, Mich.
Dr. Winfield S. Morgan (*r. p. Path.* 1951), Department of Zoology and Comparative Anatomy, University Museum, Oxford, England.
Lt. Robb H. Rutledge, MC, USAFR (*a. r. S.*), 2141 East 42d St., Savannah, Ga.
Dr. William J. Shriber (*a. M. & a. Phys. M.*), 42 Holman Road, Auburndale, Mass.

MASSACHUSETTS EYE & EAR INFIRMARY

The Infirmary notes with regret the death of Dr. Walter Brackett Lancaster. A graduate of Harvard Medical School, Dr. Lancaster joined the staff of the Infirmary in 1897 as a Clinical Assistant in Ophthalmology. He became a Surgeon here in 1920 and a Consulting Surgeon in 1923. At the time of his death, Dr. Lancaster's work, *Refraction and motility,* was in the process of publication.

Last month we mentioned briefly the special honorary citation conferred upon Dr. Varaztad H. Kazanjian at the meeting of the American Society of Plastic and Reconstructive Surgery held in Colorado last October and said that a review of Dr. Kazanjian's medical career would appear later. At the time of the presentation, Dr. Bradford Cannon spoke about Dr. Kazanjian's many contributions to the field of Plastic Surgery. Here, with some additions, is what Dr. Cannon said:

In 1915 and 1916, before the United States entered World War I, reports came back to this country from time to time of some marvelous things that were being accomplished in the care of injuries of the face and jaws at a British military hospital in France, manned, in part, by personnel from the Harvard Medical School. The name of a certain Major Kazanjian kept cropping up, and by the time the United States entered the war in 1917 his name was familiar to most of those interested in this particular field. Today that Major — Varaztad H. Kazanjian — is recognized internationally as one of the great pioneers in plastic surgery.

Dr. Kazanjian was born in Turkish Armenia in 1879. Encouraged by relatives at home and by letters from abroad to leave Armenia and investigate the opportunities in America, he came to the United States in 1895. In 1900 Dr. Kazanjian became a citizen of the United States and decided to enter the field of dentistry, the alternative choice being a career in engineering. Endowed with a natural manual dexterity, this choice of dentistry was not surprising.

After graduation from the Harvard Dental School in 1905, Dr. Kazanjian was associated with the Prosthetic Laboratory there. In 1912 he entered Boston University Medical School, withdrawing in 1913 when called to be Head of the Prosthetic Department at the Harvard Dental School. At that time, hospital facilities for the treatment of jaw fractures were not available and many patients came to the Dental School, where they were assigned to the Prosthetic Department for treatment. Dr. Kazanjian accepted the challenge of these cases. Over 400 fractures were treated by him during these two years and he made an enviable record. He was one of the first doctors in this country to abandon the unwieldy interdental splint and to adopt the simpler method of intermaxillary wiring.

When the opportunity came in June 1915 to go with the First Harvard Unit to join the British Expeditionary Forces in France as Dental Chief, Dr. Kazanjian was singularly well qualified to serve. At that time there was no Dental Corps in the British Army, and only 15 dentists were available for all the troups. Dr. Kazanjian filled this unrecognized need and laid the foundation for one of the most remarkable services rendered in military hospitals.

Here was a dental surgeon, of unusual ability in prosthetic restoration, suddenly confronted with dozens of soldiers with extensive mutilations of the bones and soft tissues of the face and jaws. With very little previous experience on his part or on the part of other living authorities to guide him, he was given the responsibility for the proper care of these men. That he accepted this responsibility and carried out his duties brilliantly was soon recognized.

Dr. Kazanjian undoubtedly set the standard and formulated the principles of treatment of these particular injuries —principles which were followed so successfully by others in World War I and even World War II. His became the first organized Maxillo-Facial and Dental Unit of the British Expeditionary Forces in France. It continued to function under Dr. Kazanjian, at the official request of the British War Office, until February 1919.

Knowledge of the accomplishments of the Unit spread rapidly through the British Army, and more and more wounded were sent to it. Medical officers were assigned as observers for periods of from two to three months, for the purpose of establishing similar services elsewhere. Dr. Kazanjian was referred to by one English writer as "The Miracle Man of the Western Front". He was made an Honorary Major in the Royal Army Medical Corps, and for his services of nearly four years was decorated by King George V as "Companion" in the Order of St. Michael and St. George. In addition, Dr. Kazanjian was mentioned several times in dispatches. These certificates all bear the signature of Winston S. Churchill.

On his return to the United States in 1919, it was obvious to Dr. Kazanjian that in order to continue with the surgery he had so successfully carried on during the years in France, a gap in his training must be filled. Therefore, he entered the Harvard Medical School in the fall of that year, and received his M.D. degree in 1921.

One incident in his medical school career should be recorded. At a surgical clinic conducted by Dr. Harvey Cushing, two high-ranking officers from the Royal Army Medical Corps were to speak. On glancing up at the students, one of these officers grasped his companion's arm and pointed. They both climbed up the steps and literally dragged a very reluctant student to the floor of the theatre. Dr. Kazanjian was introduced as the one who had taught these guests the technique they were to demonstrate.

Dr. Kazanjian has been appointed to the staffs of many hospitals in New England since 1919. In 1922 he joined the staff of the Eye and Ear Infirmary as a Clinical Assistant in the Department of Laryngology, and in the following years an ever-increasing number of plastic cases were treated at the Infirmary. The Hospital's records consistently cite Dr. Kazanjian's "startling" results in treatment of face, neck, and scalp. In his annual report of 1930, Dr. Harris P. Mosher, then Chief of Laryngology at the Infirmary, reported: "Dr. Kazanjian's . . . work continues to increase in complexity and brilliance."

During this period a Plastic Clinic was established at the Massachusetts General Hospital, under Dr. Kazanjian. This clinic eventually merged with the service in plastic surgery offered at the Infirmary, and from that time has been a joint project of the two hospitals. Patients came to the clinic from considerable distances, for it was a pioneer of its kind in the New England area. In 1931 Dr. Kazanjian was named Surgeon for Plastic Operations at the Eye and Ear and was Special Consultant in Plastic Surgery at the General. Today he is a Consulting Surgeon at both hospitals.

His long teaching career at Harvard began in 1906 with his appointment by the Faculty of the Harvard Dental School as Assistant in Mechanical Dentistry; from 1907 to 1909 he was Assistant in Prosthetic Dentistry; and from 1909 to 1916 he was Demonstrator of Prosthetic Dentistry. In 1913 Dr. Kazanjian was appointed Head of the Department of Prosthetic Dentistry, where he was actively engaged until he left for France in 1915. Since his return to the United States in 1919 he has received the following appointments by the Faculty of Medicine at the Harvard Medical School:

1919-1923	Professor of Military Oral Surgery
1923-1941	Professor of Clinical Oral Surgery
1941-1947	Professor of Plastic Surgery. The Chair of Plastic Surgery was created at that time.
1947-	Professor Emeritus of Plastic Surgery

For several years Dr. Kazanjian has been Visiting Lecturer in Maxillo-Facial Surgery at the Graduate School of Medicine, University of Pennsylvania.

During these years Dr. Kazanjian gathered about him a staff and students interested in the care of deformities of the mouth and jaws, as well as in problems associated with plastic surgery in general. At his clinics, methods of preparation of oral and facial prostheses were developed and appliances constructed for splinting fractures and for post-osteotomy jaw fixation. While the surgical approach has always remained uppermost in Dr. Kazanjian's teachings, he makes expert use of the dental appliance when indicated.

Papers reporting his original work have appeared all through Dr. Kazanjian's medical career. In 1949, in association with Dr. John M. Converse, he published *The surgical treatment of facial injuries.* This book drew from a background of more than thirty years of practice.

During his many years as surgeon and teacher, Dr. Kazanjian has persistently sought, and won, recognition for Plastic Surgery in a professional environment that has been traditionally reluctant to accept any of the sub-specialties of general surgery.

Last October, at a meeting in Colorado Springs, the American Society of Plastic and Reconstructive Surgery presented Dr. Kazanjian with an honorary citation—

> . . . In recognition of his leadership in the organization and development of the specialty of plastic surgery and his outstanding scientific contributions to the advancement of its practice.

Dr. W. Morton Grant was selected as recipient for the initial annual award of the New England Ophthalmological Society, presented to a resident of New England who has made a contribution of outstanding merit to Ophthalmology. Dr. Grant received the award for his work on measurements of pressure in the eye in relation to the study of glaucoma. The presentation was made at the Society's meeting on December 19 at the Infirmary.

Several Eye and Ear staff members were speakers at this meeting. Dr. Parker Heath, Director of the Pathology Laboratory, gave a clinico-pathological discussion; Dr. Robert H. Monahan read a paper on "Channels in the crystalline lens capsule"; and Dr. Edwin B. Goodall presented "A biographical sketch of John Dalton". Dr. Albert E. Sloane demonstrated a Collapsible Maddox Cross.

Dr. Bernard Zonderman of the Winthrop Foundation and Miss Helen Patton, speech therapist of the Foundation, took part in a panel discussion on "The auditory speech program of the partially deafened child", held at the New England Speech and Hearing Convention on November 24. Miss Patton presented a speech therapy demonstration with two of her young pupils.

Dr. Ernst Froeschels was a recent visitor at the Infirmary and one of the guest speakers at the New England Oto-Laryngological Meeting held here in late November. Dr. Froeschels, now practising in New York, is a former Professor of Phoniatrics at the University of Vienna.

Dr. Robert H. Monahan, Fellow in Pathology, working under Dr. Parker Heath, has left the Infirmary and will practise in St. Paul, Minnesota, in association with Dr. T. J. Edwards. Dr. Monahan will also instruct at the University of Minnesota Medical School, in the Department of Ophthalmology.

On Friday, November 23, Dr. Frank H. Lahey, head of the Lahey Clinic in Boston, delivered a lecture entitled "Inflammatory and malignant lesion of the colon and rectum", thereby initiating the winter series of educational lectures sponsored by our Surgical House Staff. It is the purpose of this series to bring, each month, an outstanding man from another hospital to talk on a subject of general surgical application and to have a member of our own Visiting Staff lead a discussion period following each paper.

The MGH Surgical House Officers cordially invite the House and Visiting Staffs to attend this series. The lectures will be given on the third or fourth Friday of each month, at 5 P.M., in the Bigelow Amphitheatre. Announcements of each speaker and his subject will be posted on the bulletin boards here in the hospital.

The Board of Trustees, at their meetings on November 16 and 30, voted:

To establish a special fund to be known as the Tracy Burr Mallory Memorial Fund, to be used for some suitable memorial in the new Pathology Building.

To appoint:

Dr. James C. Appleton as Assistant Resident in Anesthesia for three months, beginning January 1;

Dr. John C. Nemiah as Assistant in Psychiatry;

Dr. Peter E. Sifneos as Resident in Psychiatry rather than Assistant Resident, to begin January 1;

Dr. Jacob H. Swartz to the Board of Consultation;

An additional Intern on the Children's Medical Service, to be rotated through an assignment in clinical laboratory service.

CORRECTION: Due to a typographical error in a Trustees' vote sent us last month, we reported in the December issue that Dr. Merle A. Haanes had been appointed Assistant in Psychiatry. Dr. Haanes was appointed Assistant in Dermatology, beginning last October 15.

At their meetings on November 21 and 28, and December 5, the General Executive Committee voted to appoint:

Dr. Javier Correa as Clinical and Research Fellow in Medicine, effective as of December 1, 1951;

Dr. Donald S. Fredrickson as Research Fellow in Medicine, effective as of October 1, 1951;

Dr. John Gergely as Research Fellow in Medicine, effective as of October 1, 1951;

Dr. Charles L. Leach as Clinical Fellow in Surgery, assigned to Endoscopy, for the period December 1, 1951 through February 29, 1952;

Dr. Sergio A. Leiseca as Graduate Student Assistant in Surgery for a period of one year, beginning November 1, 1951;

Dr. John F. Muxworthy, Jr. as Clinical and Research Fellow in Anesthesia for one year, beginning August 1, with assurance of reappointment for a second year. In addition to his duties in Anesthesia, Dr. Muxworthy will work on Dr. Beecher's Antitussive Study;

Dr. Stuart Ragland, Jr. as Clinical and Research Fellow in Medicine for the period October 1, 1952 through September 30, 1953;

Dr. Kurt F. Schmidt as Fellow in Anesthesia for two years, beginning April 1;

Dr. Peter A. J. Smith as Research Fellow in Dermatology, effective as of December 1, 1951;

Dr. George J. Warren as Clinical Assistant in Urology, for service in the Out-Patient Clinic, beginning November 1, 1951.

The Committee also voted to extend the appointment of Dr. John A. Benson, Jr. as Clinical and Research Fellow in Medicine for another year — July 1, 1952 through June 30, 1953.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to The News.

The following new titles have been received:

Cardiology

Bland, E. F., and Jones, T. D.
Rheumatic fever and rheumatic heart disease: A twenty year report on 1,000 patients followed since childhood.
Circulation 4:836-843.

Chapman, W. P., Hamlin, H., Freshwater, D. B., Livingston, R. B., Sweet, W. H., Poppin, J. L., and Emery, F. J.
Present evidence concerning the relationship of the cerebral cortex and/or subcortical areas to the regulation of blood pressure and heart rate in man.
1er Congrès, Mondial de Cardiologie 1:77, Paris, J. Baillière et Fils.

Endoscopy

Benedict, E. B.
How the endoscopist can help.
G.P. 4:34-40.

General Surgery

Raker, J. W., Wight, A., Michel, A. J. D., and Cope, O.
A clinical and experimental evaluation of the influence of ACTH on the need for fluid therapy of the burned patient.
Ann. Surg. 134:614-616.

Neurology, Neurosurgery, and Psychiatry

Stokholm, H., and Cobb, S.
Book review: Fundamentals of psychoanalysis, F. Alexander, New York, W. W. Norton, 1948.
Psychosom. Med. 13:267-269.

Nursing Education

Sleeper, R.
We study our basic program: A report of an experimental program which provides for an eight-months period of internship in nursing practice.
Am. J. Nursing 51:681-683.

Ophthalmology

Sloane, A. E.
Analysis of methods for measuring diplopia fields: Introduction of device for such measurements.
A.M.A. Arch. Ophth. 46:277-310.
Sloane, A. E.
Massachusetts vision test.
Guildcraft 25:21-32.
Sloane, A. E.
Refraction Clinic.
Am. J. Ophth. 34:1443-1444.

Orthopedic Surgery

Cave, E. F.
Nonbony injuries to the knee.
Surg. Clin. North Am. 31:1355-1368.

Proctology

Speare, G. S.
Melanosis coli: Experimental observations on its production and elimination in twenty-three cases.
Am. J. Surg. 82:631-637.

Radiology

Robbins, L. L., and Land, E. H.
Application of the Land method of film processing in roentgenology: Preliminary report.
J.A.M.A. 147:1217-1219.
Wyman, S. M., and Scholz, F.
A preliminary report on radiography in rapid sequence.
Radiology 57:748-751.

* * *

RADIOLOGY DEPARTMENT

At the annual meeting of the Radiological Society of North America, held at the Palmer House, Chicago, December 2—7, an exhibit presented by Dr. Stanley M. Wyman and Dr. William R. Eyler was awarded Second Prize. The title of the exhibit was "Sequestration of lung associated with anomalous systemic pulmonary artery". The material included roentgenograms and colored prints of pathologic specimens illustrating the salient features of the condition.

At a meeting of the Society held December 4, Dr. Wyman read a paper dealing with the material presented.

At the annual meeting of the American Roentgen Ray Society, held in Washington last September, Dr. Eyler and Dr. Robbins gave a Refresher Course entitled "Roentgen examination of the acute abdomen".

Dr. Robbins was in Minneapolis from October 29 to November 3, participating in the Course on the Chest at the Center for Continuation Study at the University of Minnesota. He gave three lectures and took part in Case Conferences; and on November 2, at the fall meeting of the Minnesota Roentgen Ray Society, he presented a paper on the application of the Land method of processing in roentgenology.

In November, Dr. Robbins spent a week at the Tripler General Hospital in Honolulu, as Consultant in Radiology, at the request of the Surgeon General of the U.S. Army.

In a publication which so often features letters and reports of distant travels it seems a little out of place to describe merely a jaunt across the river to M. I. T. However, for me it was a new world and perhaps some of the rest of you will find this account of my experiences there interesting.

One of the phenomena we observe most frequently is the healing wound. We read about the role of vitamins, hypoproteinemia, infection, the alarm reaction, etc. in wound healing, and watch the yearly parade of new ointments, applications, etc. as reported in the journals. During his experiments on biological effects of radiation, Dr. John R. Loofbourow, Professor of Biophysics at M. I. T., made some interesting observations. He demonstrated that irradiated yeast cells released or perhaps synthesized some unknown products which stimulated the growth of normal yeast. The same sort of process has been observed in tissue cultures, with regenerating amphibians, with embryos, etc., and many years ago Alexis Carrel formulated the hypothesis that leukocytes secrete unknown substances (trephones) which stimulate healing.

This was a matter of some surgical interest, and Dr. Loofbourow agreed that it would be worth while to re-examine Carrel's hypothesis. So in January 1948 we started out. We were able to separate the red from the white cells in blood without even the trauma of centrifugation, merely by adding fibrinogen. The red cells formed rouleaux which settled out, leaving the white cells in the supernatant fluid. However, we needed larger amounts of starting material than was practicable with blood, so we went back to the yeast, which, of course, we could buy by the pound.

The fluids released from the damaged yeast stimulated the oxygen consumption of normal yeast, as well as its growth. But these kinetic studies, as will be published by Mr. S. J. Adelstein (H. M. S. 1952), did not offer the clues regarding mechanisms, as we had originally hoped. Studies of the radioactive phosphorous turnover of the nucleotides performed with Mr. M. J. Abbate (currently at C. H.) taught us a lot about P^{32}, but will have to be repeated with improved ion exchange methods.

In speculating about possible mechanisms of stimulation of cellular growth our attention was drawn to the work of Dr. William F. Loomis and Prof. Fritz Lipmann on mitochondria. These little intracellular factories burn 40-odd fatty acids and Krebs cycle substrates producing ATP, which seems to be the chief source of energy for all cellular activities and chemical syntheses. They showed that dinitrophenol, and later, aureomycin, diminished the energy yield (ATP), while oxidation proceeded unimpaired. Prof. C. Martius's recent lecture at M.G.H. (September 1951) suggested that the mitochondria may be the site of action of thyroxin. This may be true for other drugs, hormones, etc., including our x factor. Indeed, our fluids did stimulate oxidation and ATP formation, but only by replacing the adenosine-5-phosphate nucleotide. So we were still no further along with our main problem.

The most direct attack, of course, was fractionation of the fluids. However, Dr. Loofbourow's experiments had indicated that the unknown growth factor seemed related to the nucleotide fraction. The chemical separations for nucleotides had given Dr. Loofbourow contradictory results, and meanwhile the sensitive and powerful methods of ion exchange chromatography had been applied very successfully by Dr. Waldo E. Cohn (formerly of the Huntington). After a trip to his lab at Oak Ridge, we built an automatic fraction collector which operated day and night during the week necessary for each analysis, and we were able to separate 7 distinct fractions.

Even though Dr. Churchill extended my leave of absence another year, I was unable to finish the project. Dr. E. D. Thomas, currently at P. B. B. H., had meanwhile taken a spontaneous interest in the problem. He refined the method so that 2 new fractions were separated and finished the identification of the fractions, using paper chromatography. We were disappointed that none of the nucleotides thus isolated stimulated growth, and we still do not know the nature of Dr. Loofbourow's "wound hormone". However, several other interesting things came out of the analyses, and ion exchange will be a very useful method for study of nucleic acid.

M. I. T. is a warm and congenial place, and I enjoyed the friendly interest and stimulation of the chief, Professor F. O. Schmitt, and many of the junior members of his department who have been or later became connected with M.G.H., including Jesse F. Scott (Research Fellow in Medicine), Jerry Gross (Research Associate in Medicine), M. A. Jakus (Retina Foundation), Robert D. Griesemer (Dermatology 1949), William F. Loomis (Research Fellow in Biochemistry 1948) and his technician, Helen Vavoudes. Professor Loofbourow's wife, Dorothea (past Assistant in Medicine at M.G.H.), was well known to all of us here, and Professor Loofbourow shared her warm human insight and interest in broader medical problems. Their death, a week apart, was a great personal tragedy. Although a top-flight physicist, Professor Loofbourow never seemed perturbed by a surgeon's ineptitude.

The role of the surgeon in research is, I suppose, something every surgeon decides for himself. I believe that the methods and findings of the basic scientists can be applied to surgical problems, and at M. I. T. I learned that it is fun to try to accomplish this.

On November 1, 1950 I returned to the Surgical Service here.

Falls B. Hershey, M.D.,
1st Assistant Resident in Surgery

As you know, our Archives files contain the hospital service records of every member of the MGH house and visiting staffs, from 1821 up to and including the present time. Among these records are many letters, newspaper clippings, and other items which supply interesting information of a personal nature. To augment this material, in 1949 The News began to publish short biographical sketches, called "Bioglets", of new members of our house staff. These sketches are attached to the individuals' records and may prove to be just as valuable to future historians of the Hospital as our earlier records have been.

But, with all this coverage, one group here at M.G.H. has not received comparable attention. We are speaking of those from countries outside the United States who are working or studying here on fellowships or through similar arrangements. Frequently, in conversations with these men and women we chance upon most interesting bits of information concerning past experiences, and it is our desire and hope to publish as many of these accounts in the future as space will permit. To launch the plan with an excellent illustration of what we mean, this is what we learned about Dr. Thip Pholpoke, here now as a Graduate Student Assistant in Surgery:

"Dr. Thip" is a native of Thailand. In November 1950, as a Major in the Thai Expeditionary Force in Korea, he headed a surgical team which worked its way up through the middle of the peninsula as far as Pyongyang, just in time to meet the first onrush of the Chinese which broke the U.N. lines and sent them reeling back. In March of 1951 he returned to Thailand. In June he was sent to France as his country's official delegate to the Thirteenth Congress of International Military Medicine and Pharmacy. From there he came to the United States. After two years' study in this country, he will return to Thailand to serve in the Army Medical Service.

"Dr. Thip" graduated from Chulalongkorn University, Bangkok, in 1936; during 1937 he was an Intern and attended the Basic Course for Medical Officers at the Military Hospital and Army Medical Department in Bangkok; from 1938 to 1940 he was a Resident in the Third Military Command Hospital at Nakorn Rajsima; from 1940 to 1946 he served as Regimental Surgeon in various regiments and divisions; and from 1947 to 1950, when he was sent to Korea, he was Assistant Surgeon at the Military Hospital in Bangkok.

A question concerning his whereabouts during World War II brought this reply. "I was in the jungle part of the time, among those in the thin lines spread out along Thailand's border." Then he added, "Our people are freedom-loving people. The word 'Thai' means 'free', literally."

See what we mean? Many of us are in almost daily contact with visitors here from other lands but are in complete ignorance of anything concerning them except their immediate professional activities. We once published a long list of the many countries represented here at M.G.H., but there is so much more, and of greater interest to us, than the mere name of an individual's homeland. So — if you are here from a country outside the United States, please inform your editor of that fact very soon, and *do please* include also an outline of your previous professional work and any of your personal experiences which would be of interest to our readers and a worth-while addition to your service record here in the Archives file.

We hope to be able to continue this new feature in The News. Whether we can or not depends upon the responses to this suggestion. We already have in mind a fitting insigne to head the new section. It might well be a miniature drawing of the globe—done in Mercator projection, in order to include the countries in both hemispheres. Do we hear an artist volunteering for that job?

♣ ♣ ♣

PODIATRY CLINIC

During November of 1929 a Podiatry Clinic for the care of diabetic and circulatory patients was established as a result of the combined efforts of Dr. Arthur W. Allen and the late Dr. Washburn, past Director of the Massachusetts General Hospital.

The Podiatry Clinic, now beginning its twenty-third year, developed gradually, at first caring for a few patients weekly and progressing to its present activity. Originally, patients were referred from the Diabetic and Circulatory Services only; then the Dermatological and Orthopedic Services were added to the list, resulting in an individual Podiatry Clinic for the use of the entire Out-Patient Department. The average number of patients treated each week is about twenty, plus Staff Clinic patients and student nurses. The personnel of our group consists of a supervising nurse, a student, and one podiatrist.

All patients with foot ills are seen Thursday mornings, when each patient is taught routine foot care and warned against improper treatments. The foot liability of these patients can be very high. Cooperative patients have avoided hospitalization and major foot and leg surgery because of the routine acquired in this Clinic.

Like all new ventures, the Podiatry Clinic has had its ups and downs. Having been with the group since its inception, I know that many hours of hard work have been exerted to standardize this Clinic. Our major problem was to find a suitable location. I don't believe that any other clinic in the Hospital has changed its physical situation as often as has ours.

Podiatry being so very important to both vascular and orthopedic difficulties of the lower extremities, it was sensible to have the foot service easily available to either or both. It was finally decided to move Podiatry to the Orthopedic Clinic, and a resulting workable clinic evolved.

With an increase in our personnel, additional foot problems could be treated and more patients could be seen. A one-man clinic is restricting.

I am happy to have groups of student nurses visit the Clinic each week and hope we are able to add something to their "Foot Care" program. The nursing care given to circulatory patients' feet is most important.

In conclusion, I extend an invitation to all to visit our Thursday morning Podiatry Service. It has given me great pleasure to have been with the Clinic since its birth, and I hope I shall be able to continue on at M.G.H. for some time to come.

John F. Kelly, D.S.C.,
Head of Podiatry Clinic

This letter from Dr. Hugh Chaplin, Jr. (*M.* 1948) needs no qualifying adjective. It speaks for itself. It is our hope that, besides its interest value, it will serve the purpose of not only stinging the consciences of all of you who have failed to write that long-overdue letter to your News, but will cause you enough discomfort to nag you into action.

From his present address — 28A Keswick Road, East Putney, London SW 15, England, Dr. Chaplin writes:

> I want to begin by saying something trite—but I make no apologies, for most trite things are eminently *true* — and that is to emphasize how much pleasure each copy of The News brings to me via its monthly trans-Atlantic journey. Until I left M.G.H. I never really appreciated what wide coverage The News gives to the over-all activities of the Hospital, and all the details are music to the ears of its devoted friends, however far away they may be.
>
> Though it has been only just a year since I departed from the West Medical Service and from the U.S.A., a lot seems to have happened both there and here in those swift months. I imagine with pleasure the hum of activity in the new Research Building, which was not completed when I left, and I wonder with mixed feelings at the fate of the OPD Dispensary.
>
> But, perhaps you will be interested in a few thoughts from England — for these have been months of great change on this little island. From a general point of view, two things are of particular interest: the recent change in the Government, and the economic crisis England faces. It is difficult to inter-

pret with certainty the meaning of the end of Socialist rule in this country after its stormy but persistent survival through the postwar years. One thing is certain: it does *not* mean a major change in public sentiment or point of view. The Conservatives will have to maintain many of the "socialist reforms", and they will have to govern with an infinitesimal majority in the House of Commons. (The Socialists polled more votes in this election than in any previous one.) I think the changes wrought by the recent election express the British people's desire for a firmer stand in foreign affairs than the Socialists were interested in maintaining, plus a faint hope that a change in government might work some miracle in the economic crisis in which England finds itself. The nation is tottering on the brink of economic disaster—the result of two major wars, combined with the shrinkage of the Empire and the difficulty of maintaining exports in the face of rising costs of all imports. The English have taken hitch after hitch in their belts to meet this problem — they eat less meat now than at any time during the war, they cannot buy a new car without three to five years of waiting, they simply cannot buy such things as cashmere sweaters, fine tweed, etc., for these items are rigidly restricted for export only. Taxation has wiped out many of the wealthy families and will wipe out all of them if it remains as now for another generation. Income is so highly taxed that it is impossible for anyone to amass a large fortune these days. The added burden of pulling their weight in European rearmament may prove to be the last straw — in fact, it is commonly held that England simply cannot do it without increased American aid. All these things, plus the tension in the Near East, the seemingly endless attrition in Korea, and the inexorable mounting of inflation put the nation under heavy strain. Let us hope that under Churchill and with U.S. aid they will find their way out of this sea of troubles — for England is the strongest ally of the United States, and the consequences of a bankrupt and beaten England are too alarming to contemplate.

Medically, this year has been fascinating from many aspects. I shall not attempt in this letter to evaluate "socialized medicine" as it exists in England. Space is too limited. Two comments may give some perspective to the problem: first, the extent of the benefits guaranteed under the plan have recently been curtailed — charges are now being made for spectacles and dentures, and it is likely that free medicines, prostheses, etc. will also be more strictly controlled; secondly, there is no suggestion that the whole program will be shelved — the majority of the people and, I think, of the physicians, also, feel that the program represents an improvement over preexisting conditions and deserves further trial.

Two things in connection with the teaching hospital with which I have been associated have struck me in particular. First, the relation of the student to the entire hierarchy of the medical staff, from the intern right through to the professor, is a distinctly remote one. There are exceptions to this, of course, but the friendly informal rapport enjoyed by medical students at American schools, and at the M.G.H. in particular, simply does not exist here — and a great pity it is. I suppose it is merely a less extreme aspect of the "Continental" professor-student relationship which Bob Berg told us about on his return from Sweden last year — but, in any event, I do not think it has anything to recommend it over the American system. Secondly, the position of nurses in England, especially their relationship to staff and visiting physicians, is markedly different from what I had been used to. Here, the nurses are not known by name to most of the doctors with whom they work closely, they hesitate to offer suggestions, and active cooperation and mutual consultation between physicians and nurses is a rarity. The quality of nursing care, as far as the patients are concerned, is very high, but the doctor-nurse relationship is almost nonexistent. This is a situation which is foreign to those of us who trained at the M.G.H., and I'm sure we all share Miss Sleeper's enthusiastic campaigning for maintaining and increasing the benefits which are to be obtained from close cooperation between physician and nurse.

English medical research, judging from what I have seen of it, is of a very high order — honest, carefully planned, critically executed, and productive of many significant advances. The group with whom I am fortunate to be working is entirely delightful and stimulating.

I find that I am to be placed on active duty for the U.S. Public Health Service, to continue my work over here in England for another year. I look upon this as a fine opportunity and anticipate another happy and fruitful year. Do not misinterpret any of my criticisms as bespeaking a basic displeasure with England or the English. London is a fascinating city in which to live, and English traditions are inspiring and basically identical with American traditions, in the main. Though I shall miss getting back to see the M.G.H. as soon as I had hoped, I shall be happy in the anticipation of doing so in 1953, and I shall continue my work here quite content among the warmly hospitable and cordial English friends I find all round me.

Best regards to all my friends over there

A card from Dr. Benson B. Roe (*W.S.* 1943) announces the opening of his office for the practice of General and Thoracic Surgery, at 536 Mason Street, San Francisco 2, California. Dr. Roe adds this note:

Will write you a decent letter when I get settled down and caught up on essentials.

Have just opened my office here. Have been appointed Assistant Clinical Professor of Surgery at the University of California.

It is good to receive The News and to keep up with friends.

Dr. John W. Smillie (*E.S.* 1944) sent us a new address on his subscription card —Division of Ophthalmology, Box 32, University of Minnesota Hospital, Minneapolis 14, Minnesota — and enclosed the following letter:

The News is most welcome because, in addition to keeping us informed as to the progress of M.G.H., one also learns about the locations and activities of former associates.

After doing EENT work for two years at the Out-Patient Clinic in Washington, D. C., the U.S. Public Health Service reassigned me to the Ophthalmology Division of the University of Minnesota Hospital. This is the second year of my eye residency and I am now a Surgeon (Lt. Commander) in the USPHS.

Dr. Robbins was a recent guest here in our X-ray Department.

THE NEWS

No. 109 Boston, Mass. February 1952

PHYSICAL MEDICINE DEPARTMENT

Since our last report for THE NEWS, the tenth anniversary of the opening of the Physical Medicine Department has passed, so perhaps it is appropriate to review its progress over the past decade. The Department still occupies the same space originally assigned to it, which was formerly the nurses' and house officers' dining room and kitchen on the second floor of the Domestic Building.

Service to patients: During the first year of operation the Physical Therapy Department quickly took on a full treatment load for the space and staff available. Sixty percent of the patients at that time were out patients, and the Orthopedic Service referred about sixty percent of all its patients. Therapeutic exercise of a standardized type was the most popular treatment procedure, local heat applications and sedative massage preceding it in most prescriptions. Only ten percent of physical procedures were of the more complicated variety, including electrotherapy. Eighty percent of the treatment load at that time came from either the hospital wards or the Out-Patient Department. At present thirty-two percent of new patients are referred from the Baker Memorial or are ambulatory Baker patients, usually industrial accident cases. Four percent are referred from the Phillips House. During the war years there was a decrease in staff personnel and in the number of treatments given, many patients simply receiving instruction for home therapy. This is brought out by the average number of treatments per patient, which dropped from 13 to 9. At the same time there was a decrease in the number of out patients from 12,000 to 6,500 per year.

The Occupational Therapy Department antedated the Physical Therapy division but became physically combined with it when the Department opened in the Domestic Building, except for a shop in the psychiatric ward. From the beginning, attempts were made to correlate the two services and to provide medical direction for both. This culminated in the forming of the Physical Medicine Department in 1944, combining the two technical divisions—the close coordination of the two therapies being quite apparent, as thirty percent of the treatments given were a combination of both techniques. The term "physical medicine" was more appropriate, as twenty percent of referrals were found to be for diagnostic or prognostic purposes rather than for therapy, only.

There was a rapid increase in the number of patients referred and treatments given after the war, reaching a peak in 1947. At the same time a change occurred in the type of procedure utilized. The most signal technical advance was the introduction of a new exercise method developed by Dr. Thomas L. DeLorme, a fellow in Physical Medicine. The term "progressive resistance exercise" was coined here to describe it. Funds were obtained from the Pope Foundation to aid in the development and study of this method of exercise. It was found that a wide application of this method is safe and that this is a most efficient way to develop muscle power. There has been a growing emphasis on different types of therapeutic exercises in addition to the use of progressive resistance, particularly the special technique used in gait-training for neurological patients and those with artificial limbs. There has also been an increase in the number of patients with arthritis referred for supervised exercises. In Occupational Therapy the trend has been away from diversional activities, with more emphasis on treatments to develop better range of motion, and skill or strength—the terms *kinetic* and *energic* being used to describe these methods. Expansion in this department also included some music therapy by a part-time worker for the Massachusetts General Hospital and also a part-time occupational therapist for Storrow House in Lincoln.

During the past three years there has been a definite emphasis placed on medical rehabilitation procedures. A most striking example of this is in relation to the Amputation Clinic, which is a team project of the Orthopedic, Surgical, and Physical Medicine Departments, together with the Social Service Department and representatives from the Department of Vocational Rehabilitation and the different local limb manufacturers who attend the Clinic. For hospitalized patients, such as those with arthritis, hemiplegia, or other neurological conditions, efforts are made to evaluate the patient's ability to perform the acts of daily living and also in a limited way to test manual skills in relation to prevocational guidance.

Since June of 1951 a more complete rehabilitation service has been available to patients in the Massachusetts General Hospital, including the Baker Memorial and Phillips House, because of the location of the Bay State Medical Rehabilitation Clinic in what was formerly Ward I. It is now possible to give a full day's treatment devoted to physical rehabilitation in this Center. The Physical Therapy section is so designed that group practice in gait-training and mat work for paraplegics is available, and in Occupational Therapy the shop is especially designed to analyze occupational skills in relation to possible employment or greater self-independence for the more handicapped patients. Rehabilitation counseling is also provided. There is no duplication of the more complicated physical therapy procedures, such as hydrotherapy, diathermy, and ultraviolet irradiation, which are available to the Bay State patients in our Physical Medicine Department when needed.

It is now possible to hospitalize patients for purely rehabilitation purposes in the Baker Memorial or Phillips House or on the Massachusetts General Hospital wards and give them proper medical direction throughout their period of medical rehabilitation and, through contacts which are made with other agencies, direct them to vocational rehabilitation and employment, although no vocational training is supplied in the Bay State Clinic. There are already, on the average, about ten hospitalized patients who are seriously injured or handicapped and referred for the purpose of rehabilitation because of the combined services available from the medical staff of the Massachusetts General Hospital, the Department of Physical Medicine, and the Bay State Medical Rehabilitation Clinic. These patients come to us, for the most part, from the United Mine Workers of America and various insurance companies in this area.

Personnel: The Medical Director and the physical therapy supervisor are the only members of the Physical Medicine Department who have remained here since the opening, although the assistant head physical therapist has been here nine years. We have had a fairly rapid turnover of the younger staff members, as the Department is a popular one for recent graduates to get experience under proper supervision. The most significant change in personnel has been due to the organization of a fellowship training program, aimed to prepare young physicians for the American Board of Physical Medicine and Rehabilitation. There has been developed an affiliation with the Physical Medicine Section of the Veterans Administration Hospital in Framingham, so that the three years required by the Board may be divided into either two years at the Massachusetts General Hospital and one year at Cushing for those fellowships originated at the Massachusetts General Hospital, or two years at Cushing and one year at the Massachusetts General Hospital for those originated at the Veterans Administration. At the beginning, fellowships were available through a grant by the Baruch Committee on Physical Medicine to the Harvard Medical School for training and research in this field. At the present time, most of the fellows receive stipends from the National Foundation for Infantile Paralysis. To date, there have been five fellows who have completed their full three years of training. Another will do so within six months, and several others have been associated with us for shorter periods of from three months to one and one-half years. Our graduates include one full professor, two assistant professors, and two others with lesser academic rank.

Education: Educational activities, however, have been largely in the training of physical and occupational therapists. The three approved schools for physical therapists and the one for occupational therapists in Boston all send their students for training in our Department. We also have accepted students for affiliation from schools in Virginia, Pennsylvania, New Hampshire, Canada, and occasionally elsewhere. There is still a marked shortage of both physical and occupational therapists and also of physicians specializing in Physical Medicine and Rehabilitation. Therefore, we expect that this aspect of the activities of the Physical Medicine Department will be one of the most important during the coming years, as it has been in the past.

Research: Some clinical research has been done in the Department since its opening, primarily in the field of electrophysiology. Grants have been received from the National Foundation for Infantile Paralysis to study neuromuscular dysfunction in poliomyelitis, and cooperative studies have been made with the Brain Wave Laboratory over a number of years. Other projects have included appraisal of peripheral nerve injuries inflicted in World War II, under the leadership of Dr. James C. White in the Neurosurgical Department, and a cooperative research with the Psychiatric Department on fatigue in psychoneurotic patients, through a grant from the Baruch Committee on Physical Medicine. Other projects have included the study of quantitative methods for measuring muscle strength, using an electronic strain gauge, and the development of progressive resistance exercises, as previously mentioned. Our fellows have also worked on short-time studies which have been reported previously.

In summary, one can say that the past decade has been one of impressive growth in Physical Medicine and Rehabilitation at the Massachusetts General Hospital. We have witnessed the metamorphosis from scattered, unorganized, non-medically directed therapeutic techniques to a Physical Medicine Department with all the activities of an individual medical specialty except a ward service (like Radiology), but including a limited number of private rehabilitation beds. Achievements during this period included diagnostic and therapeutic services to over 25,000 different patients, who received more than 300,000 treatment visits. Clinical training has been given to approximately 800 therapists, and didactic lectures to 500 students. An accepted residency training program has been established, and 13 fellows have received graduate training during the past six years. Research grants totaling nearly $100,000 have made possible the studies of 18 different topics related to Physical Medicine, and 80 medical papers and 2 textbooks have been published.

Arthur L. Watkins, M.D.,
Chief of Physical Medicine

* * *

The following letter has been received from The New York Academy of Sciences:

> It will interest you to know that Joseph C. Aub, M.D. and Henry K. Beecher, M.D. were among the 99 distinguished scientists who were elected to Fellowship in The New York Academy of Sciences on December 5, 1951, at its annual meeting held at the Waldorf-Astoria Hotel in New York City.
>
> Each candidate for this honor was nominated to Fellowship by the Council of the Academy from among the current 6,536 active and sustaining members of The New York Academy of Sciences, in recognition of his outstanding scientific achievements.
>
> The New York Academy of Sciences, organized in 1817, is the fourth oldest scientific society in the United States, and its present membership is located in all forty-eight States, the District of Columbia, and forty foreign countries.

Dr. Henry K. Beecher has been made a Chevalier of the Legion of Honor by Decree of the President of the French Republic. Official notice of the award was transmitted by the French Ambassador, Henri Bonnet, and the presentation was made by the Consul General, M. Chambon.

Dr. Kurt H. Thoma, a member of our Board of Consultation and Professor *Emeritus* of Oral Surgery and Oral Pathology at Harvard Medical School, was awarded the Callahan Memorial Medal in Cleveland, Ohio, last November. The award was made "in recognition of the high merit of scientific contributions made to humanity and the healing professions" by Dr. Thoma.

* * *

OVERSEAS MISSIONS

Dr. Paul D. White left early in January for Pakistan and India, on behalf of the Point IV Program of the State Department. He will spend a short time in Athens *en route*.

Dr. Donald S. King leaves early in February for the Far East for a four-weeks' tour of the Army hospitals in Japan and Korea, as Consultant to the Surgeon General of the U.S. Army.

Dr. Edward F. Bland also leaves in February for a similar visit to the Army hospitals in Germany and Austria, under the auspices of the Surgeon General.

Dr. King and Dr. Bland made similar tours in 1949—Dr. King to the Far East and Dr. Bland to Germany and Austria.

THE NEWS is hoping to receive reports of their findings from these three doctors very soon after their return home.

* * *

The third Edward Pierson Richardson Lecture, in Clinical Science, was given in the Bigelow Amphitheatre on January 21. The speaker was Frank G. Young, M.A., D. Sc., F.R.S., Sir William Dunn Professor of Biochemistry at the University of Cambridge, England. The subject of Professor Young's address was "The anterior pituitary gland and diabetes mellitus".

* * *

STAFF WIVES

Doctors from other countries and their wives were guests at a tea in the Medical Staff Room on January 15.

This was the first of a series of teas to be given by the Staff Wives, who meet the first Wednesday of each month in the Archives Room, Moseley Building. At their January meeting Mrs. Manuel Quijano of Mexico, whose husband is working in the Department of Surgery, received her MGH Volunteer pin from Mrs. Courtney, Chief of our Volunteer Service. Other Staff Wives are enjoying their work in the Volunteer Service.

The February 6 meeting was preceded by a tour of the hospital conducted by Mrs. Weiss, Community Relations Consultant, and lunch in the Nurses' Cafeteria.

All members are urged to be present at the next meeting.

* * *

Contributions totaling $465 were received by THE NEWS during 1951. This figure represents outright gifts, over and above the subscription fee.

A note of thanks is always sent to each such contributor when his gift is received, but THE NEWS takes this opportunity to again thank its many friends for their kind generosity.

The Board of Trustees, at their meetings on December 14 and 28, voted:

To award a Dalton Scholarship to Dr. Carl W. Gottschalk for six months, January 1 through June 30, to pursue studies "pertaining to the measurement of renal interstitial pressure and the factors influencing it";

To grant Dr. George L. Nardi a Dalton Scholarship for one year, effective January 1, to carry out special research;

To accept the resignation of Dr. Arthur S. Keats from the position of Assistant Anesthetist, as of December 17, 1951;

To continue Dr. Thorkild Waino-Andersen as Clinical Fellow in Anesthesia for one year, beginning May 18;

To grant leave of absence to Dr. Paul C. M. Zamecnik, with pay, for approximately one year, from January 1, to pursue special studies.

To appoint:

Professor W. Melville Arnott of Birmingham, England, as Honorary Physician pro tem on his arrival here January 6, for a period of approximately three weeks;

Dr. Joseph L. Braudo as Assistant Resident on the Children's Medical Service for one year, beginning February 1;
Dr. Edward Dunn as Third Assistant Resident in Surgery, beginning July 1;
Dr. Lawrence J. Essember as Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Alexander D. Kenny as Assistant Chemist, to begin on his arrival from England and continue until September 1;
Dr. John D. Leidholt as Assistant Resident in Orthopedic Surgery for one year, beginning January 1;
Dr. Jean Lepoire as Second Assistant Resident in Neurosurgery from January 1 through June 30;
Dr. Clare K. Marshall as Assistant Resident in Neurology for one year, beginning July 1;
Dr. James A. O'Shea as Clinical Associate to the Children's Medical Service;
Dr. George M. Perrin as Intern on the Children's Medical Service for one year, beginning July 1;
Dr. John S. Robey as Intern on the Children's Medical Service for one year, beginning July 1;
Dr. Alfred L. Skinner, Jr. as Intern on the Children's Medical Service for one year, beginning July 1;
Dr. Elizabeth H. Sprague as Intern on the Children's Medical Service for one year, beginning July 1;
Miss Mary M. Sullivan to the Advisory Committee of the School of Nursing, as of January 1.

At their meetings on December 12, 19, and 26, the General Executive Committee voted to promote:

Dr. Thomas C. Peebles from the position of Intern to that of Assistant Resident on the Children's Medical Service, for the period July 1, 1952 through June 30, 1953;
Dr. Paul M. G. St. Aubin to the position of First Assistant Resident in Radiology, effective as of January 1;
Dr. Robert T. Sceery to the position of Chief Resident on the Children's Medical Service, for the period July 1, 1952 through June 30, 1953;
Dr. Stanley C. Ulick from the position of Intern to that of Assistant Resident on the Children's Medical Service, for the period July 1, 1952 through June 30, 1953;
Dr. Chiu-chen Wang to the position of Resident in Radiology, effective as of January 1;
Dr. Richard H. Watson from the position of Intern to that of Assistant Resident on the Children's Medical Service, for the period July 1, 1952 through June 30, 1953.

To reappoint:

Dr. Samuel Brendler as First Assistant Resident in Neurosurgery for the period of one year, beginning January 1;
Dr. Remedios K. Rosales as Resident in Neuropathology for a period of six months, beginning January 1.

To appoint:

Dr. James H. Averill as Clinical Fellow in Medicine, assigned to Cardiology, beginning January 1;
Dr. Vernon G. Bugh as Clinical Fellow in Psychiatry for a period of six months, beginning January 1;
Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, effective as of December 1, 1951;
Dr. Carl F. Essig, Jr. as Clinical Fellow in Neurology for a period of one year, beginning January 1, with the intention of reappointment for a second year.

The General Executive Committee also voted to assign the title Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, to the group of men working with Dr. Edward B. Benedict, who are registered at the Harvard Medical School Postgraduate Course.

ALLERGY CLINIC

In October 1947 an excellent article appeared in THE NEWS, summarizing the history and activities of the Allergy Clinic from its inception. Its author, Dr. Francis M. Rackemann, was the founder of this venture which, in 1919, was one of the first out-patient clinics in this country given over to the study and treatment of allergic disorders. For thirty years Dr. Rackemann guided its destinies and brought this clinic to a point where it not only handled as large a load as 7 percent of all the patients in the O.P.D., but became one of the leading groups of its kind.

Within the past four years Dr. John L. Fromer, Dr. Richard R. Evans, Dr. Irving H. Itkin, and Dr. H. Walter Jones have joined our medical staff. Drs. Jeremiah E. Greene, William B. Clapp, Raymond J. Savignac, Leo B. Burgin, Francis L. Weille, Elizabeth DeBlois, and John W. Irwin—all "old-timers"— complete the medical group. Mrs. Alice Dalrymple and Miss Tyyne Lamsa, R.N., have been faithful clinic helpers. Backed by our clinic secretaries—Mrs. Hannah Robertson, Mrs. Eleanor Tebbetts, and Mrs. Elizabeth Feeley—and assisted by help from Miss Mary J. Graham, they have teamed well with the doctors in enabling the clinic to function efficiently four mornings a week throughout the year.

Innovations in the handling of the clinic include group conferences with patients, permitting the physician to outline to many patients at a time the principles of allergic cleanliness in their homes and to illustrate and discuss with them such details as dust proofing of bedding or self administration of aerosols and of hypodermic subcutaneous epinephrine. An appointment system has been introduced both for patients and for doctors. Surprisingly enough, this seems to be working very well, resulting in increased efficiency for all concerned.

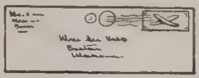
The allergy section of the Medical Service does not consist of the OPD Allergy Clinic alone, but also embraces a well-equipped laboratory situated on the 5th floor of the Domestic Building. Here Miss Graham and, more recently, Miss Priscilla Gordon, make extracts and vaccines for use in the clinic and for such staff members as may require them. An international exchange of technicians has been arranged between our laboratory and that of Dr. A. T. Hansen in Rigshospitalet in Copenhagen. Miss Graham is leaving now to spend a year in Denmark, to learn technical aspects of research in capillary physiology, while Miss Ina Gram-Petersen of their staff joins us in work along similar lines. In our laboratory, also, a research program is carried on by one or more clinical and research fellows as part of their training in allergy. Nine such physicians, so trained in past years, are at present practising this branch of internal medicine in various parts of the U.S. and in Canada. Dr. Wilfred Leith, the most recent of these fellows, held such a position in 1950, coming from and returning to Dr. Bram Rose's clinic in Montreal.

Dr. John W. Irwin, a five-year member of our team, is now working on a U.S. Public Health sponsored grant entitled "Circulatory changes in anaphylactic shock". This study involves direct observation of various mammalian organs, including the liver and lung, by means of the binocular microscope aided by illumination furnished directly to the living tissues through a quartz rod. Circulatory changes in the capillary network of the lung are at present being observed and are being recorded by colored moving pictures.

Recently completed clinical research projects have been described in currently published articles on various topics, such as the effect of ACTH on the immediate type skin test and passive transfer reaction in man, meningitis due to hypersensitivity to pantopaque, and penicillin allergy. A paper now in press on the subject of maintenance cortisone dosage in severe bronchial asthma outlines the results of a one-year attempt to keep such patients symptom free with carefully controlled intramuscular and oral therapy.

During the past two years the Allergy Clinic staff has held a monthly dinner meeting, having as its guests leaders in other specialties and in the basic sciences. This group is not solely interested in the affairs of its own clinic and laboratory, but will welcome opportunities for discussion of related problems by physicians in any department in the hospital.

Walter S. Burrage, M.D.,
Head of Allergy Clinic



New addresses:—

Dr. Randolph L. Anderson (*Or.* 1927), 1208 Kanawha Blvd., Charleston 1, W. Va.
Dr. James H. Averill (*M.* 1947), House of the Good Samaritan, 25 Binney St., Boston, Mass.
Dr. George A. Culver (a.r.p. *An.* 1950), Jefferson Davis Hospital, Houston, Tex.
Lt. Boy Frame, MC, USAF (*M.* 1949), 63d Fighter Interception Squadron, Oscoda Air Force Base, Oscoda, Mich.
Dr. John Homans (*S.S.* 1904), 205 Beacon St., Boston, Mass.
Dr. David Hurwitz (a. *M.*), Wyman House, Mount Auburn Hospital, 330 Mount Auburn St., Cambridge 38, Mass.
Commander William J. James, MC, USN (r.s. *N.S.* 1949), U.S. Naval Hospital, Chelsea, Mass.
Dr. Lewis W. Kane (*W.M.* 1941), 205 Beacon St., Boston, Mass.
Dr. Carroll B. Larson (*Or.* 1938), Children's Hospital, State University of Iowa, Iowa City, Iowa.
Major Roy W. Leeper, MC, USA (r.p. *D.* 1950), TUSAG, JAMMAT, APO 206 A, c/o Postmaster, New York, N. Y.
Dr. Alexander G. Matoltsy (res. assoc. *D.*), Dermatological Laboratory, Massachusetts General Hospital, Fruit St., Boston, Mass.
Dr. John D. Reeves, Jr. (r.p. *R.* 1951), University of Pennsylvania Hospital, Philadelphia, Pa.
Dr. John F. Tannheimer (*M.* 1944), 333½ West Main St., Ionia, Mich.
Dr. Chiu-an Wang (*W.S.* 1944), 306 Sze Hoi Bldg., 12-14 Queen's Road, Central, Hong Kong, China.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. LeRoy A. Schall, Chief of the Oto-Laryngological Service, was a guest speaker at the third Pan-American Congress of Oto-Laryngology and Broncho-Esophagology held in Havana, Cuba, January 20-23. Dr. Schall presented a paper, written jointly with Miss Anita Mangiaracine, Infirmary Bacteriologist, on "The role of antibiotics in treatment of sinusitis". Dr. Schall also gave an instructional course on "Neoplasms of the nose and nasal accessory sinuses".

At the same conference, Dr. George Kelemen, Assistant Surgeon in Oto-Laryngology, presented an instructional course on "Embryonic hearing organs after maternal rubella".

The Board of Managers announce the promotions of Dr. Charles Kent and Dr. Edward F. Lawlor from Assistants in Oto-Laryngology to Assistant Surgeons in the Department.

Dr. Marvin Posner and Dr. Irwin T. Mancall completed their terms of residency on February 1. Dr. Posner will return to Hartford, Connecticut, for private practice and Dr. Mancall will begin private practice in Albany, N. Y.

Some 120 ophthalmological journals have been sent by the Lucien Howe Library to ophthalmologists in Japan. Previously, in the years immediately following World War II, the Howe Library acted as agent for the distribution of wartime American publications on ophthalmology to various foreign centers and investigators.

When information reached the Library last summer that there was a real need in Japan for recent, first-rate ophthalmic literature, Mr. Charles Snyder, the Howe Librarian, placed an appeal for publications in the *American Journal of Ophthalmology.* The cooperative response to this appeal enabled the Library to send over 100 journals to Japan, covering the last five years of the *American Journal of Ophthalmology* and the *A.M.A. Archives of Ophthalmology.*

The literature was sent to the Hiroshima Ophthalmological Society through Dr. Robert M. Sinskey, formerly associated with the Howe Laboratory at the Infirmary and now serving in the armed forces with the Atomic Bomb Casualty Commission in Japan. Dr. Sinskey is the one who first informed the Howe Library of the Japanese specialists' need for recent ophthalmic literature.

Through the New England Ophthalmological Society, the Howe Library is now conducting a second drive for ophthalmic literature, to obtain material that will eventually reach Kurachi, Pakistan.

Dr. Robert R. Trotter, who finished his residency in Ophthalmology last August, has written a very nice letter to The News. He gives as his address SIRI Program, c/o Public Health & Welfare, USCAR, APO 719, c/o Postmaster, San Francisco. His letter reads:

> It was pleasant to receive the September issue of The News. I shall not subscribe now, for my address is anything but permanent. But I am a good potential customer and will be on your list before long.
>
> My efforts are currently directed toward a case-finding survey for trachoma and other eye diseases, principally on Okinawa, but also on Amami Oshima (the northern island with such pronounced wishes to return to Japanese domination), and on Miyako and Yaeyama to the south. In addition to examining the eyes of several thousands of people, a sanitary survey is being carried on coincidentally, to learn some fundamental things about the orientation of the Ryukyuan people toward good sanitation and hygiene. It is hoped that the information obtained will be helpful in planning for education in matters of health.
>
> I find the island beautiful, especially in the north-central and northern regions. November and December are the driest months of the year. The weather is quite crisp (three blankets at night), but the days are lovely and sunny. We pray for drought, for the people do not come to our examining points readily in a good Okinawan rain!

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to The News.

The following new titles have been received:

Allergy

Luce, J. C., Leith, W., and Burrage, W. S.
Pantopaque meningitis due to hypersensitivity.
Radiology 57:878-881.

Anesthesia

Cohen, E. N., and Beecher, H. K.
Narcotics in preanesthetic medication: A controlled study.
J.A.M.A. 147:1664-1668.

Cardiology

Counihan, T. B., Rappaport, M. B., and Sprague, H. B.
Physiologic and physical factors that govern the clinical appreciation of cardiac thrills.
Circulation 4:716-728.

Dermatology

Lever, W. F.
Pemphigus: A histopathologic study.
A.M.A. Arch. Dermat. & Syph. 64:727-753.

General Medicine

Harwood, R.
Diabetic acidosis: Results of treatment in 67 consecutive cases.
New England J. Med. 245:1-9.

Neurology, Neurosurgery, and Psychiatry

Bakay, L., Selverstone, B., and Sweet, W. H.
Intravascular distribution of Na^{24} injected intravenously in man.
J. Lab. & Clin. Med. 38:893-903.

Brown, M. R.
"Wetherbee Ail"—The inheritance of progressive muscular atrophy as a dominant trait in two New England families.
New England J. Med. 245:645-647.

Miles, H. H. W., and Cobb, S.
Neurocirculatory asthenia, anxiety and neurosis.
New England J. Med. 245:711-719.

Verzeano, M.
Time patterns of speech in normal subjects. II
J. Speech & Hearing Disorders 16:346-350.

Viets, H. R., and Brown, M. R.
Medical progress: Diseases of muscles.
New England J. Med. 245:647-653.

Surgery—Reconstructive

Weisman, P. A., and Cannon, B.
The failure of heat treatments to prolong the survival of skin homografts in guinea pigs: A pilot experiment.
Plast. & Reconstruct. Surg. 8:428-429.

Weisman, P. A., Wight, A., Quinby, W. C., Jr., and Cannon, B.
The failure of adrenal cortical hormones to prolong the survival of homologous skin grafts.
Plast. & Reconstruct. Surg. 8:417-427.

* * *

THE GET-ACQUAINTED DEPARTMENT

In our January issue we made an appeal to all doctors who are here from countries outside the United States, to tell us something about their personal experiences in their home lands and, in a general way, to give us a comparison, as they find it, between the practice of medicine and surgery as it is carried on here in the U.S. and methods and procedures in effect in their own countries. We are hoping for many responses to our appeal, in time for the next issue of The News.

But there is no reason why this request should be limited to this one particular group. We came to that conclusion the other day during a conversation with Dr. Nathan E. Silbert, Clinical Fellow and Graduate Student Assistant in Dermatology on our staff. Dr. Silbert had come to our office to subscribe to The News and here is what came out, quite inadvertantly, during our brief talk:

Dr. Silbert was born in a house at the corner of North Anderson and Fruit Streets. "Even as an infant," he said, "one of the first things I ever saw was the old Bulfinch Building."

After graduating from Revere High School in 1926, Tufts Premedical School in 1928, and Kansas City University College of Physicians and Surgeons in 1933, Dr. Silbert practised medicine in Somerville until 1941. In 1942 he joined the Army Medical Corps, served under General Patton in the Third U.S. Army, and was discharged as Major in 1946. On return from overseas, he spent 14 months on the Allergy Service here at the General and then reopened his office in 1947 for the practice of medicine, limited to allergic diseases, at 214 Ocean Street, Lynn. "Since 1948 I have been carrying on clinical research in the treatment of allergic disorders with massive doses of vitamin C and sodium ascorbate, particularly in the symptomatic treatment of bronchial asthma where the benefits derived by massive doses of vitamin C have more than justified the continued use of this therapy," he said. In September of 1951 he addressed the First International Congress of Allergists at their meeting in Zurich, Switzerland, and delivered a paper on "Vitamin C, its sodium salt, in a new physiologic approach in the symptomatic treatment of asthma, seasonal and perennial allergic vasomotor rhinitis". While in Europe he visited many of the leading allergists and leading allergy clinics. On January 21 he addressed the Third Pan-American Congress of Oto-Rhino-Laryngologists in Havana, and in April he is to read a paper at the Annual Meeting of the American College of Allergists. Dr. Silbert is the author of many published articles dealing with his specialty.

At our request, Dr. Silbert sent us the following excerpt from his address delivered at the Pan-American Congress in January:

Phenergan Hydrochloride, a phenothiazine derivative, and one of the most potent antihistamines known at the present time, is a compound of high potency, with powerful pharmacologic action and more prolonged effect than most of the histamine antagonists in common use.

The primary aim in the therapy of allergic disease is to either remove the causative sensitizing agent or allergens from the patient's environment or daily routine, or to proceed with desensitization techniques which will give substantial immunity to the offending allergens. This aim is not always immediately possible or practical, but until such time as desensitization therapy is feasible the patient deserves our every effort toward symptomatic relief. To date, the best symptomatic relief for these patients has been obtained with antihistamine drugs. In every instance possible in this series, desensitization therapy was carried out concomitantly with antihistamine therapy. Phenergan Hydrochloride produced relief of symptoms in practically all cases within one-half hour and could be maintained indefinitely on continuous dosage. A single dose of Phenergan was found to maintain symptomatic relief from a minimum of four hours to a maximum of twenty-four hours. No other antihistamine in our experience has exhibited such prolonged action.

Phenergan Hydrochloride is a highly effective antihistamine. Its action is rapid in onset and its beneficial effects are often maintained from four to twenty-four hours from a single dose. In a series of 216 cases which we studied, 88.42% of the patients received relatively good lasting symptomatic relief during which time definitive therapy could be started. Its unusual effectiveness combined with its low order of toxicity gives Phenergan Hydrochloride a definite place in the armamentarium of the physician.

* * *

Here is a list of some of the special items of equipment now being used in the new Research Building:

METTLER "GRAMATIC" BALANCE Room 506

The Mettler "gramatic" balance is the latest development in instruments for quick and easy weighing of small objects. In contrast to the conventional type, this balance has only one pan, and all weights are added or removed automatically by turning dials on the front of the case. The final accurate weight is read directly on an illuminated scale. A difference of two one-hundredths of a milligram (about one-millionth of an ounce) can be detected.

COUNTERCURRENT DISTRIBUTION Room 508

At the Rockefeller Institute for Medical Research, Dr. Lyman Craig has developed a powerful method for separating natural products, which are often sensitive and delicate and must be handled very gently. The procedure, known as countercurrent distribution, employs thousands of individual extractions with chemical solvents, and two types of apparatus have been devised for carrying it out. One is made of stainless steel and the other largely of glass.

SEPARATION COLUMN Room 401

This is a device whereby amino acids can be separated. The relative proportions occurring in proteins can thus be determined. A mixture of amino acids obtained from a protein is placed on the top of the starch column and the amino acids migrate down through the starch at varying rates, so that they come out as separate individuals on the bottom of the column. There is an automatic drop counter which determines how many drops will go into each test tube before the turntable moves on to the next tube.

AUTOMATIC SCALER Room 401

This is a device for counting and recording the amount of radioactivity in series of samples in an automatic way which saves the time of one person. It is possible for the investigator to load up the sample changer with 24 samples at night and find the answers all printed out for him in the morning.

ROTATING STILL Room 417

The rotating still is used in the preparation of concentrated solutions of hormones. It has the advantage that evaporation of solvents takes place rapidly because of the continual exposure of fresh surfaces, both at the heated and cool ends of the still. For this reason concentration may be carried out at relatively low temperature, thus avoiding the damaging effects of heat on the more sensitive hormones.

LYOPHILIZER Room 417

This apparatus is used for the simultaneous evaporation of 26 samples of hormone solutions from the frozen state. These solutions are placed in the small flasks and immersed in the freezing bath. When freezing is completed, the vacuum pump is started and evaporation commences. The solvent vapors are caught in the 2 large traps which are maintained at -70°C. This apparatus permits the concentration of a large number of samples under very mild conditions.

WARING BLENDER Room 319

A unique adjunct to the biochemists' ever-expanding armamentarium is the Waring blender. This clever device, now as commonplace in the research laboratory as the egg beater in the kitchen, is the rather frivolous invention of a well-known interpreter of popular song, Fred Waring, who disguised it as an accessory to bartending. In the laboratory it serves to break tissues down into their finest components, making even the most minute particles accessible to the searching analyses of modern biochemistry.

PHASE MICROSCOPE Room 318

Living cells have, in general, little or no natural color, and relatively little internal detail can be seen with the ordinary microscope. Because of this, technique of fixation and staining came into use in cytology and histology. The phase microscope employs a unique optical device whereby differences in refractive index become translated into shades of gray; thus uncolored structures within living or fixed cells which differ in refractive index become clearly visible.

BECKMAN SPECTROPHOTOMETER Room 317

All chemical compounds will interact with radiation in a number of ways. One of these is the absorption of radiation. The Beckman spectrophotometer is one of the instruments available which is designed to measure the absorption of radiation in the visible and ultraviolet portion of the spectrum. The determination of shape of the absorption affords a clue as to the nature of the absorbing molecules and if this is already known then the amount of absorption can be used to calculate the amount of the compound present. This method is characterized by high sensitivity and relative simplicity.

ELECTRON MICROSCOPE Room 217

This instrument is used to study the structure of materials whose units are too small to be resolved by the light microscope. These include biological objects such as viruses, minute structures in cells, large protein molecules, and organized groups of such molecules as in muscle and tendon. It can also be very effectively used in the study of physical chemical reactions between large molecules as in the formation of fibers such as collagen. The electron microscope has a resolving power about 1000 times greater than the light microscope and magnifications of 300,000 times are feasible—in contrast to a maximum of about 2000 times for the ordinary microscope.

SPINCA PREPARATIVE ULTRACENTRIFUGE Room 217

This instrument serves in the preparation of materials for further chemical or physical analysis by permitting the separation of extremely small particles from a fine suspension. The rotor in use at present can handle 162 cc. and does not require balancing of the specimen tubes. The speed is easily regulated between 0 and 40,000 revolutions per minute, producing a maximum centrifugal force of 144,700 times gravity. The instrument is refrigerated, and the rotor runs in a vacuum to reduce friction. The entire operation is automatic. Speed and time of operation are set beforehand on dials, and acceleration and braking are performed automatically.

TREADMILL Room 125

This electrically driven treadmill has been used for the purpose of studying muscular and nervous exhaustion. It permits a man to walk or run at an absolutely constant rate, either on the level or uphill. It can be used to study breathing and oxygen utilization during exertion and can be used to study and

No. 35 in a series of Staff photographs
Dr. Raymond D. Adams, Chief of Neurological Service

test nervous and muscular fitness of sick and well subjects.

"HOT" LABORATORY

The "hot" laboratory is designed for the handling of large quantities of radioactive material. Three hoods of special design—air filters, lead shielding in base, and external controls—are available for radioactive work. All laboratory benches have stainless steel tops and the hot sink is of stainless steel. Three lead safes are available for the storage of radioactive material.

BIOGLETS

Dr. Leon I. Charash, Assistant Resident on the Children's Medical Service — born in Irvington, New Jersey, September 12, 1927; B.A., Cornell University, 1946; M.D., Cornell Medical College, 1950; Intern, Bellevue Hospital, New York City; home, Irvington, New Jersey.

Dr. John O. Esslinger, Assistant Resident in Orthopedics — born in Fulton, Missouri, January 2, 1925; M.D., St. Louis University Medical School, 1948; undergraduate work, Westminster College and Yale University; Intern and one year as Graduate Assistant Resident in General Surgery, Grace Hospital, Detroit, Michigan; one year as Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, Massachusetts.

Dr. Hans J. Harder, Assistant Resident in Anesthesia — born in Wilhelmshaven, northwest coast of Germany; Friedrich-Wilhelm University, Berlin, and Rupprecht-Carl University, Heidelberg, 1938-44, with Army service in Russia, 1941-45; Prisoner of War in Germany, 1945-47; Surgery, Rudolf Virchow Hospital, West Berlin, 1948-50; Anesthesia, since 1950.

Dr. Rhett Talbert, Assistant Resident in Neurology – born in Greenwood, South Carolina, March 30, 1921; grade school education, Allendale, South Carolina; A.B., Wofford College, Spartanburg, South Carolina, 1942; M.D., Medical College of the State of South Carolina, 1945; Intern, Medical College of Virginia Hospital, Richmond, Virginia, 1945-46; U. S. Army: Medical Corps, Fort Sam Houston, Texas, and Lowry Field, Denver, Colorado, 1946-48; discharged with rank of Captain; Resident in Internal Medicine, Medical College of Virginia, 1948-51, during which period, in addition to clinical service, worked with the Department of Oncology in thyroid diseases, with radioactive isotopes; basic course in use of radioactive isotopes, Oak Ridge, Tennessee, January 1950; home: Allendale, South Carolina; married; one son, age 6 months.

Brief bits:—

- Dr. Bradford Cannon, Associate Visiting Surgeon on our staff, spoke at the Warren, Ohio, Medical Society recently. His subject was "Some recent advances in Plastic Surgery".
- Dr. Stanley T. Soholt (sr. r.s. *Or.* 1951) announces the opening of his office at 115 Duane St., Redwood City, California, for the practice of Orthopedic Surgery.

Mr. Hamilton, the efficient custodian of our Parkman Street parking lot, gives a prize each year to the person he regards as having done the best job of careful and considerate parking during the preceding twelve months. This year the prize—a box of candy—went to Dr. Helen S. Pittman, Associate Physician on our staff.

A write-up announcing the award, together with a picture of Mr. Hamilton and his comments on the comparison between men and women parkers appeared recently in one of our local newspapers.

* * *

STORROW HOUSE

Every time we stop at Storrow House, the MGH convalescent unit in Lincoln, on an errand which we think will take no more than a few minutes' time, we end up by staying the entire day. The beauty and atmosphere of the house and its surroundings, both natural and man-made, conspire to make it very difficult for one to get away; and the conversations with the patients at the dinner table out there, in the living room, or on chance meetings about the grounds are not only highly interesting but are of such a quality that the talks are not to be soon forgotten. For instance, on one of our recent visits we found among the patients a padre, a colonel from Guatemala, a cheese manufacturer from Denmark, a 28-year-old surgeon from South America, a retired sea captain, three people from Iceland, and others from Switzerland, British Columbia, Sweden, the Philippines, Barbados, Texas, and New York. All these on one visit, alone. This group, at the dinner table, suggested a United Nations assembly.

Whether you are convalescing, in need of a rest, or just "want to get away from it all"—or if you know anyone in need of such—we recommend most highly and without reservations our Storrow House in Lincoln. Once you see the place you will understand our enthusiasm.

An air-view photograph of Storrow House and its environs is on the bulletin board near the foot of Treadwell stairs. A booklet containing information and pictures may be procured from the Director's Office, and arrangements for admissions may be made through the General Hospital Admitting Office.

The spring of the year is particularly lovely out there. The trails through the woods, with sprinklings of wild spring flowers under the trees, are a veritable panacea. We have too long failed to keep that promise we made to ourselves—a week end at Storrow House.

THE NEWS

No. 110 Boston, Mass. March 1952

PSYCHIATRIC SERVICE AFFAIRS

The detailed reports from the various subdivisions of the Psychiatric Service show that this past year has run along at much the same pace as the previous three years. The wards B7 and B8 have been full most of the time and there has usually been a waiting list. In the Out-Patient Department, we have had to refuse many patients because there are not enough psychiatrists to carry out therapy on all the patients who need it. Therefore, many patients had to be satisfied with brief advice. It must be frankly admitted that for some there is no solution to their problems because of the social, economic, and psychological situations. For others, occasional visits for advice and encouragement are of supportive value, and help the family physician to carry these patients along for years.

Teaching activities have been expanded by the addition to the clinic staff of Dr. Elizabeth Zetzel, who visits the clinic on Monday and Thursday afternoons as a consultant in psychotherapy. Under her impetus a new emphasis has been placed upon the evaluation of new patients, diagnostically and therapeutically, at the initial interview.

The admissions to the Psychiatric Service (as shown in Table I) are mostly patients from the Psychiatric Out-Patient or from the medical wards of the General Hospital, where their symptoms have been diagnosed as neurotic. A few psychotic patients come to the service, either as emergency problems from the Emergency Ward or as diagnostic problems. As soon as a diagnosis can be made and when the emergency is over, these patients are transferred to an appropriate institution. The psychotic problems numbered 16, as opposed to 117 neurotic and psychosomatic problems. A glance at the list of patients boarded on B8 (Table II) shows that this small ward has been even more active than last year. It has taken a great burden off the other wards in terms of disturbed patients, difficult nursing, and risk of accident. For a hospital of this size, the disturbed ward for psychiatric emergencies should have eight or ten beds rather than the four (sometimes five) that we now have.

A new development has been a special clinic for alcoholic patients in the Out-Patient, directed by Dr. Volta R. Hall, with a consulting service in the General Hospital under Dr. Leon Miller, a Clinical Fellow who sees the patients, works up the cases, and consults with Dr. Hall about referral and treatment. This service for patients suffering from alcoholism has long been needed. It is beginning in a conservative way, because it is desirable to keep it a service for Massachusetts General Hospital patients and for selected referrals from various agencies. If it were thrown open to all comers, we would be overwhelmed. With the financial help of the Commonwealth of Massachusetts, it is making a good start.

The Psychiatric Service for Children

This work is directed by Dr. Lucie J. Jessner, as a cooperative enterprise of the Psychiatric and Children's Medical Services. It is growing rapidly and has overflowed its allotment of space. Fortunately, new quarters are now being built, so this active unit can continue to grow and fulfill the great need for child psychiatry in the community, and the even greater need for training child psychiatrists to go to other parts of the country.

The figures for the year give an idea of the activity:

Intake applications	250
Cases seen for diagnosis and consultation (waiting list about 50)	200
Cases seen for psychological testing	165
New cases accepted for treatment	72
Total cases being treated	188

The fact that patients on the waiting list often have to wait over three months before they can be studied and that only about one-quarter of them can be accepted for treatment shows the need for expansion.

Many cases of psychosomatic disorder are seen (allergy 19, arthritis 8, colitis 3, peptic ulcer 3). Disturbances in growth and development are an especial interest (22 cases). Neurotic reactions are common, and psychoses are rare (2 cases of schizophrenia). Feeding, training, and learning difficulties are often treated (21 cases).

The patients come largely from Massachusetts (93 percent) and 85 percent are first seen in the Children's Medical Department. The psychiatrists and pediatricians who come to the unit for training are from many of our States, as well as from Finland, Israel, and Australia. In all, 15 physicians have received training this past year. They have been sent here by the U.S. Public Health Service, the Veterans Administration, the Rockefeller Foundation, and various smaller organizations.

The research activities of the members of the Psychiatric Service for Children center around: (1) the study of the conflicts, fears, and fantasies of children with psychosomatic disorders; (2) the psychological effects of hospitalization and surgical operation upon children; (3) the effects of disabilities, such as blindness and restriction of activity because of rheumatic heart disease, upon children's psychological development.

Psychiatric Research

1. Language in manic patients: This is a piece of work that has been under way for two years and was reported at the meetings of the American Neurological Association last June. The research has been done by Drs. Lorenz, Cobb, and Waldfogel, and Mr. Johnson. The more mathematical parts of the language analysis will be presented in a paper in which they will be combined with the results from patients with leukotomy and gyrectomy.

2. Language before and after leukotomy: This research is being carried on with Dr. J. C. White and his neurosurgical associates, and by Drs. Bonner, Cobb, and Waldfogel, and Mr. Johnson. A paper was presented in December at the meetings of the Association for Research in Nervous and Mental Disease, in New York. This work is closely integrated with #3 and #4, below.

3. Behavior before and after orbital gyrectomy: This is a project carried on primarily by Drs. William H. Sweet of the Neurosurgical Service and Frances J. Bonner of the Psychiatric Service, on a grant from the U. S. Public Health Service. The behavior of these patients is studied by a complex battery of psychological tests and by special examinations of their language. Dr. Waldfogel is doing a large part of the psychological studies. Mrs. Edna Barrabee is carrying on a sociological study.

4. Psychological study of patients with intractable pain: This work is being done largely by Drs. Bonner, Waldfogel, and Cobb. The study includes patients from #2 and #3, above, but is a more general investigation aimed at learning the relationship of pain and suffering, not only to the patient's lesion, but to his whole personality. In this is included the effect of psychotherapy on patients with severe and prolonged pain, in order to find out how many of them may be relieved by psychotherapy and thus spared neurosurgical operation or withheld from surgical intervention because of personality difficulties that might lead to postoperative psychosis or behavior trouble.

5. Psychological effects of ACTH and cortisone: This is an investigation being carried out by Drs. Lincoln D. Clark and Gardner C. Quarton, in cooperation with Dr. Bauer. A preliminary report was read last January and will appear shortly in the New England Journal of Medicine. The work is being enlarged and Dr. Albright's group is being brought into it.

They have cooperated especially in our investigation of the mental aspects of Addison's disease. The main work is to record the medical and psychiatric changes seen in patients after the use of these hormones, with special attention paid to those who become psychotic for brief or longer periods.

6. Psychosomatic studies: These are being carried out along the general pattern of comparing the medical examinations of a given group of patients with the data from interviews and a battery of psychological tests. Conditions under special study at present are:

- A. Coronary thrombosis in middle-aged males (Drs. Miles and Waldfogel)
- B. Rheumatic fever (Drs. Holder, Brazelton, and Waldfogel)
- C. Asthma (Drs. Coolidge, Jessner, and Miller)
- D. Children's reactions to operation and hospitalization (Drs. Jessner, Blom, Miller, and Waldfogel)
- E. Thyroid disorders (Drs. Quarton and Stanbury)
- F. Low back pain in relation to orthopedic surgery (Drs. Barr, Barry, and Nemiah)
- G. Rheumatoid arthritis (Drs. Blom and Miller, and Miss Nichols)
- H. Ulcerative colitis (Drs. Blom and Jessner)

7. Study of the factor of conscious control in neurotic and psychotic patients: This is in connection with tests involving conflicting stimuli being carried on by Dr. Waldfogel; preliminary work has already been done and is encouraging.

8. Psychiatric study of blind children suffering from retrolental fibroplasia: Work being done in connection with the Massachusetts Eye and Ear Infirmary and the Perkins Institution for the Blind, on a group of 300 children with this disorder; a study is being made of rehabilitation by means of improving their contact with the world and with key persons in their environment (Dr. Jane Hallenbeck).

Stanley Cobb, M.D.,
Chief of Service

Table I

Patients discharged from the Psychiatric Service — 1951

1.	Hysteria	32
2.	Depression	20
3.	Anxiety state	11
4.	Mixed psychoneurosis	9
5.	Behavior disorders	16
6.	Addiction problems	10
7.	Obsessive-compulsive neurosis	7
8.	Tic	3
9.	Psychosomatic reaction (asthma 1, colitis 2, dermatitis 2, others 2)	7
10.	Hypochondriasis	2
11.	Schizophrenic reaction	9
12.	Manic reaction	2
13.	Epilepsy	7
14.	Alcoholic psychosis	3
15.	Cerebral arteriosclerosis	2
16.	Cerebral tumor	1
17.	Intractable pain	15
18.	Diagnosis deferred	2
	Total	158

Table II

Patients from other Services, boarded on B8

1.	Toxic conditions (delirium, alcohol, barbiturate, etc.)	20
2.	Suicidal attempt	17
3.	Manic-depressive reaction (manic 2)	11
4.	Schizophrenic reaction	29
5.	Psychoneurosis	20
6.	Reactions related to endocrine disorders (ACTH 1, cortisone 5, Cushings's syndrome 3)	9
7.	Psychosomatic reactions (asthma 1, hypertension 4, peptic ulcer 1)	6
8.	Senile dementia	5

The Vincent Club presents
"The 1952 Vincent Show"

for the benefit of The Vincent Memorial Hospital, Wednesday, March 26 – Saturday, March 29, at New England Mutual Hall, 225 Clarendon Street, Boston.

Evenings at 8:30. Saturday matinee at 2:30.

Tickets on sale beginning Monday, March 10, at the box office, New England Mutual Hall.

This is The Vincent Club's sixtieth Anniversary, so come — have fun — and help us celebrate!

On the recommendation of the Hospital Committee of the Trustees, the Board of Trustees, on December 28, 1951, voted:

1. That the retiring age for a full-time physician who does not hold a tenure appointment at Harvard will be June 30th following his sixty-sixth birthday, in conformity with the Harvard Medical School and Massachusetts General Hospital rule for full-time Harvard appointees.

2. That there be created seven positions in the Hospital in which tenure of office would be guaranteed, under conditions similar to those governing the tenure appointments at the Medical School*, until retirement age. The seven positions recommended are:

One Pathologist other than the Chief (The Chief of Pathology has tenure under the Harvard system.)
One Clinical Pathologist
The Chief of Radiology
One Radiologist other than the Chief, to be Executive Officer of the Department
One Radiologist other than the Chief, for therapy
One Anesthetist other than the Chief, to be Executive Officer of the Department (The Chief of Anesthesia holds tenure by virtue of the Harvard system.)
One Assistant Director

3. That, in contra-distinction to the Harvard system, other full-time men in these Departments might continue to be employed by the Hospital after eleven years of service, even until retirement age, but without guarantee of tenure.

4. That candidates for these seven tenure positions should be considered by an ad hoc committee appointed by the General Executive Committee to report recommendations to the General Executive Committee, which, in turn, would recommend candidates to the Board of Trustees.

The Board of Trustees, at their meetings on January 11 and 25, and February 6, voted:

To accept the resignation of Mr. Raymond S. Quick from the position of Assistant Physicist;
To change Dr. Patricia H. Benedict's title from Assistant in Gynecology to Assistant in Medicine;
To continue the appointment of Dr. H. Eugene Patterson as Assistant Resident on the Children's Medical Service from October 15, 1951, to February 15, 1952.

To appoint:

Dr. Allan L. Friedlich, Jr. as Assistant in Medicine, effective immediately, and to permit him to see a limited number of private patients at the Hospital;
Dr. Martin L. Guzman, Jr. as Administrative Resident, beginning February 11;
Dr. Raymond A. Giusti as Second Assistant Resident in Pathology for one year, beginning July 1;
Dr. Marianne R. Johnson as Assistant Anesthetist, to begin about April 1;
Dr. David Kahn as Assistant Pathologist, to begin July 1;
Dr. Winfield S. Morgan, III, as Assistant in Pathology to July 1;
Dr. George L. Nardi as Assistant in Surgery, as of January 1;
Dr. Alexander C. Ritchie as Second Assistant Resident in Pathology for one year, beginning September 1;
Dr. Edgar B. Taft as Assistant Pathologist, beginning July 1;
Dr. John B. Tallon as Second Assistant Resident in Radiology, to begin July 1;
Dr. William R. Waddell as Assistant in Surgery, as of January 1;
Dr. Howard S. Yaffee as Assistant Resident in Dermatology, beginning July 1.

At their meetings held during January, the General Executive Committee voted:

To promote Dr. Crawford S. Brown to the position of First Assistant Resident in Dermatology, effective as of July 1;
To promote Dr. Fa-Chi Dunn to the position of First Assistant Resident in Dermatology, effective as of July 1;
That Dr. John S. Bray's title of Graduate Student Assistant be changed to that of Clinical Fellow in Medicine, assigned to Cardiology, for the period beginning February 1 and ending September 30.

To appoint:

Dr. John R. Brooks as Clinical Assistant in Surgery, to assist Dr. Leland S. McKittrick, effective as of January 1;
Dr. Philip R. Dodge as Research Fellow in Neuropathology for one year, beginning July 1;
Dr. Louis R. Eicholz as Research Fellow in Surgery, for the period February 1 through

---

*To be presented in detail at a later meeting.

June 30;

- Dr. Sanford T. Freedman as Clinical Assistant in Orthopedic Surgery, effective as of January 1;
- Dr. Anne F. Godley as Clinical Assistant in Medicine, effective as of January 16;
- Dr. Francisco J. S. Lara as Research Fellow in Biochemistry for one year, beginning January 2;
- Dr. Anne R. O'Donnell as Clinical Assistant in Radiology, effective March 1;
- Dr. Winston S. Rickards as Clinical Fellow in Psychiatry for one year;
- Dr. George P. Vryonis as Graduate Student Assistant in Pathology, for the period January 1 through February 29;
- Dr. Earle W. Wilkins, Jr. as Clinical Assistant in Surgery, to assist Dr. Richard H. Sweet, effective as of January 1;
- Dr. Robert S. Wren as Clinical and Research Fellow in Orthopedic Surgery, for the period January 1 through January 31.

DIABETES CLINIC

Diabetes occupies a rather unique position among the chronic diseases. For one thing, it is at present incurable; for another, it is affected by almost every act and event in the life of its victim. Serious complications in seemingly remote systems of the body may develop with dramatic suddenness or may appear and progress insidiously over a period of years. Since the discovery of insulin in 1921, there have been no major changes in the treatment of diabetes, although some refinements have been developed and the natural history of the disease is more fully appreciated. During the last decade two important features of diabetes have been recognized. The first of these is its prevalence: an estimated 1,000,000 cases under treatment in this country, and an estimated 1,000,000 cases whose diabetes has not yet been detected. This latter group, ¾ of 1% of our population, presents a tremendous challenge to the medical profession—a million persons, most of them symptom-free at present, who in the next ten years will come to us for treatment of serious disease. Another important fact seems now well established: The incidence of many of the serious complications of diabetes—not only diabetic acidosis and insulin shock, but also infections, diseases of the eyes, the peripheral nerves, the kidneys, and even degenerative vascular diseases—is much reduced by meticulous control of the blood sugar. My own experience in this field has led me to the belief that a large majority of diabetics—perhaps 80% of them—fall far short of meticulous control, and that there are two main reasons for this: There is the patient himself, who is ignorant of, or indifferent to, the future, and whose appetites and social customs, plus the general stresses of everyday life, quite overwhelm whatever tendency he has toward control of his disease. And there is the busy practitioner, too preoccupied with the problems of acute illness to pay more than scant attention to the patient who, though seemingly quite well, shows "a trace of sugar". The doctor, moreover, often freely admits that he feels unsure of himself in treating diabetes; he is a little vague about diet prescription, and unduly afraid of giving adequate doses of insulin. For many reasons, then, both patient and doctor tend to remain complacent about the state of mediocre control—until irreversible and crippling complications finally appear. We are confident that the attitude of the patient will change for the better with our perseverance, as it has in many other diseases. Much depends upon the practitioner, who must first become convinced that adequate control is an important measure in preventive medicine, and that only a slight additional effort is needed to achieve it.

Let us turn now to a consideration of some of these problems as they apply to the Diabetes Clinic of the M.G.H. Our clinic has the responsibility of caring for the diabetes of perhaps 1,000 persons, and we estimate that around 2,500 clinic visits are made annually. Most of the patients have been followed for several years, and a few have been faithful attendants for 20 years or more. The Diabetes Clinic means a great deal to these patients: it is where they know they can get expert advice, and where they ruefully confess that they have not followed it. They look to us for help in other matters, too: emotional crises, financial problems, and a wide variety of medical and surgical disorders. The bond that develops between doctor and patient through long association makes us feel that we are a Special Clinic in more than one sense.

One particular problem of the Diabetes Clinic is the patient's need to have access to the doctor at other times than during clinic hours. When complications develop between visits, he should be able to contact the hospital and obtain the advice of the doctor most familiar with his case. A service of this sort was for a long time available to our patients. It was discontinued about a year ago, over my vigorous protest, but I am convinced that it had great value in forestalling catastrophic illness, and it is my earnest hope that we can soon re-establish such an important feature of our program.

Another special problem has been constantly with us since just after Pearl Harbor. We are understaffed. One or two visiting physicians, and one or two house officers, attempt to take care of the many problems of 20 to 30 patients in an afternoon. Occasionally 40 to 50 patients appear for treatment. On days when the doctors are few in number, or the roster of patients is unusually large, we cannot possibly do an adequate job with each patient. We would welcome additional recruits to our clinic, and we feel that they would find the experience gained there extremely valuable. We feel, too, that the teaching potentialities of our clinic are not being fully utilized. In the Nutrition Clinic, right across the corridor from us, Miss Chase and her assistants would gladly teach any interested physician or medical student all that he needs to know about diets for diabetics. The physicians in the Diabetes Clinic (Dr. John Homans, Jr., Dr. H. Walter Jones, and I) would also welcome any visitors, and would be glad to give informal instruction from our large group of interesting cases. The clinic meets on Tuesday and Friday afternoons. Come up and see us some time!

Reed Harwood, M.D.,
Head of Diabetes Clinic

* * *

When I was told that I might write "anything I wished to" for publication in THE NEWS, my reaction was, "Hot dog! I'll sound off on that mass exodus of hospital personnel, known as 'The Coffee Hour'." I finally abandoned that idea, however, when I realized that I might start a chain reaction leading to eventual collapse of the entire staff and possible interruption of hospital service to hundreds, perhaps thousands, of patients. The consequences of withholding morning nourishment would undoubtedly take its toll and many would drop by the wayside; others would be psychically traumatized at the prospect of three hours of uninterrupted labor; but by far the most devastating effect would be a latent and slow dissolution of our forces when such a large group of people would be forced to rise one hour earlier in order to eat breakfast. Sleep, we know, is essential, and I shudder to think of the result of depriving people of the essentials of life. There are laws forbidding it. Deprivation, plus the withdrawal of the stimulation of morning coffee, would be too much. All this serves as a proper introduction to the subject of nutrition but has nothing to do with what follows, except to inform you as to what I am not going to say.

It has been suggested that many might be interested in something about a clinical research program concerning the use of emulsified fat intravenously for caloric supplementation that is being carried out on the wards of the hospital. There are several general features of this work that are of interest. First, it is a cooperative effort between the house staff of the hospital and the Department of Nutrition of the Harvard School of Public Health. Second, the clinical trial of a new preparation of this sort, as we have used it, carries with it the knowledge of its immediate usefulness to the patients who receive it. Third, the clinical application of this means of intravenous feeding is a first-class example of the fruition of basic research.

The fat project started almost 10 years ago and has gradually become one of the principal investigational programs of the Department of Nutrition. This work has been carried out by two dozen or more investigators, under the direction of Dr. Frederick Stare. The project arose and has been sustained by the recognition that there is quite a large and increasing number of patients who need more calories than we have previously been able to give by the intravenous route. Our wards contain many patients who cannot eat. There are patients for whom utilization of orally ingested food is unsatisfactory, as for example in cases of severe diarrhea, ulcerative colitis, sprue, and patients with intestinal fistulae. There are patients in whom oral ingestion of food is deleterious and rest of the gastrointestinal tract is desirable. There are also patients for whom the time for correction of nutritional deficiency is limited, for example in preparation for surgery. And, finally, there is a group of patients for whom caloric intake is important to prevent destruction of body protein and the accumulation of nitrogenous waste products, as for example in uremia.

The intravenous administration of water, electrolytes, glucose, protein hydrolysates, amino acids, blood and its derivatives, and the water-soluble vitamins constitute a remarkable group of materials that can be presented to the body for its metabolic needs. They fall short in one main regard. They do not supply enough calories. This defect arises from the fact that both proteins and carbohydrates yield only 4 calories per gram and neither substance can be infused in concentrations of more than 5 to 10 percent. They are thus limited by the quantity of fluid a patient can tolerate. From a practical standpoint, adequate total parenteral nutrition seems impossible unless sufficient calories can be given. The chief advantage of the use of fat in parenteral nutrition resides in its contribution to the energy intake. Since oil-in-water emulsions do not exert any osmotic effects, high concentrations of fat may be used. This, coupled with the high caloric content of fat, makes it possible to introduce considerable quantities of energy into relatively small volumes of intravenous mixture. Fat is not irritating to the veins and is not excreted by the kidneys, regardless of the rate at which it is administered.

The work on intravenous fats has been concerned with two broad aspects of the problem. First, the preparation of emulsions suitable for intravenous administration and, second, the utilization of such fat. Emulsions have been prepared with various types of homogenizers and with sonation. The high-pressure dairy homogenizer has given the best emulsions. The homogenizer is used at pressures ranging from 2500 to 5000 pounds per square inch and produces an emulsion with particle size below one micron, which, so far as can be told, is quite comparable to chylomicrons. One of the principal problems has been stabilization. This is difficult under ordinary conditions and becomes more so because of the extra "breaking" impetus of sterilization by autoclaving. Although sterile emulsions can be prepared without autoclaving, it has seemed that stable preparations that can be autoclaved needed to be attained before this form of therapy could be widely applied. These difficulties are pretty much past history now, for the emulsions prepared during the past year and a half have been unquestionably stable for long periods of storage and during transportation.

The workers at the Medical School tested a large number of emulsifiers, stabilizers, and wetting agents long before "clinical emulsions" were even considered. A phospholipid preparation obtained from soy beans has been most useful. It is nontoxic in low concentrations when properly purified. This compound, in combination with a polyglycerol ester of oleic acid known as "demal", serves as the emulsifier-stabilizer system of the emulsions now being used clinically. We have worked with emulsions containing 10 to 25 percent fat (usually 15 percent), and have used coconut oil, corn oil, peanut oil, olive oil, and butter fat. There is no synthetic triglyceride available in sufficient quantity for our purposes, but some day the preparation of such compounds should solve some of the problems of uniformity, contamination, etc. that are largely responsible for reactions now. The emulsions are made isotonic with 4.3 percent dextrose and water and have a pH of 6.7 to 7.0 without added buffers.

The utilization of fat emulsions introduced intravenously has been studied in many ways. Several litters of puppies have been reared, having had emulsified fat as their principal caloric source. Balance studies on animals and patients have demonstrated its utility, and triglycerides labeled with isotopic carbon have shown its ready availability for caloric needs. As much as 90 percent of injected radioactivity can be recovered in the expired carbon dioxide, the actual quantity depending upon the triglyceride used and the nutritional state of the animal. The most convincing evidence, however, has come from clinical observation of the patients receiving emulsions. There is no question about the beneficial effects of adequate caloric supplementation nor about emulsified fat as a means of supplying such.

The principal problem at present concerns the elimination of minor pyrogen and other reactions. The major sources of pyrogens have, we believe, finally been eliminated by purifying the starting materials and by protecting them from possible sources of pyrogens all along the line. Space does not permit me to describe the immense effort that has gone into this single phase of the project. At one time, for example, it involved the procurement of unbroken coconuts from the Pacific Islands, their transportation here, and the eventual extraction of their oil under semi-aseptic conditions. Several drug houses, the oil industry, and chemical firms have been involved at one time or another.

During the past year we have infused approximately 150 patients. They have largely been surgical patients, in poor nutritional condition, who were candidates for or convalescing from major operations. In most instances the fat they received has been a supplement to other forms of parenteral therapy, but in a few cases it has without doubt been life saving. One patient was maintained for 9 weeks without any oral intake, and several others have been carried along for periods of more than a month.

Pyrogen data have been collected during each infusion. It has been possible to carry out a detailed evaluation of hepatic function in 25 patients who received daily fat infusions for intervals up to 36 days, and liver biopsies have been obtained from some patients undergoing upper abdominal operations. This information has confirmed previous animal studies along identical lines. There has been no instance of hepatic impairment attributable to infused fat and, in fact, several patients with known hepatic damage prior to fat administration have shown evidence of improvement.

In describing our participation in the development of this new method of therapy I have not meant to imply an exclusive role in its clinical application. Similar work is being carried out at the Peter Bent Brigham Hospital and, of course, the larger load falls upon the Department of Nutrition of the Harvard School of Public Health. Neither have I intended to minimize similar important work being done by several other groups in other parts of the country.

It is worth emphasizing that this work is being carried out by the house officers and the nursing staff, and all of those who have participated can take pleasure in having contributed to this aspect of medical knowledge.

William R. Waddell, M.D.,
Assistant in Surgery

[When Dr. Waddell finished his residency here on December 31, he was the oldest ranking member of the house staff in terms of years of association with M.G.H. (interrupted by the war), having concluded his internship in 1944. For that reason, we felt that Dr. Waddell would have something of particular and timely interest to contribute to THE NEWS, as a sort of end-of-term paper. The above article proves conclusively that our assumption was correct, and we are planning on another article, from a similar source, for our next issue.—*Editor*]

Brief bits:—

Dr. J. Maxwell Chamberlain (*N.S.* 1934 & *W.S.* 1937) announces the removal of his office to 39 East 75th St., New York 21, N. Y., for the practice of Thoracic Surgery.

Dr. Earle M. Chapman, Associate Physician on our staff, addressed the Richmond County Medical Society in Augusta, Georgia, on January 17. His subject was "Disorders of the thyroid". On March 5, Dr. Chapman spoke at the Second National Cancer Conference, sponsored by the American Cancer Society, in Cincinnati.

Dr. Philip E. Meltzer, Surgeon in Oto-Laryngology at the Massachusetts Eye and Ear Infirmary, has been invited to give a series of lectures for the Oregon Academy of Ophthalmology and Oto-Laryngology, to be held in Portland, Oregon, from March 24 to 28. The subjects of his lectures will be "Middle ear disease and its relation to the postnasal space"; "The clinical aspect of otosclerosis and its therapy"; "The labyrinth: A discussion of normal and altered function"; "Errors in diagnosis by omission and commission". Dr. Meltzer will show a film depicting direct adenoidectomy.

Dr. Fred A. Simmons, Assistant Surgeon at M.G.H., gave a paper on "The correlation of the testicular biopsy with the semen analysis in the infertile male" at the Conference on the Biology of the Testes, at the New York Academy of Science, New York City, on January 26. Dr. Simmons has been elected a member of the Boston Surgical Society, and has been appointed a member of the Advisory Committee of the Robert L. Dickinson Research Memorial, established to promote research in scientific aspects of human fertility.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Robert L. Goodale, Surgeon in the Department of Oto-Laryngology, gave a paper before the Eastern Section Meeting of the American Triological Society in New York City last month. The subject of this paper, written jointly with Miss Anita Mangiaracine, Infirmary Bacteriologist, was "Clinical observations on the use of autogenous vaccine made from cultures of coagulate positive hemolytic Staphylococcus aureus".

Dr. David G. Cogan has been appointed a Consultant at the Los Alamos Scientific Laboratory of the University of California. He plans to travel to Los Alamos for two weeks' consultation in March regarding problems in radiation and its effects on the eyes.

Dr. Robert J. Brockhurst, who completed his residency at the Infirmary on November 1, 1951, has been appointed as Assistant in Ophthalmology.

Dr. Piero Perone of Livorno, Italy, began his residency on March 1. Dr. Perone studied at the University of Pisa and the University of Bologna, where he specialized in ear, nose, and throat work. He is now on a Fulbright Grant.

Dr. Knud Kristian Dreisler of Copenhagen is visiting the Infirmary. An ophthalmologist himself, he is particularly interested in the Eye Service here and the work of the Howe Laboratory. Dr. Dreisler is a graduate of the University of Copenhagen and formerly practised in that city. From 1949 to 1951 he worked in Ethiopia as one of the four eye specialists in the country.

CORRECTION: After graduation from the Infirmary on February 1, Dr. Irwin T. Mancall left for Hartford, Connecticut, to begin private practice there. Dr. Marvin Posner, also a February 1 graduate, will practise in Albany, N. Y. By mistake, we reversed these addresses in our copy submitted for the February issue of THE NEWS.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

This is the last issue of THE NEWS in which 1951 titles will appear, for the purpose of this column is to inform our readers of current or very recent articles written by MGH and E & E staff members.

The following new titles have been received:

Anesthesia

Keats, A. S., D'Alessandro, G. L., and Beecher, H. K.
A controlled study of pain relief by intravenous procaine.
J.A.M.A. 147:1761-1763.

Cancer Research

Aub, J. C., and Nathanson, I. T.
Neoplastic diseases.
Ann. Rev. Med. 2:343-366.

Bucher, N. L. R., Scott, J. F., and Aub, J. C.
Regeneration of the liver in parabiotic rats.
Cancer Research 11:457-465.

Emerson, W. J., Zamecnik, P. C., and Nathanson, I. T.
Effect of sex hormones on hepatic and renal lesions induced in rats by a choline-deficient diet.
Endocrinology 48:548-559.

Engel, L. L., Slaunwhite, W. R., Jr., Carter, P., and Olmsted, P. C.
A relation between phase composition and partition coefficients for the estrogens.
J. Biol. Chem. 191:621-625.

Glinos, A. D., Bucher, N. L. R., and Aub, J. C.
The effect of liver regeneration on tumor formation in rats fed 4-dimethylaminoazobenzene.
J. Exper. Med. 93:313-324.

Hoagland, M. B.
Effect of beryllium on plant phosphatase. (Abstract)
Federation Proc. 10:198.

Keller, E. B.
Turnover of proteins of cell fractions of adult rat liver *in vivo.* (Abstract)
Federation Proc. 10:206.

Loftfield, R. B.
The alkaline rearrangement of a-haloketones. II. The mechanism of the Faworskii reaction.
J. Am. Chem. Soc. 73:4707-4714.

Loftfield, R. B.
Y-chlorobutyraldehyde and its diethyl acetal.
J. Am. Chem. Soc. 73:1365-1366.

Nathanson, I. T.
Sex hormones and castration in advanced breast cancer.
Radiology 56:535-552.

Nathanson, I. T., Engel, L. L., and Kelley, R. M.
The effect of ACTH on the urinary excretion of steroids in neoplastic disease.
In Clinical ACTH, Philadelphia, The Blakiston Company, 1951, vol. 1—Research, pp. 54-64.

Nathanson, I. T., Engel, L. L., Kennedy, B. J., and Kelley, R. M.
Screening of steroids and allied compounds in neoplastic disease.
In Symposium on steriods in experimental and clinical practice, Abraham White, Editor, Philadelphia, The Blakiston Company, 1951, pp. 379-405.

Siekevitz, P., and Zamecnik, P. C.
In vitro incorporation of 1-C^{11}-DL-alanine into proteins of rat-liver granular fractions. (Abstract)
Federation Proc. 10:246.

Slaunwhite, W. R., Jr.
Graphical analysis of twenty-four transfer countercurrent distribution.
Analytic. Chem. 23:687-688.

Slaunwhite, W. R., Jr., Ekman, G., Engel, L. L., Nathanson, I. T., Pincus, G., and Carlo, J.
The separation and analysis of urinary oestrogens: A comparative study.
ACTA Endocrinologica 7:321-329.

Slaunwhite, W. R., Jr., Engel, L. L., Olmsted, P. C., and Carter, P.
The fluorescence and extinction and partition coefficients of estrogens.
J. Biol. Chem. 191:627-631.

Zamecnik, P. C., Loftfield, R. B., Stephenson, M. L., and Steele, J. M.
Studies on the carbohydrate and protein metabolism of the rat hepatoma.
Cancer Research 11:592-602.

General Medicine

Chapman, E. M.
Psittacosis: A case in Cape Cod.
J.A.M.A. 147:1343-1344.

Maloof, F., and Chapman, E. M.
Responses to radioactive iodine therapy in hyperthyroidism, with special reference to cardiac problems.
J. Clin. Endocrinol. 11:1296-1322.

Gynecology and Obstetrics

Meigs, J. V.
Radical hysterectomy with bilateral pelvic lymph node dissections. A report of 100 patients operated on five or more years ago.
Am. J. Obst. & Gynec. 62:854-865.

Meigs, J. V.
Removal of the pelvic lymph nodes in cancer of the uterine cervix. Transperitoneal (Taussig) and retroperitoneal (Nathanson) dissection.
Gynécologie Pratique 2:115-126.

Meigs, J. V.
The results of surgical treatment of cancer of the cervix uteri.
Am. J. Roentgenol. 65:698-708.

Sturgis, S. H., DeMuylder, E., and Meigs, J. V.
The uptake of labelled phosphorous by cancer of the cervix.
Ann. Surg. 133:305-312.

Wheelock, F. C., Fennell, R. H., Jr., and Meigs, J. V.
Carcinoma of the ovary: Clinical and pathological evaluation.
New England J. Med. 245:447-449.

Neurology, Neurosurgery, and Psychiatry

Selverstone, B., and White, J. C.
Evaluation of the radioactive mapping technic in the surgery of brain tumors.
Ann. Surg. 134:387-396.

Nursing Education

Perkins, D., and Heslin, P.
Nursing service and nursing education advance together with the team plan.
Am. J. Nursing 52:185-188.

Ophthalmology

Johnson, C. C.
Some practical points in ptosis surgery.
Am. J. Ophth. 35:108-109.

Oto-Laryngology

Evans, M. G.
The treatment of acute suppurative otitis media: The relative merits of chemotherapy and myringotomy in avoiding surgical mastoiditis.
Ann. Otol., Rhin. & Laryng. 60:638-647.

Dr. Edwin B. Dunphy
Chief of Ophthalmology, Massachusetts Eye and Ear Infirmary

STAFF WIVES

All MGH Staff Wives were invited to a morning coffee in the Walcott living room on Thursday, February 14. Dr. Clark extended an official welcome to us and spoke of the many ways in which the doctors' wives can be of service to the hospital. Our group has two representatives on the new Coordinating Committee, which includes members from the various agencies already functioning in the hospital. Miss Sleeper spoke on hospitality and told about several of her interesting experiences in Europe last summer. Mrs. Bauer gave a summary of what the group has attempted this year and outlined tentative plans for the future.

The March 5 meeting was held in the Archives Room.

All who can attend the April 2 meeting are urged to have lunch with the members at noon in the Nurses' Cafeteria. Please call Mrs. Weiss's office (LA 3-8200, Ext. 828) by March 31 if you wish to be included in the hospital tour at 11 A.M. This is an excellent way to become acquainted with the hospital.

At the February meeting the following members were elected to the executive committee:

Mrs. Walter Bauer, Chairman
Mrs. Joseph Aub
Mrs. Richard Sweet
Mrs. Bradford Cannon
Mrs. Dana Farnsworth
Mrs. Dean Clark
Mrs. J. C. White
Mrs. Augustus Thorndike
Mrs. Howard Ulfelder

New addresses:—

Dr. Harold E. Elrick (*M.* 1944), Research Institute, Montreal General Hospital, Montreal, Canada.

Dr. Joseph A. Holmes (*Path.* 1936 & *E.S.* 1938), 94 Russell St., Waltham 54, Mass.

Lt. John W. Littlefield, MC, USNR (*M.* 1948), U.S. Naval Hospital, Great Lakes, Ill.

Dr. John S. Rhodes (*r.s. U.* 1935), 700 West Morgan St., Raleigh, N. C.

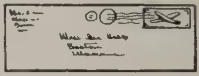
Dr. Thomas S. Risley (*E.S.* 1942), 1 Monument Sq., Beverly, Mass.

Dr. John D. Stoeckle (*M.* 1949), Research and Development Board, Department of Defense, Washington 25, D.C.

Capt. Masao Yatsuhashi, MC, USAR (*W.S.* 1945), 8059th AU, c/o Postmaster, San Francisco, Calif.

CORRECTION

Dr. John Homans (*S.S.* 1904) is at 1180 Beacon St., Brookline; Dr. John Homans, Jr. (*W.M.* 1942) is at 205 Beacon St., Boston. The notice that came to us of a new address for Dr. Homans, Jr., which we published in the February issue of The News, omitted the Jr.



Ever since World War II three names have appeared in the MGH Directory with only "In military service" as their addresses. When the Archives Department took over the work of preparing the Directory section of the soon-to-be-issued MGH Annual Report, we decided to locate these men and procure their present addresses. In two of the three instances the task was simple, but in the case of Dr. George F. Sutherland, Resident Physician in Psychiatry at McLean in 1941, we ran upon a snag. None of our leads produced the information we wanted; the A.M.A. Directory lists two George F. Sutherlands, and we had no way of knowing which was our man. But, nothing daunted, we still kept at it and by devious routes, including a letter to a man in British Columbia who "might just possibly be an uncle of one of these George F.'s", we finally tracked down the man we were seeking. (Missing Persons Bureau please note!)

This is the reply, in part, to our letter to Dr. George F. Sutherland of Baltimore, the subject of our search:

> I am now living in Baltimore and my present official title is Chief, Division of Psychiatric Education and Training, Department of Mental Hygiene, State of Maryland, located at 2218 North Charles St., Baltimore 18, Md. I am to establish a postgraduate school in the State of Maryland's mental hospital, so that M.D.'s may train there to become psychiatrists.

We regret that Dr. Sutherland's present address was not secured in time for it to appear in the coming MGH Directory, nor was that of one other of the three men mentioned above—that of Dr. Hewitt I. Varney, Resident Physician in Psychiatry at McLean in 1938, whose address is 1835 Eye St. NW., Washington, D. C.

This short note came from Dr. William J. Kerr (*W.M.* 1916), from the University of California Hospital, San Francisco 22:

> I was on sabbatical leave of absence for the period January 1 through December 31, 1951, in the mountains of California—not for purposes of health, although it has helped to get the water out of my muscles and the cobwebs from my brain. In April 1951 I was Visiting Professor at the Vancouver General Hospital for a week with Dr. George F. Strong.

THE NEWS

No. 111 Boston, Mass. April 1952

SOCIAL SERVICE DEPARTMENT

The thirty reports from the staff members of the Social Service Department—assigned to every clinical service, the two private pavilions (Baker Memorial and Phillips House), the Emergency Ward, and several research projects—show service to 9559 patients in 1951. They show concrete evidence of continuing awareness and understanding of the social and environmental aspects of illness and the utilization of the "social laboratory"in all three functions of the Hospital—care of patients, teaching, and research.

The number of patients served has remained fairly consistent in the past three years, but a significant trend is revealed in further analysis of the figures. There is a marked increase of over 704 more patients referred in 1951 for long-range, complicated social adjustment plans than in 1950. These patients require continuing, comprehensive casework service over months, and sometimes a year or more. On the other hand, there is a decrease of approximately 900 referrals for immediate, limited services which may be carried through in a few hours or days and which are often more appropriately handled by case aides or other Hospital departments, such as Admitting, Nursing, or the Record Room. The corollary to this changing and discriminating type of referral is the increasing accumulative case loads for each worker. This is true in practically all the services but has been most apparent in the General Surgical Services, where the surgeons and Miss McHugh and the surgical Social Service staff have together recognized the long-term, complicated adjustment problems for patients with diagnosis of malignancy and those who have undergone amputations, mutilations, or major surgery.

There are several factors which may account for this change. Our tools for understanding and dealing with human adjustment problems of illness have increased with the advances in medical treatment and rehabilitation, with the growing understanding through psychiatry of human dynamics, and with community efforts to increase facilities for assisting patients in meeting their problems. We are setting our goals higher in terms of rehabilitation and relief of suffering and are no longer satisfied to send the patient on his way after a good, immediate, patching-up job. There are still many times when we fall short of the goal or even fail completely, but as the medical team continues to work together, coordinating and utilizing the special knowledge of each member, we shall come nearer to helping patients in the satisfactory management of their illnesses and handicaps.

There are the usual major problems of chronic disease, rehabilitation, financial insecurity, work adjustments, and terminal care noted in the 1951 reports. Various services and departments present special problems.

Neurological Service

On the Neurological Service, with 452 referrals, the largest group referred to Social Service was made up of patients with problems related to epilepsy; the second, those with brain tumors; and in the third, the numbers were equally divided between patients with cerebral vascular accidents, multiple sclerosis, Parkinson's disease, and language disabilities. As to the ages of those referred to us, the largest group was made up of patients between 40 and 50, the second largest those between 20 and 30. Because of the chronic, progressive, and often terminal nature of the neurological conditions in these age groups, the social problems were serious in terms of 1) patient's and family acceptance and adjustment to the disability, 2) continued employment and maintenance of family income, 3) provision for chronic or terminal nursing care.

Orthopedic Service

Problems of rehabilitation and the costs of medical care are highlighted in the report of the orthopedic workers. On top of expensive, long hospitalization, patients and their families must meet or be assisted to meet costs of braces, often $60 to $150, six to eight weeks of nursing home care at $30 or more a week, special shoes, bicycle exercisers, and, later, frequent transportation back and forth for physical therapy and rehabilitation.

Costs of medical care

Because of the concern of the admitting officers and the social workers that realistic rates and credit payment plans be made in view of the total costs of illness, the social workers on all services are sharing with admitting officers information about all these extra costs and how they are being met. These facts are noted on the Hospital account cards and give a far more accurate picture of the total costs of the illness and a sounder, more realistic basis for establishing credit.

In analyzing the $22,824 for ancillary medical costs for which the Social Service Department was responsible because of its financial assistance to patients in 1951, there were two hopeful trends. Patients were paying on time a greater amount than in previous years, and payments by Departments of Public Welfare increased materially.

Psychiatric Service

Due to the able leadership of Miss Sylvia Perry, Supervisor of the Psychiatric Social Service unit, there has been a steady and sound expansion in service to patients, teaching, and research. With a stable and experienced staff, the workers have kept a balance between all three functions and have maintained a high standard of service to an increasing number of patients in both the Children's and the Adult Divisions. Simmons and Smith College Schools of Social Work have recognized the Department as a valuable training center—Smith College, particularly, for its advanced third year students. Both Miss Perry and Miss Grace Nichols have taught classes at the two schools on temporary assignments. Research studies, in cooperation with the doctors, have been continued on children's reactions to T and A operations. Miss Beatrice Talbot completed her work with the Rheumatic Fever Project and contributed information concerning and understanding of the mothers' reactions toward their children who are afflicted with rheumatic fever. Other studies with asthmatic and arthritic children have continued under Federal Grants. Three students wrote theses of considerable value to the Department.

A study of referrals to Social Service from the Psychiatric Ward for the past three years shows constructive, realistic use of the social worker. The majority of patients were referred for help with employment, living arrangements, or help for other members of the patient's family who were bringing pressure upon the patient. Patients were referred for realistic social problems, and the social work consisted both of modifying directly environmental pressures and in helping patients toward some modifications of their feelings toward environmental difficulties when little change could be made in their social situations.

Baker Memorial and Phillips House

In view of the formation of the MGH Associates, it is interesting to note increased referrals to Miss Duguid from both Baker Memorial and Phillips House, and 48 referrals of patients from the private offices of the staff for direct service and consultation. A full range of social complications may attend sickness wherever it strikes, and need for social service help is not limited to the low economic groups.

Besides the regular on-going services of the Department, several new ones have been added.

Alcoholic Clinic

With the establishment of the new Alcoholic Clinic, under Dr. Volta Hall, Miss Martha Sherwood was assigned as full-time social worker in the Clinic and is paid through funds from the Massachusetts Department of Public Health. Miss Sherwood's main responsibilities to date have been to interview patients at intake for social information useful to the doctors in screening the patients who can be helped by treatment, to work with patients already under treatment by helping them directly with employment or family difficulties, or to work with relatives, particularly the wives who need assistance with their own problems and help toward understanding the patient's problems and aiding him in meeting them.

Emergency Ward

At the request of the Hospital Administration in their study and reorganization of the Emergency and Overnight Wards, a social worker was assigned in November 1950 for a two-month study period of four days a week. Mrs. Anne Krush, an experienced former staff member, studied the problems of patients and their families in this anxiety-laden traffic center of the Hospital. With the Administration and members of the Emergency Ward staff, she made recommendations which would improve the care of patients and our relationships with families and the public in this key place of the Hospital. Following this, it was agreed that a social worker, full-time in the Emergency Ward, should be continued permanently. A complete year's experience during 1951 has demonstrated the value of this decision, both in direct social services to patients and their families and in better understanding by all our personnel of patients' needs and the handling of them under tension and anxiety in an emergency situation. Earlier referrals are resulting in better and quicker discharge plans and fewer readmissions.

Adult Cardiac Service

Miss Clara Cory has been assigned for over a year to the Adult Cardiac Service, through funds from the Massachusetts Department of Public Health. The adjustment to cardiac disability with which patients are often suddenly confronted involves many disruptions of family and work life. We hope to study the meaning of the disease and the variety of patient-reactions to this illness, as we now have one worker available who can become better acquainted with the patients and follow through with them in their adjustments. For four months, March through June 1951, under funds from the Massachusetts Department of Public Health, a special survey was made on the vocational and employment needs of patients with cardiac disability. Mrs. Abigail Peck, experienced in vocational counseling, worked with Miss Cory in interviewing and following patients referred for work adjustment. While the survey was of necessity brief, several conclusions may have validity as to need for:

1. Defining more accurately actual work capacities of the cardiac patient
2. Evaluation of the patient's vocational potentialities by a team composed of a cardiologist, psychiatrist, vocational counselor, and social worker, such as is done in Dr. Goldwater's work classification unit in New York
3. The considered timing of referral for work adjustment and retraining at the point when the patient has accepted his disability realistically and is more adequately prepared to undertake retraining or change of job
4. Increased facilities in the community for vocational testing and guidance, retraining, and employment placements

It is to be hoped that a work classification unit for cardiacs may be established in Boston some time in the near future.

Team work and Medical-Social Rounds

Miss Dorothy Kellogg, Supervisor of Social Service for the Medical Wards, writes in her report, "The purpose of casework service is to help to establish useful relationships between people and their medical services in the Hospital and in aftercare. . . . Social Service is available, as called upon by doctors, when supportive planning with the patient and family or social group is needed to make hospital care effective and to safeguard its results." This purpose cannot be accomplished without the combined efforts and shared knowledge of the medical team. One of the most effective methods for carrying this out is the weekly Medical-Social Rounds, which have become an integral part of almost every service in the Hospital. While the services vary in their organization of Rounds, the Pediatric and Medical Services have developed their Rounds to a most satisfactory degree, from the standpoint of social service participation.

This year the Pediatric Rounds have been expanded to include—in addition to house staff, nurses, social workers, and medical students—the visiting pediatrician, a visiting child psychiatrist, and a Public Health Nurse.

In a brief survey of the regular weekly Rounds held on all four Medical Wards the following interesting facts were revealed: During 1951 there were 76 different doctors and 66 fourth year medical students from our Medical Services who took regular part in the Medical-Social Rounds in the course of their rotation. Twenty-six different visiting men, 5 residents, 16 assistant residents, 23 house officers, and 6 doctors from the Arthritis Service were included in this number. With such wide participation by the medical staff with nurses, social workers, and other special visitors, one can see the potentials in patient care and in teaching and research as knowledge is shared. Miss Kellogg cites one example—that of a young woman, mother of four children, treated on the Medical Wards for alcoholic cirrhosis. Without effective teamwork treatment in the Hospital and in the community, her four children would have been sent away, the home broken, the patient rehospitalized, and the husband and relatives placed under severe and heartbreaking strain. For an entire year the patient and home have been kept intact, with evidence of continuing good results.

We have much yet to learn about patient-care in its broadest aspects; but these Rounds—described by Dr. Bauer as the time when the entire ward team engages in considering all aspects of patient-care and how the practice of medicine with its allied services can benefit the patient, his family, and the social group—go far in helping us all to approach more nearly our goals for rehabilitation of the patient.

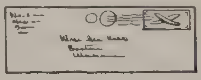
Josephine C. Barbour,
Chief of Social Service

* * *

Dr. Henry K. Beecher, Chief of our Anesthesia Service, has recently been made an Honorary Member of the Royal Society of Medicine, London, England.

On February 14 the Buffalo Surgical Society awarded the Roswell Park Medal to Dr. Edward D. Churchill, Chief of our General Surgical Services, "in recognition of his achievements in the science and art of surgery and his invaluable services to the medical profession and humanity." The award was made by the president of the Society, Dr. John D. Stewart. Dr. Stewart received his surgical training at the Massachusetts General Hospital, where he subsequently served as an active member of the full-time staff until August 1941, when he left to accept the Professorship of Surgery at the University of Buffalo.

Dr. Robert S. Schwab, Associate Neurologist on our staff, has gone to France to address the medical faculty at the University of Montpellier. He will speak on some of the investigations which have been made into the subject of fatigue in human beings. This work has been done at the Massachusetts General Hospital, under the sponsorship of the Office of Naval Research of the U.S. Navy. Dr. Schwab will deliver his lecture in French.



New addresses:—

Dr. John R. McDaniel (*E.S.* 1940), 902 Edmond St., St. Joseph, Mo.
Dr. Henry D. Moorman, Jr. (*W.S.* 1943), 431 Thirtieth St., Oakland 9, Calif.
Dr. Nathan D. Munro (*E.S.* 1942), 740 W. Michigan Ave., Jackson, Mich.
Dr. Kenneth L. Stout (*r.p. D.* 1935), 4418 Vineland Ave., N. Hollywood, Calif.

MALLORY MEMORIAL FUND

The Trustees of the Massachusetts General Hospital have voted "to establish a special fund to be known as the Tracy Burr Mallory Memorial Fund, to be used for some suitable memorial in the proposed new Pathology Building."

Contributions to this fund may be sent to the Treasurer, Massachusetts General Hospital, 45 Milk Street, Boston.

HYPERTENSION CLINIC

The average number of patients in the Hypertension Clinic is falling off. In the year or two following the war, a daily attendance of twenty-five to thirty patients was usual. Often there were more. Effort was required to keep the case load at a figure to insure efficiency both in clinical study and in routine care. Latterly the pressure has been less, due in part to the increased cost of the hospital out-patient visit and of laboratory study. Frequently, the cost of special tests, X-rays, electrocardiograms, appears to be a hardship for many patients. Unless absolutely essential for routine management, it does not seem fair to ask many of them to accept this recurring financial burden. When required as part of a clinical research, some financial aid is necessary.

Quite often we are requested to make clinical trials of new hypotensive drugs. The manufacturers are ready to supply the drugs. We have "pedigreed hypertensive patients", willing and suitable for a trial of some new drug. We think, and the Research Committee thinks, the manufacturers should pay for the cost of desirable laboratory studies, the patient's clinic fee, and some additional monies in return for the name and fame of the Massachusetts General Hospital. While such cash doubtless is eventually loaded onto each tablet subsequently sold, this seems to be a suitable distribution of the cost of development.

Several hypotensive drugs are under investigation. Dr. Currens and the cardiac catheterization team are interested in the hypotensive effects and hemodynamics of protoveratrine. The hexamethonium compounds are to be tried in the clinic, and our surgical colleagues, including the Peripheral Vascular Clinic, are interested in the same substances. Some work has been done on thalazine. Veriloid, from Veratrum Viride, is generally available for prescription and appears to be helpful in controlling the blood pressure level.

With the cooperation of Miss Meenan, the class method of dietary instruction has been started. Fifteen patients have had a course of fifteen sessions on a balanced reducing diet without special restriction of salt. After completion of this course many of the same patients, with a few additional ones, are now on a moderately low sodium, low fat, moderate to high protein diet. Results on weight and blood pressure levels are being compared with the achievement of the previously studied rice diet.

We would like to know whether or not the class method obtains better cooperation from the patient, saves time, and is more lasting in control of the patient's weight than individual instruction. The group method, with patient-participation in mutual instruction of each other, may have important psychological effects. On severely restricted diets, patient reaction sometimes becomes hostile to the doctor or the clinic. This was observed in the use of the rice diets. It suggested, sometimes, the personality reaction of subjects on a starvation regime. For instance, at a recent session one of the patients reported her pleasure at first losing weight, then her failure to lose, and final disappointment when she gained. Discussion, and questions and answers led in the end to her publicly confessed resentment, her near failure to return to the clinic, and, at last, her conclusion that she was mad at herself for not being able to do what she knew was best for her. The solution may be to provide continuous self-motivation. We would like to find a way to provide independence for the obese of both excessive food intake and continuous medical or dietary supervision.

Mrs. Dorothy Callahan, dietitian, and Mrs. Gertrude Roberts, working on follow-ups and recording the blood pressures, are the mainstays of this interesting project.

During the year we have made another follow-up of our series of patients with hypertension, graded according to severity. No new patients have been added to this study since 1941-42, at which time the average follow-up was four years. With the late Dr. Loofbourow, a restudy of this group was made in 1946-47. The present study, therefore, is a twelve-year one. Predictions made originally, according to severity of organic changes, have been found to be quite accurate and we believe the survival curves add extremely important data to our knowledge of the natural history of essential hypertension in man. This study and the dietary studies are being supported by contributions to the Dorothea Loofbourow Fund from the many friends and patients who miss her counsel, companionship, and care—as do all of us in the clinic.

Studies being carried out by Dr. William P. Chapman, in collaboration with the neurosurgeons of this Hospital, the Boston Psychopathic Hospital, and the State Hospital for Mental Diseases at Howard, Rhode Island, are determining the effect of the electrical stimulation of the cerebral cortex and underlying brain structures on blood pressure, heart rate, and respirations, as well as on the mental and behavior patterns of patients undergoing lobotomy for psychiatric disease. Also, in collaboration with Dr. Helen Deane, Director of Anatomy at Harvard Medical School, Dr. Chapman is making an investigation of the histochemical changes of the adrenocortex in patients with hypertensive vascular disease and in non-hypertensive patients. In progress are studies to determine the possible role of the vagus nerve in initiating the pressor responses from the brain in animals and in man.

Dr. John Denovian is supervising benzodioxane tests in essential hypertension, carrying on the work formerly done by Dr. Henry Kowalski, now on the Boston City Hospital staff. Dr. R. B. Khambatta of Karachi, Pakistan, a graduate student at the Hospital this year, is working with us in the clinic. The hypertension laboratory continues other testing procedures. Dr. Chapman expects to make another study of sympathectomized patients, in cooperation with Dr. Kenneth Evelyn of McGill University Medical School.

What would any clinic be without volunteer workers? The answer is it would not be a clinic. Since the war the volunteers have never, for one day, missed covering our clinic. Mrs. Florence Dodson, Mrs. Arthur Thiessen, and, previously, Mrs. Eleanor Hart, keep our records, greet our patients and us, record the time of our coming and going, chide us when we need chiding, encourage us when we need encouragement. All their ways are ways of pleasantness.

Robert S. Palmer, M.D.,
Head of Hypertension Clinic

The Board of Trustees, at their meetings on February 21 and March 7, voted:

To accept with regret the resignation of Dr. William R. Eyler, effective March 1;

To postpone the retirement of Dr. Joe V. Meigs to June 30, 1956.

To appoint:

Dr. Roy L. Byrnes as Third Assistant Resident in Pathology for one year, beginning July 1;

Dr. Thomas L. DeLorme as Assistant Resident in Orthopedic Surgery for one year, beginning April 1, 1953;

Dr. Charles P. Gore as Assistant Resident in Psychiatry for a period of six months, beginning July 1;

Dr. Sven Hellerstrom as Honorary Dermatologist pro tempore for the month of March;

Dr. Lawrence J. Kunz as Assistant Bacteriologist, in active charge of the Hospital Bacteriology Laboratory from July 1, 1952 through June 30, 1954;

Dr. René S. Mach of Geneva as Honorary Associate Physician pro tempore;

Dr. Thomas F. Paine, Jr. as Chief of Bacteriology from July 1 until the end of his current appointment in Communicable Diseases, namely June 30, 1954;

Dr. John B. Stetson as Assistant Resident in Anesthesia for one year, beginning November 15;

Dr. Jacob Stovner as Assistant Resident in Anesthesia for nine months, beginning July 15;

Dr. Frederick S. Tomchik as Second Assistant Resident in Radiology, beginning January 1, 1953;

Dr. Robert H. Walker as Second Assistant Resident in Surgery for one year, beginning July 1.

At their meetings held on February 13, 20, and 27, the General Executive Committee voted:

To reappoint Dr. Leo Brahm as Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, for the month of March;

To promote Dr. Richard B. Cohen from the position of Assistant Resident to that of Resident in Pathology for one year, beginning July 1;

To grant Dr. Carlo Mauro the title of Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, to cover the course he is taking under the direction of Dr. Edward B. Benedict;

To give Dr. Lidio Mora the additional title of Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, to cover his work under Dr. Benedict, for the period January 28 through April 28.

To appoint:

Dr. William J. Dowling as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Joachim S. Gravenstein as a Fellow in Anesthesia for one year, beginning April 1;

Dr. Charles H. Ratner as Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy;

Dr. Traute Richter as a Fellow in Anesthesia for one year, beginning January 1, 1953.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Dermatology

Lever, W. F.
Diseases of the skin.
In The child in health and disease, 2nd edition, C. G. Grulee, and R. C. Eley, Editors, Baltimore, The Williams and Wilkins Company, 1952, pp. 972-1001.

General Medicine

Jacobson, B. M., and Sohier, W. D.
The effects of ACTH and of cortisone on the platelets in idiopathic thrombopenic purpura.
New England J. Med. 246:247-249.

General Surgery

Hamlin, E., Jr.
Limited excision of Dupuytren's contracture.
Ann. Surg. 135:94-97.

Laboratory Science

Cori, O., and Lipmann, F.
The primary oxidation product of enzymatic glucose-6-phosphate oxidation.
J. Biol. Chem. 194:417-425.

Edwards, W. S.
The effects of lung inflation and epinephrine on pulmonary vascular resistance.
Am. J. Physiol. 167:756-762.

Gregory, J. D., Novelli, G. D., and Lipmann, F.
The composition of coenzyme A.
J. Am. Chem. Soc. 74:854.

Nursing Education

Perkins, D.
A program to develop team leaders.
Am. J. Nursing 52:309-311.

Physical Medicine

Watkins, A. L.
Physical Medicine for the neurologic patient.
New York State J. Med. 52:315-318.

Watkins, A. L.
Practical applications of progressive resistance exercises.
J.A.M.A. 148:443-446.

⁂

To the Editor: Your kind invitation to write an article for THE NEWS made me wonder what I could write that might possibly have general interest for the hospital family. Your words that Dr. Waddell and I were ". . . the oldest ranking members of the House Staff in terms of years of association with the M.G.H." gave me the answer. I began to ponder on why the current formal surgical training is so long, and hoped it was not just due to ineptitude and slowness on the part of today's trainees.

I must admit that your words gave me a bit of a start. I had considered myself relatively young, but on rereading your letter, checking my receding hairline, and answering Harvard's request to choose a retirement plan, I began to feel a bit bent and weary. I put on my slippers, sat before the fire, and mused over my experiences of the past seven years. The fire was warm, my head nodded. . . .

The judge rapped his gavel and looked at the jury. The twelve faces seemed familiar. One, a bit sallow, looked like the old man who had not survived a pancreatectomy. The beaming lady next to him was certainly Myra Owens who was so grateful after her gastrectomy, and the little man behind her with the artificial leg? Wasn't he Antonio, who sang so loudly on the wards? All the faces of the jury—sad, puzzled, smiling—looked familiar.

The judge cleared his throat and addressed the jury: "Ladies and gentlemen, you are to decide if current surgical training is guilty of embezzlement. Is it using time wisely or spending it foolishly? Are five, six, or seven years justified and necessary as a period of formal training, or are economy and efficiency lacking? This is for you to decide."

The courtroom was hazy. Over the buzz of voices the prosecuting and defense attorneys scowled at each other.

The prosecution rapidly presented its facts. In vehement tones it pointed out that the most capable and brilliant surgeons of today had had very little hospital training, but that many significant contributions of clinical and physiological importance have been made by these men who had cut the "apron strings" of the hospital after a short period of formal training. Over the shouted objection of the defense, the present-day program was described as impractical, time-consuming, and unnecessary.

The defense attorney, in turn, belabored the shorter training program of twenty years ago as inadequate. He pointed out that men trained in that era had little spare time, were forced to carry a heavy work-load, were resistant to new ideas, and failed to make any important contribution to surgery as they grew older.

The debate was hot and furious. The judge pounded his gavel incessantly, the room was in an uproar over the angry protestations of the two attorneys.

Through the din, a voice rose clearly: "Gentlemen, if you will forgive me, I do not think there is much to try."

The two attorneys glanced at each other suspiciously. Was this a trick? Neither of them had called this man. The old gentleman went on, the courtroom was strangely silent.

"There is really not much difference in the aims of surgical training today as compared with those of twenty years ago. We were then, and are now, trying to give our young men a basic training in surgery. Granted a certain amount of technical ability, and dexterity will come later with experience. Through the years many new fields of surgery have been developed. With better anesthesia, fluid and blood replacement, and chemotherapy, more operations are made possible than were dreamed of a generation or two ago. Our senior surgeons of today are the men responsible for this. In turn, the young surgeon today must be exposed to a longer period of training, so that he too may emulate his predecessors and continue to develop new techniques."

Both attorneys had seated themselves. They no longer glared at each other, but were staring attentively at the speaker.

"The primary function of a hospital is the care of the sick, and any institution accepting the responsibility of caring for the sick also assumes the responsibility of training physicians. This training today must necessarily be longer, for we have a far greater fund of basic knowledge and experience to impart. Would it not be proper to ask ourselves how much longer the training period will be in the future, rather than to attempt to justify the length of past or present formal training?"

As the old gentleman finished his speech he turned and walked slowly toward the door.

"But who are you?" asked the judge. "Why are you concerned with this trial?"

"Because I am the spirit of Hippocrates," was the quiet reply, as the courtroom door closed softly behind him.

The defense attorney accepted the proffered cigar of the prosecutor. Smoke filled the courtroom. . . .

I woke with a start. The fire had gone out and the room was cold. And so to bed.

George L. Nardi, M.D.,
Assistant in Surgery

HOUSE STAFF CLUB

For some time the Hospital administration has been considering plans for the establishment of space in the Hospital where the house staff could entertain guests, hold informal meetings, and provide recreation in a pleasant atmosphere. At a recent meeting of the Board of Trustees the suite of rooms on the thirteenth floor of the White Building was chosen for this new House Staff Club.

Following the Trustees' action, Dr. Clark appointed a committee from the house staff to outfit and maintain management of the new Club quarters, and the suite of rooms was opened on February 16. At the moment the furnishings consist primarily of pieces of furniture which the Hospital had on hand, and Dr. Clay has made arrangements for obtaining the radio-phonograph formerly used in the Moseley Rotunda. When the plans for the Club were being made, the Ladies' Visiting Committee generously voted us $203 for the purchase of an FM radio and a television set. The former has been used regularly since the opening, and we are in the process of getting the latter within the next month. The committee has asked the house staff to contribute to a fund to help buy more furniture and some non-medical magazines. Gifts of subscriptions to such publications would be greatly appreciated. A recent poll of the house staff included the following as the most popular and worth while: *Time, New Yorker, Life, Saturday Review of Literature,* and *National Geographic.*

The Club is anxious to obtain phonograph records for its growing record library. With the recent change from 78 rpm to long playing records, many of the Visiting Staff or other friends of the Hospital may have records which they consider valuable but which they plan to replace with LP versions. We would appreciate either 78 rpm or LP records for our library. Special funds earmarked for records will be used in the purchase of LP records. We hope to build up a first-rate record collection during the next few years.

On December 15 a House Staff Christmas Party was held in the Club, under the sponsorship of the Distaff Club. It was an overwhelming success, with well over a hundred people attending. We hope to repeat the initial successful venture with an *all* House Staff Party in the late spring, before the house staff changes on July 1.

Recently, the wives of the Visiting Staff organized a spirited drive to decorate the suite, to make the Club one of the most attractive in the United States. In addition to being isolated from the rest of the Hospital, the view from the thirteenth floor up the Charles River is one of the finest in Boston. It is hoped that the Club will become the permanent quarters for a prospective House Staff Organization.

Larry Barrows, M.D.,
Chairman, House Staff Committee

BIOGLETS

Dr. James C. Appleton, Assistant Resident in Anesthesia – born in Hamilton, Ohio, April 7, 1922; B.A., Miami University, Oxford, Ohio, 1943; SV-12, University of Louisville School of Medicine, 1943-46; Intern, Springfield City Hospital, Springfield, Ohio, 1946-47; U.S. Navy: G.L.N.T.S., Great Lakes, Illinois, and Greater Mariana Islands Health Officer and Dependents Service, NOB, Saipan, 1947-49; general practice in western Kentucky, 1949-50 (several months of this year were spent in St. Louis and McKinney, Texas, recovering from poliomyelitis); Resident in Anesthesia, V.A. Hospital, McKinney, Texas, participating in original research in pain control, in collaboration with Dr. F. A. Duncan Alexander, 1950-52.

Dr. Peter E. Sifneos, Resident in Psychiatry —born in Greece, October 22, 1920; graduated from the Sorbonne University, Paris, in General Chemistry, 1940; graduate work in chemistry at the Massachusetts Institute of Technology, 1941, and at Harvard, 1942; M.D., Harvard Medical School, 1946; U.S. Army: served in the U.S. Army of Occupation in Frankfurt-on-Main, Germany, 1948-49, in Psychiatry at the 97th General Hospital; McLean Hospital, Waverley, Mass., 1950-51; married; a daughter, 5 months old.

STAFF WIVES

As the organization of the MGH Staff Wives has progressed, it has become increasingly apparent that one of the major interests of the group is to promote a closer relationship between doctors and their wives from other countries and the doctors and wives of the MGH Staff.

On Tuesday, March 18, a tea was held in the Medical Staff Room of the Bulfinch Building in honor of these visiting doctors from other countries and their wives. It afforded an excellent opportunity for the two groups to meet and proved to be a most delightful affair. Mrs. Charles Kubik graciously donated the flowers for the occasion, and Mrs. S. Forrest Martin made the lovely floral arrangements.

Many of the Staff doctors and their wives have expressed an interest in inviting more of our visitors to their homes. Mrs. Joseph Aub is chairman of a committee to promote such hospitality. Assisting her are Mrs. Nathan Talbot, Mrs. Bradford Cannon, and Mrs. Howard Ulfelder. Every effort is being made to maintain an accurate list of the doctors who are here from other countries, together with data about their families, interests, etc. Those who would like to invite these visitors to their homes may telephone Mrs. Aub, Belmont 5-1337 or Mrs. Soma Weiss, Lafayette 3-8200, Extension 828. Hospitality of this kind is an expression of personal welcome to our country and an opportunity for all of us to become better acquainted with one another.

The Staff Wives are active in many other ways. For instance, Mrs. Richard Sweet, who is head of the Surgical Dressing Committee, is organizing groups to meet in suburban areas. In these groups those who find it difficult to come in to the Massachusetts General may make bandages for the Hospital by working in their own communities. Anyone who is interested in helping with this important work is asked to contact Mrs. Sweet at Longwood 6-5671.

Miss Sleeper has again appealed to those doctors' wives who are graduate nurses to devote of their free time to the Nursing Service. This would be greatly appreciated, for there is real need of their help.

Mrs. Walter Bauer and Mrs. Richard Sweet represented the Staff Wives at the last meeting of the Coordinating Committee. This committee attempts to integrate the activities of the many volunteer groups within the Hospital.

The regular monthly meeting of the Staff Wives was held on April 2. The next meeting will be Wednesday, May 7. The meetings are held on the first Wednesday of each month, and the wives of all doctors on the Staff are most welcome. Those who have been unable to participate to date are urged to attend meetings whenever they can. Meetings are held in the Archives Room of the Moseley Building at 1:15. Those who come early are invited to meet for lunch at noon in the Nurses' Cafeteria. A table is reserved in the name of Mrs. Walter Bauer, and the cashiers will be happy to direct members to it.

Through the MGH NEWS we will endeavor to keep our readers posted on the activities of the Staff Wives. If your husband doesn't bring THE NEWS home to you, why don't you subscribe yourself? The price is $2 per year, and you will then know what is going on.

* * *

The Institute of Pastoral Care, Inc., has announced that during the coming summer it will again sponsor six- and twelve-weeks' courses in general and mental hospitals, for clergy, theological students, and other professional religious workers.

Supervised training is to be given in the pastoral care of the sick, pastoral counseling of upset and troubled persons, and the dynamics of interpersonal and interprofessional relationships.

The schedule will include some part-time volunteer orderly service, pastoral calls on patients, study and discussion of clinical notes on their pastoral interviews written by the students, observation of clinical procedures, correlated reading, and daily attendance at planned lectures and seminars.

A descriptive folder and application form may be obtained from Rev. James H. Burns, Executive Secretary, Institute of Pastoral Care, Inc., Massachusetts General Hospital, Boston 14, Mass.

Dr. LeRoy A. Schall
Chief of Otolaryngology, Massachusetts Eye and Ear Infirmary

Feby 23, 1827

MASSACHUSETTS EYE & EAR INFIRMARY

The Annual Alumni Meeting will be held at the Infirmary on Wednesday, April 16. As usual, the program will coincide with the New England Ophthalmological Society Meeting on April 15 and the New England Oto-Laryngological Society Meeting on the 16th, both held at the Infirmary. The Infirmary will serve the Alumni Luncheon at noon; the Dinner, as in previous years, will be at the Harvard Club.

Three Infirmary staff members have been guest speakers on "You and your health", a medical education series presented weekly on television by the Massachusetts Blue Cross and Blue Shield. The fifteen-minute programs are designed for the lay public, and are produced with the cooperation of the Massachusetts Medical Society and the Massachusetts Hospital Association.

Dr. LeRoy A. Schall, Chief of Otolaryngology, talked on "Sinusitis" in January. Dr. Virgil G. Casten, Surgeon in Ophthalmology, appeared on the March 3 program, speaking on "Strabismus"; and the following week, Dr. Donald K. Lewis, Associate Surgeon of the Winthrop Foundation, discussed "Poor hearing". The interviews were presented in lay terms, and visual material, such as charts, illustrations, and models, was introduced to take advantage of the television medium.

The Board of Managers have announced the promotions of Dr. Henry A. Mosher and Dr. Karl Riemer from Assistants in the Department of Ophthalmology to Assistant Surgeons.

Recent visitors from abroad were Dr. P. Feldman of Calcutta, India, who was particularly interested in the work of the Department of Otolaryngology, and Dr. Alfred Diab, Professor of Otolaryngology at the American University of Beirut, Lebanon.

This note has come from Dr. James Lincoln Huntington (*S. S.* 1908):

> I have retired from the practice of obstetrics and gynecology to accept a full-time position with the Blood Mobile Unit of the American Red Cross at the sub-station for Western Massachusetts, at Northampton.

This letter, dated February 19, came from Lt. Hermes C. Grillo, MC, USNR (*S.* 1948), from the U.S. Naval Hospital, St. Albans, Long Island, N. Y.

> Must record another change of address — as above — where I am enjoying duty on a very active Thoracic Surgery Service. I hope this will be my last change of address before returning to M.G.H.
>
> I shall look forward to receiving The News here with as much pleasure as at my previous (and somewhat more remote) mailing address — the First Marine Division, Korea.

A postscript, typed in red, is added to each renewal notice we send out, asking for at least a brief note from our subscribers concerning their present interests and activities. The results have been most discouraging to your editor, who tries to report at least once a year on every member of the MGH family. Therefore, we are very grateful to Dr. Clayton H. Hale (r.p. *R.* 1943) for his response to our appeal. Although his message is brief, it indicates a kind consideration of our endeavor, and for that we thank him. Dr. Hale writes:

> On June 1, 1951, I was appointed Professor and Director of the Department of Radiology at the New York State Medical Center at Syracuse.

It pleased us very much to receive this interesting letter from Dr. James Cortázar (gr. stud. a. *M.* 1951). He gives Calle 48 #9-29, Bogotá, Colombia as his home address—office address not definite, as yet. His letter reads:

> The last six issues of The News reached me in Colombia, my country. I know that the mail's cost per year is greater than the amount I paid for my subscription, so I am enclosing a check for $5 instead of $2 in order to continue receiving that excellent publication for another year, this time paying the just amount.
>
> There is nothing much to tell about my activities, because everyone is on an intermediate step. In hospital work I am at the Endocrinology Department of the National Radium Institute and, because of the relation of radium with radioactive isotopes, I also handle Ra. In the future there will be a Radioactive Iodine Department and I will be with it.
>
> Teaching activities are irregular for me now, but soon they will become regular with graduate students studying general endocrinology and radioactive isotopes.
>
> I presented a paper (I-131 and thyroid gland) to the Colombian Society for Endocrinology. They accepted it, and also my name as a member. In that way my private practice is starting as Endocrinologist and Thyroidologist.
>
> Of course, my gratitude to the Thyroid Clinic, and to Drs. Means and Stanbury in particular, is boundless. I wish I could still be there.
>
> The AEC invited me to a course on Nuclear Physics in relation with Medicine. I don't know just when it will be, but if I go I will certainly visit the M.G.H.

THE MASSACHUSETTS GENERAL HOSPITAL 1811 NEWS

No. 112 Boston, Mass. May 1952

THE TENTH BIRTHDAY OF THE BLOOD BANK

On April first the Blood Bank completed ten years of service. As this date is a milestone, perhaps we would do well to review the Bank's history.

The first blood bank in the world was started by the English army during World War I. The first one for civilian use was started by the Russians in the early 1930's. Cook County Hospital opened the first American blood bank in 1935. City hospitals entered this field early for purely economic reasons, as previously they had paid large sums of money to professional donors. The city of New York adopted a system of blood banks for its twenty-six municipal hospitals in 1938. It was estimated that these banks would save the city a million dollars a year.

For private hospitals such as this there was no financial problem to be solved by having a bank; but the proponents of a bank for the M.G.H. felt that there was a real need to have blood on hand for emergencies, that the donors were seriously inconvenienced by the system in vogue, and that the house staff had to spend too much time collecting and typing blood.

The opponents, who were in the majority, felt that banked blood was inferior to freshly collected blood, and there the matter rested until March of 1942. At that time the ranks of the opponents had become seriously depleted because of defections into the armed forces, so Dr. Tracy Mallory was able to obtain approval for a blood bank.

The Bank opened in the cellar of the Moseley Building on April 1, 1942, in a hot and dusty area no longer usable for the care of patients. The staff consisted of one nurse, one technician, and a part-time maid, all supervised by a doctor.

In the beginning everything went wrong. The blood clotted and would not pass through the commercial filters. The rate of pyrogenic reactions was often as high as 12%. Only because of the hopeful tolerance of the General Executive Committee was the miserable organization allowed to continue its existence. Within three months, prefiltering through stainless steel filters had been introduced, clots were completely eliminated, and the reaction rate fell to 2%. Similar filtering methods have since been adopted by many other hospitals.

With the whole-blood problem somewhat solved, the Bank turned itself to the production of plasma needed for treating burns and for stockpiling for civil defense. The administration, having already spent $5,000 in equipping and refurbishing the Moseley basement, told the Bank that if it was interested in such nonsense it would have to raise the money by itself. Because of the generosity of a number of persons the money was raised, a refrigerator and other equipment purchased, and the Bank went into the plasma business. The effort paid off with unexpected rapidity. In November of 1942 the Hospital was flooded with victims of the Cocoanut Grove disaster. The Bank had more than enough plasma to give the patients adequate care. This single episode swept away the last of the opposition to the Bank and it became firmly established as a necessary part of the Hospital.

In its first year the Bank introduced a number of changes. The first of these was a vast improvement in the care of the donor. Under the old system he made one trip to the Hospital to be typed, and another, usually at an inconvenient hour, to have his blood drawn. Under the new system he made but one trip and that at an hour of his own selection. Furthermore, he had a history and a physical examination done by a doctor and his hemoglobin checked by a technician before phlebotomy. Afterward, he was given a rest period on a cot, was fed, and again checked to be sure he had recovered before leaving. Throughout his stay in the Bank he was handled with great courtesy by a group of volunteers who have, from the start, played a very important role in caring for the donors as well as making them feel that their donations are appreciated. Many of the Bank's volunteers have served for quite a few years. Their services are an invaluable part of good care of the blood donor, a field in which this Hospital has been one of the pioneers.

Next, the whole system of blood grouping and cross-matching was removed from the hands of the most junior member of the house staff and was put in the hands of trained technicians. Everything was double checked by two individuals, a safety measure which this Hospital was one of the first to adopt. The Moss system of bloodgroup identification was then in vogue here, but because the International system of Landsteiner was more acceptable scientifically as well as being the government standard, it was decided to change to it. This change was brought about gradually by labeling blood at first with both the Moss and the International codes, then gradually abandoning the Moss label. In this way a complete change-over was effected without any open outcry by the adherents to the Moss method.

A debit and credit system was set up for the wards to ensure an adequate supply of blood, which has always been on a strictly one-for-one replacement basis. For the private patients a charge was made for blood not replaced and the money so collected was used to purchase blood from professional donors. This system worked well, kept up the blood supply on hand, and allowed for purchase of blood in the groups in which the Bank was low.

Another improvement was that of having the patients typed well in advance of the time of transfusion so that the laboratory work could be carried out as an unhurried routine, rather than in a last minute rush fraught with inaccuracies.

The most important advance from the point of view of patient safety was the insistence that blood be cross-matched and ready for use in case of any major operation, so that if hemorrhage should occur in greater amount than anticipated, blood would be ready for transfusion.

At the end of the first year the Bank was operating financially in the black. It had paid off its original cost and had an ample reserve of plasma.

During the war years the Bank was run by Dr. Carroll Miller. Despite a very heavy load of work, constant problems of changing personnel, and an increasing rate of transfusion, he did a very good job of management.

By 1946 the Bank staff had increased considerably and the Hospital transfusion rate had trebled. The latter was largely due to the fact that more radical surgery had become safe, once blood was available, and hence more and more advanced surgery was going on, requiring more and more blood. In this same year, at the suggestion of Dr. Charles Mixter, Jr., the Bank took on a full-time secretary whose job it was to call donors. Her work in the first year increased the excess of blood donations over transfusions from 2% to 10%. Also in 1946 the autotransfusion set was gradually perfected so that blood could be drawn quickly and effectively. This set had been adopted in a number of other hospitals. Other postwar problems have been mostly a result of the changing needs of surgery, the expanding use of blood, and discoveries of new blood groups.

The failure of the clotting mechanism, common among certain individuals with diseased livers after they have been given large amounts of banked blood, was one of the problems which was solved by this Bank with the help of Dr. Robert Linton, before the mechanism of such failure was known. The attack on the problem was first to use direct transfusions when clotting ceased. This was effective, so fresh citrated blood was next tried. This worked equally well and has been used ever since.

Emergencies at night were not taken care of with sufficient speed after the war because of inadequacy of the Bank's staff. After considerable pressure from the Obstetrical Service, the Hospital permitted the Bank to hire night technicians. A more satisfactory system of coverage was developed by employing medical students. These students, seven in number, give full-time coverage for emergencies only. Their employment means that there is always someone in the Bank except at mealtimes on the week ends.

Rapid infusion of blood is becoming of increasing importance in the operating room; before the war this was handled by using a three-way stopcock and a syringe. Such a method is too slow for patients bleeding severely, hence this Hospital sponsored a small rotary hand pump attached to the tubing for the rapid infusion of blood. This pump was designed by Mr. Bruckmann, a graduate of M.I.T., and is now being manufactured by the American Optical Co. for this and for other hospitals. It is the safest method of pressure transfusion for both intravenous and intra-arterial use.

The Bank has assisted Dr. Trygve Gundersen, Surgeon in Ophthalmology at the Massachusetts Eye and Ear Infirmary, in his treatment of patients who have herpes zoster of the trigeminal nerve by providing him with immune plasma from patients who had recovered from the disease. This treatment has been an effective measure in preventing corneal ulcerations.

In 1949 the Bank moved to its present quarters in the Domestic Building.

The most serious problem for the Bank has been one of management. In 1942 it became apparent that the highly technical skill required in investigating certain kinds of blood incompatibilities, particularly those associated with the Rh factor, was not available in our Hospital. Hence, the Bank insisted on becoming a part of the Boston Blood Grouping Laboratory, directed by Dr. Louis Diamond, so that it could avail itself of the skills available there. This has proved to be an excellent arrangement. Although the administration demurred at first to the yearly membership fees of $300 to $500, the Bank has received in return not only many investigations of blood incompatibilities free of charge, but the yearly salaries of three different research fellows, a Beckman spectrophotometer, and about $20,000 worth of testing serum.

After the war, however, the medical coverage by a part-time doctor who could refer his problems to the Blood Grouping Laboratory was not enough. The rate of transfusion and the constantly increasing difficulties with new and rare blood groups demanded full-time medical coverage. After exploring several possibilities the Bank took on a series of fellows for a year or more. This was a temporary but only a partially effective expedient. By 1950 the Bank was giving five times as many transfusions as in 1942. Many new tests had been introduced. Careful supervision of technicians was needed. Investigation of each blood incompatibility required many hours of investigation by a highly competent specialist.

In nine years' time blood banking had changed from being an element of clinical pathology to becoming a highly esoteric specialty all its own; the Blood Bank had grown from a refrigerator vaguely under the suzerainty of the head of the Pathology Department to a vigorous independent department. To meet this need Dr. Morten Grove-Rasmussen, who had spent a number of years in training both at this Bank and at the State Serum Institute in Copenhagen, took on the full-time job of assistant director of the Bank. His appointment is the biggest step forward that the Bank has taken. It means that there is now available in the Hospital an expert in blood grouping and blood banking techniques, the peer of anyone in this country or abroad. It means increased safety of our laboratory work and a new era of investigation in this field where we have always had abundant material for study but no one, heretofore, who could study it. Since his arrival the Bank has already accomplished a number of things.

First, he has set up a "cell panel". In its simplest terms, this is the mechanism for identifying the blood sub-group, Rh factor sub-group, or rare blood group to which a patient has been previously sensitized by pregnancy or transfusion. This "panel" was set up with the help of the Boston Blood Grouping Laboratory and by using material contributed by other laboratories in this country, England, Holland, and Denmark. This "panel" fills a vital need in solving problems of blood incompatibility in the laboratory so that patients may receive blood which will not give them a hemolytic reaction.

Second, he has been able to improve and extend the manufacture of blood testing serum so that we are now able to supply commerical laboratories with high grade testing sera of different types. In return for this, the Bank obtains other testing material free of charge. Worked out in dollars and cents, this means a considerable reduction in the operating costs of the Bank each year. Such a saving means a reduction in the cost of service to the patients and also a lessened expenditure by the Hospital. This saving, in summary, is considerably greater than the salary paid to Dr. Rasmussen. It has also meant that we have been able to stockpile testing sera for civil defense purposes at no expense to the Hospital.

Third, he has been able to conduct research of direct value in the care of patients. Among other things, he has identified a hitherto unknown sub-group of type A.

The Bank has also taken over the supervision of the solution room and of the nurses who administer intravenous therapy. This means a coordinated system of intravenous and transfusion therapy under a single director. Many minor changes have taken place as a result of this, changes which have, in many instances, been instituted as a direct result of suggestions from house staff and nurses. The most important of these changes has been the adoption of a policy of equipping the wards with their daily supplies, on a quota basis, during the latter part of the day. Young Harvard students bring back to central supply the dirty equipment, and replace it with fresh materials up to the amounts that the wards require. This means that the wards start each day with enough supplies for the day's work, the central supply room has all of its dirty equipment ready for cleaning when it opens each morning, and transportation is done by unskilled persons instead of by over-worked nurses. It has also resulted in a considerable saving of equipment previously lost or discarded.

The last of the changes introduced after the war was the establishment of a Bone Bank in 1950 within the confines of the Blood Bank. Fresh bone removed in the operating room from patients free of transmissible diseases, which ordinarily would be discarded during an operation, is now stored for future use. It is largely used in orthopedic operations when fresh autogenous bone is unavailable. This has been a considerable boon to many patients.

Present status of the Blood Bank

At the present time the Blood Bank is an independent department of the Hospital, integrated with the other departments through its director and the Blood Bank Committee. It is now the largest hospital blood bank in New England and one of the largest hospital banks in the country. It provides as complete laboratory investigation of transfusion and certain other hematological problems and as complete a transfusion service as is obtainable anywhere. It acts in an advisory capacity to the Hospital staff on the problems of individual patients.

In addition to its functions within the Hospital it has taken a vigorous part in the transfusion problems of the community. It has endorsed the state-wide Red Cross blood program from the start. Through the Massachusetts Medical Society and the Red Cross Advisory Committee it has done its share in helping that program to function.

It has helped, along with other large banks, in the establishment of a blood clearinghouse for exchange of blood between hospitals, in providing further training for personnel of other hospital banks, and, finally, in the revision of the State Public Health regulations governing the use of blood. It has trained personnel and helped to set up a number of banks in this State, in other States, and in other countries. From the start this Bank has exchanged blood freely with other hospitals so that no one anywhere in need of a transfusion would fail to receive it if we had the blood on hand. Through the State Civil Defense Agency this Bank has participated in the setting up of a system for providing blood and blood substitutes after a disaster.

It has joined other banks in founding the New England Association of Blood Bank Directors, an organization devoted to the improvement of transfusion therapy. It is also a member of the American Association of Blood Banks. It is affiliated with the Blood Bank of the Chelsea Soldiers Home, making the facilities of a large bank available to a hospital whose bank is too small to provide them adequately. It has cooperated with the Post Office employees, veterans' organizations, and others in providing blood for their members.

Plans for the future

In the near future the Bank will need to improve further its service to the Hospital by a number of changes. These include (should a centralized operating room suite be constructed) a new site for its laboratories and storage facilities in close juxtaposition to the operating rooms. Also, a less cumbersome method of blood distribution would be of great service to the doctors and to the ward personnel. The Bank needs to carry out research in many of the problems facing blood banks. It also will have to obtain satisfactory plasma substitutes for use in treating nonhemorrhagic shock.

No change is at present contemplated in its internal workings. Blood collection has been very well handled by the nurses, laboratory work by the technicians. The direction is in the hands of a surgeon, assisted by a highly-trained expert in the field of blood grouping. This seems at present to be a good balance between the clinical and laboratory aspects of transfusion therapy. Because 90% of the blood dispensed is given to surgical patients, it has seemed wise that the clinical problems of the Bank should remain under the direction of a clinician who is in close contact with the surgical patients.

Statistics

The following points are of no medical importance, but only serve to inflame the imagination: Since its start, the Blood Bank has always operated in the black as far as the Hospital's financial structure is concerned. This does not take into account the free service to patients (sometimes 50% in the General Hospital), but does include hospital overhead. The Bank has never lived within its budget, having spent in its early years sometimes as much as three times the amount allowed. The budget for 1942 was $5,000. In 1951 the Bank spent $144,000. It costs the Bank $8.58 to dispense a transfusion, the larger part of this expense going for the salaries of nurses and technicians.

The transfusion rate for this Bank is about 12,000 a year at present. The largest number of transfusions it gave to a single person was 122; the largest number of transfusions given to a single person in a short period of time was 56 in 3½ hours (the latter includes autotransfusions).

At present 30% of the blood that is dispensed comes from the Red Cross, one-quarter from professional donors, and the rest from friends or families of patients.

In ten years the Bank has dispensed over 84,500 transfusions of whole blood and 4,246 transfusions of plasma. During that time it has had two deaths from mismatching. The national death rate from mismatched transfusions is between 1:500 and 1:3,000. The Bank has given out blood at the average rate of a transfusion per hour for ten years. In 1951 it gave out one blood every three-quarters of an hour. The total weight of blood dispensed is 22 tons, or in liquid measure 10,000 gallons. If spread in a band one millimeter thick and one centimeter wide it would twice girdle the earth with a ribbon of red.

Lamar Soutter, M.D.,
Director of the Blood Bank

* * *

Dr. Walter S. Burrage, Associate Physician on our staff, was elected President of the American Academy of Allergy at its Annual Meeting in Chicago on February 20.

Dr. Benjamin Castleman, Acting Chief of our Department of Pathology and Bacteriology, spent the first two weeks of March in Bogotá, Colombia, at the invitation of La Sociedad Colombiana de Medicina Interna and the Universidad Nacional de Colombia. He delivered six lectures and conducted three clinicopathological conferences (MGH cases discussed in Spanish).

Another MGH Case Records Club, of twelve physicians, was discovered in Bogotá, called Martes Orquideas (Orchids on Tuesday), named after a Spanish movie film in which a husband sends his wife an orchid every Tuesday when he does not return home. These physicians discuss a case record every Tuesday but, although orchids are very plentiful there, it could not be ascertained whether their wives receive them every Tuesday.

Word has just come to us that on March 18 Dr. Edward D. Churchill, Chief of our General Surgical Services, was elected Correspondant étranger dans la deuxième Division (Chirurgie, accouchements et spécialités chirurgicales) of the Académie Nationale de Médecine, Paris, France.

Dr. Dean A. Clark, our General Director, was elected President of the New England Hospital Assembly at its Annual Meeting in March.

Dr. Horatio Rogers, Visiting Surgeon at M.G.H., was recently appointed Chairman of the Professional Educational Committee of the State Civil Defense Agency.

On March 17 (Miss Sleeper's birthday, incidentally) ground was broken in the southeast corner of the Bulfinch Yard for a new residence for student and graduate nurses. The building, which is to have 9 floors, is planned to accommodate 155 persons, including a residence director. The basement will provide space for laundry and trunk storage. The first floor will include the more formal social rooms. The roof will be enclosed to make a game room. The 7 bedroom floors are to be divided into 3- and 4-room suites, each with its own bath. On each floor will be a sitting room, with kitchenette and laundryette, opening onto a small sun porch. Included in the building plans is the removal of the Fruit Street section of the brick wall enclosing the Bulfinch Yard, and the placing of gates at the junctions of Fruit Street with Blossom, Parkman with North Anderson, and Fruit with North Grove.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to The News.

The following new titles have been received:

Dermatology

Lever, W. F.
Pemphigus vulgaris.
In Current therapy, Howard F. Conn, M.D., Editor, Philadelphia, W. B. Saunders Company, pp. 569-570.

Neurology, Neurosurgery, and Psychiatry

Cobb, S.
On the nature and locus of mind.
A.M.A. Arch. Neurol. & Psychiat. 67:172-177.
Cobb, S., and Miles, H. H. W. (Editors)
Diagnostic and therapeutic problems in a patient with epilepsy, psychosis and temporal lobe abnormality.
Am. J. Med. 12:238-243.

Pathology

Longcope, W. T., and Freiman, D. G.
A study of sarcoidosis.
Medicine 31:1-132.

Books

Benda, C. E.
Developmental disorders of mentation and cerebral palsies.
New York, Grune & Stratton.
Cobb, S.
Foundations of Neuropsychiatry, 5th edition.
Baltimore, Williams and Wilkins Company.

Case histories in Psychosomatic Medicine.
New York, W. W. Norton & Company, Inc.

Miscellaneous

Castleman, B.
Tracy Burr Mallory, 1896-1951.
Harvard Med. Alum. Bull. 26:66-68.

MASSACHUSETTS EYE & EAR INFIRMARY

The Alumni Meeting of the Massachusetts Eye and Ear Infirmary was held at the Hospital on April 16, in conjunction with the New England Ophthalmological Society Meeting on the 15th of April and the New England Oto-Laryngological Society Meeting on the 16th.

Infirmary staff members, alumni, and guest speakers presented papers and participated in group symposia during the two-day conference. Clinic sessions, both surgical and diagnostic, were conducted by Infirmary doctors in the operating rooms and out-patient clinics.

Among the guest speakers were Dr. Hugo L. Blair of the Mayo Clinic, who talked on "Basic aspects of visual field study" and Dr. Jerome Hilger of St. Paul, Minnesota, who presented "Recent concepts and newer therapy in Otorhinolaryngology".

At the Alumni Dinner, on Wednesday evening, Mr. Henry Hixon Meyer, President of the Board of Managers, spoke on the present and future objectives of the Infirmary, including particularly the Hospital's research and teaching programs. Special guest speaker of the evening was Mr. Thomas Scott, who discussed "Red China".

The Executive Committee of the Board of Managers has announced the appointment of Dr. Edwin B. Goodall, as Assistant in Ophthalmology.

Dr. Bernard Zeavin and Dr. Peter Beck began their residencies on the Ophthalmological Service on April 1. Dr. Zeavin is a graduate of University of Manitoba, Faculty of Medicine. Dr. Beck studied at the College of Physicians and Surgeons, Columbia University.

Dr. Merrill I. Lineback completed his residency in Otolaryngology on March 31. He has returned to Atlanta, Georgia, for private practice.

Dr. Paul A. Chandler lectured recently in Roanoke, Virginia, at the twenty-fifth Annual Spring Congress of the Gill Memorial Eye, Ear, Nose and Throat Hospital.

The Board of Trustees, at their meeting on April 4, voted to appoint:

Dr. Mustafa I. Adham as Acting Assistant Resident on the Surgical Service for four months, beginning March 1;

Dr. Abdus-Sattar Adi as Acting Assistant Resident on the Surgical Service for four months, beginning March 1;

Dr. Alexander Forbes as Consultant in Neurophysiology;

Dr. Robert N. Ganz as Assistant Physician on the Children's Medical Service;

Dr. Thomas J. Mathieu as Assistant Resident in Urology from September 1 through December 31, 1952, and as Resident in Urology from January 1 through December 31, 1953;

Dr. John Schaefer as Assistant Resident in Anesthesia, beginning May 1;

Dr. Marion L. Slemons as Clinical Associate on the Children's Medical Service;

Dr. Clifford J. Straehley, Jr. as Resident in Urology from July 1 through December 31;

Dr. Daniel L. Sutherland as Second Assistant Resident in Neurosurgery from March 1 through June 30.

The Trustees also appointed the following Interns for one year, beginning July 1:

Surgery

John D. Constable
Richard R. Curtin
Ira A. Ferguson, Jr.
Donald J. Glotzer
William H. Hendren, III
Charles E. Huggins
Benjamin B. Jackson
John A. Malcolm

Medicine

(subject to the approval of the General Executive Committee)

John T. Binion
Beverly W. Cobbs, Jr.
Herschel D. Collins
Garth R. Drewry
Hugh R. Dudley, Jr.
Patricia A. McIntyre
William L. Morgan, Jr.
James A. Pittman, Jr.
Howard Rasmussen
Kenneth J. Ryan
John B. Thomas
Yang Wang

Children's Medical Service

(subject to the approval of the General Executive Committee)

Susanne J. Lamdin
Robert B. Rosen

At their meetings held on March 14, 21 and 28, and April 4, the General Executive Committee voted:

To accept the resignation of Dr. James L. Buchanan from the position of Clinical Assistant in Surgery, effective as of May 1;

To accept the resignation of Dr. Frederic B. Mayo from the position of Clinical Assistant in Medicine, effective as of June 1;

That Dr. Jean Lepoire's appointment as Second Assistant Resident in Neurosurgery be terminated as of February 29 and that he be reappointed to the position of Research and Clinical Fellow in Neurosurgery, from March 1 through September 30.

To appoint:

Dr. André d'Etchéverry as Clinical Fellow in Radiology for one year, beginning July 1;

Dr. George S. Klein as Research Fellow in Psychology, assigned to Neurosurgery, effective as of March 27;

Dr. John B. Löfstrom as a Fellow in Anesthesia for one year, beginning October 1;

Dr. Rosemary T. Nelson as Clinical Assistant in Surgery, assigned to the Tumor Clinic, effective as of April 1;

Dr. Robert M. O'Neal as Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Julio Toriello as Clinical Fellow in Radiology, effective as of April 25;

Dr. Armand Trepanier as Clinical Fellow in Radiology for one year, beginning July 1.

* * *

STAFF WIVES

All MGH Staff Wives are urged to attend the next regular meeting on Wednesday, May 7, at 1:15, in the Archives Room of the Moseley Building. Members who can come early are invited to meet for lunch at noon in the Nurses' Cafeteria.

At the April meeting a progress report was given by the committee appointed to participate in decorating the House Staff Club rooms. Books and phonograph records were collected at morning coffee parties the last week in April in six suburban communities. "Open house" in the Club is planned for early in May.

Mrs. Richard Sweet reported on the surgical dressing group. Doctors' wives have worked each Thursday morning on the ninth floor of the White Building since the middle of February. Mrs. William Waddell, Mrs. Mary Low Taylor, and Mrs. Allen Brailey have made many supplies in their homes. Mrs. Thomas Gephart invited Staff Wives of Newton to make dressings in her home. These supplies are urgently needed, and whatever can be done will be much appreciated.

Mrs. Fritz Lipmann will work with representatives of the Distaff Club and the Ladies' Visiting Committee on housing. Please telephone her at Lafayette 3-5292 if you wish to make your home available to a House Staff family during the summer or at any time you may be away.

Mrs. Charles Kubik will welcome suggestions regarding a supply of seedlings to be sold at the School of Nursing's Flower Shop.

Mrs. Milford Schulz (Belmont 5-1232) is enlisting the help of Staff Wives and others interested in music. She is working with Mrs. Cushing of the Baker Memorial, whose organ music in the Chapel has been enjoyed for many years. Mrs. Cushing gave several organ concerts during Easter week.

Mrs. Walter Bauer reported on the April meeting of the Coordinating Committee. Staff Wives who can devote two hours a week to hospital volunteer work are urged to telephone Mrs. Jack Fife Wright (Lasell 7-0083) or Miss Banks (Lafayette 3-2667), Head of the Rehabilitation Clinic. This Clinic serves civilian adults who have become handicapped by accident or by disease. Here the patients are taught to use the abilities they have left and, therefore, to become more independent. More volunteers are needed to assist the physical and occupational therapists and the rehabilitation counselor.

* * *

A RECENT MEDICAL VISIT TO THE MIDDLE AND NEAR EAST

Early in December I was asked by the State Department to go to Pakistan on a special mission under the Point IV Program. Other consultants were being sent to Pakistan and other countries in South Asia as part of this same program in various fields, including public health, education, agriculture, economics, and engineering.

My mission included several functions. The first was to visit the new medical schools, called medical colleges, which had been established since the liberation and partition in several important centers in both West and East Pakistan. Some of these new medical colleges I visited, in particular the Dow Medical College in Karachi, the Fatima Jinnah Medical College for Women in Lahore, and the Dacca Medical College in East Bengal. I also visited the older King Edward Medical College in Lahore. Other, still newer, medical colleges at Multan and Hyderabad I did not see. The courses at these medical colleges have a duration of five years and will be followed soon by one or two years of internships in the newly developed and growing hospitals. Each class comprises, as a rule, 120 students, making a total of 600 in each school. At each of the medical centers I gave several lectures on cardiovascular subjects.

The second function was that of visiting the major hospitals in Pakistan. These included the hospitals in the larger centers, the main military hospital at Rawalpindi in the Punjab, and several hospitals at Peshawar near the Khyber Pass in the Northwest Frontier Province, including a very fine new construction for tuberculous patients. In East Bengal I saw a small village hospital at Narayanganj which is typical of many of the smaller hospitals in Pakistan and I suppose also in India, needing reorganization and improvement.

The third activity in which I took part was that of the appraisal of facilities for cardiovascular research in Pakistan. I found a number of alert and well-trained young and older physicians, capable of carrying on research, and suggested the development of an active Medical Research Council and an initial research to start off with, which might determine the prevalence of the different types of heart disease in various community groups (poor and well-to-do) in both East and West Pakistan.

Fourthly, I was asked to try to determine the feasibility of arranging for a medical teaching mission or other type of educational aid for Pakistan and India in the relatively near future.

Finally, I found myself involved in the examination of a good many private patients, usually in the evening after the regular program of the day had finished. These private patients afforded me a good deal of information about the incidence of diseases among the well-to-do people in the country, at the same time that I was being shown the kinds of diseases from which the public patients in the hospital wards suffered. The problems of infections and dysentery are still very common. In East Bengal I saw several patients with cholera and kala-azar.

Before my departure from Pakistan I had a conference with the Governor General, an old friend and patient of mine, together with some of his public health officials, concerning my impressions of this most interesting tour of the country.

My visits to the hospitals, examinations of private patients, and conferences with the doctors of the various provinces of Pakistan and in India made me aware of the great frequency of heart disease in that part of Asia, a fact that had been ignored or at least misunderstood only a relatively few years ago. The rheumatic heart cases seemed to be mostly among the poor people in the hospital wards and in the villages. Rheumatic heart disease is said to be the commonest type of heart disease now in both Pakistan and India. On the other hand, I found a considerable amount of coronary heart disease and hypertension among the private patients, and relatively little in the wards. I saw two men in Pakistan who had had coronary thrombosis in their thirties and one young man at New Delhi in India who was recovering from acute coronary thrombosis at the age of 29.

In the midst of my visit to Pakistan I crossed India in order to reach East Bengal. On my way back I stopped in New Delhi in India, where my wife joined me for the last part of my expedition. There we were guests of the Minister of Health, Rajkumari Amrit Kaur, a gifted woman who had been secretary to and a close friend of Ghandi. She told us of some of the serious problems of health in India today, which include the presence of one million lepers in the country and the deaths of 500,000 Indians yearly from tuberculosis, with only 18,000 beds available for tuberculous patients, though even this is an increase of 12,000 beds in a relatively few years. In passing through some of the small villages in India we saw a good deal of malnutrition. We felt that some of this might be counteracted by a change in the customs of the country with respect to the sacredness of cattle and monkeys. Although I visited the Lady Hardinge Medical College at New Delhi, lectured, and saw a few patients, our stay in India was too short for adequate impressions about the medical situation there.

On our return west we visited briefly the American University and Medical School at Beirut, where I saw its new hospital construction. Also, we spent 48 hours in Jerusalem on a special mission to the Hadassah Medical School and Hospital; this had been requested by the Hadassah Medical Organization. There I made ward rounds, which were much enlivened by very alert medical staffs, and gave a lecture. From there we proceeded by way of Cyprus to Athens, where again we stopped for three days to renew acquaintances with the Greek medical faculty and to appraise the considerable improvements in medical care and teaching that were evident, in contrast to the difficult dark days of the guerrilla warfare at the time of the 1948 visit of the Unitarian Service Committee's Medical Mission which included Dr. Chester Jones and me among its members. I revisited a number of hospitals in Athens and the classrooms and laboratories of the University's Medical School, gave two more lectures, and saw a number of private patients. There, as in Pakistan and elsewhere, I found a considerable prevalence of hypertension and coronary and rheumatic heart disease. Finally, a brief stop-over in Rome permitted a reunion with a number of our cardiological friends living there and in Bologna; this was arranged by Drs. Puddu and Posteli who have visited us here at the Hospital in recent years.

In retrospect now, I believe that this visit to the Middle and Near East served a useful purpose.

Paul D. White, M.D.,
Board of Consultation

MEDICAL VISIT TO THE FAR EAST

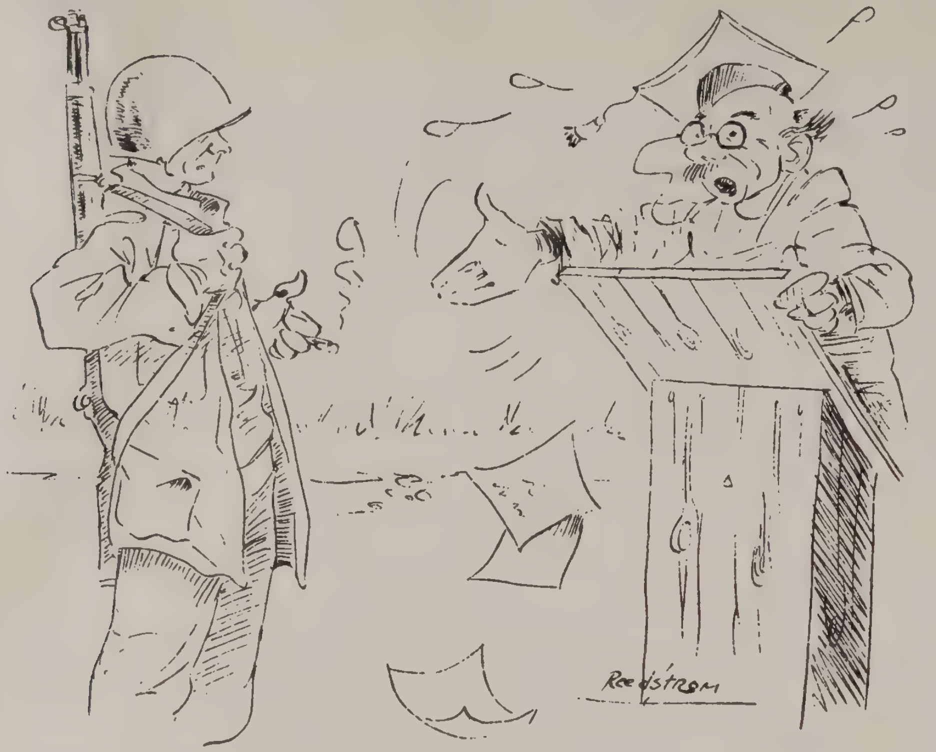
It was confusing to return from a second trip to the Far East as Consultant for the Surgeon General of the Army and find that Boston had had more snow than Korea, that patients previously bedridden with tuberculosis were now dancing in the corridors, and that I myself was being considered a fit subject for study by the U. S. Senate because I was standing in the way of medical progress. Consequently there has been a delay in the attempt to summarize my impressions of the present state of affairs in Japan, Korea, and Okinawa, and the Editor is pushing for my promised observations.

It should be stated first that this trip was a "teaching mission", and not one of a scientific study of problems of military medicine or of inspection of Army hospitals. The teaching was much more carefully planned than at any time before, I believe, and a good part of the time was taken up in attending and taking part in "regional medical conferences". Often I was the only speaker at a conference lasting from two to six hours, and again there would be many other speakers from different parts of the theatre. The attendance varied from forty to two hundred fifty. The most pretentious program was a three-day Postgraduate Refresher Course on "Current concepts in the diagnosis and treatment of diseases of the chest", held at Pusan, Korea. Altogether there were twelve conferences, at seven of which I had no supporters. (I didn't say "no audience".) Besides, there were two talks at Japanese medical schools, twenty "bedside conferences" in U. S. hospitals, and four other conferences with U. S. and Japanese doctors.

The territory covered in Japan was from Sapporo, in the northern island of Hokkaido, to Fukuoka, in the southern island of Kyushu; in Korea, up to and somewhat beyond the 38th Parallel; and much of the length and breadth of Okinawa. (It was a real honor to be made a charter member and honorary president of the 38th Parallel Medical Society.)

The most amazing hospital set-up was that of the combined 3rd and 14th Field Hospitals in Pusan. This hospital cares for the sick prisoners of war. There are about 7,900 patients behind barbed wire, and about 4,700 of these have pulmonary tuberculosis, with 600 with pleural effusion. The U. S. Army doctors are working through the Korean doctors and are doing a remarkable piece of work.

I was impressed, as always, with the high quality of the work in the Army hospitals everywhere. Of course, the young officers are restless and anxious to



Medical Missionary in Korea

pile up points enough to get home, but nevertheless the good work goes on.

There was little time to think of local medical problems, but I was much interested in the plans for further study of the fascinating new entity of "epidemic hemorrhagic fever", and in the success of the new boot in warding off cold injuries. I was disappointed to see that little progress had been made in the handling of infectious hepatitis since Fred Kranes shook his head over the problem in Italy in 1944 and 1945.

The problem of tuberculosis is constantly in the minds of the Army Medical Officers in Japan, because so many of the Japanese war brides are found to have X-ray evidence of this disease. According to our immigration laws, no immigrant with tuberculosis, even "tuberculosis – healed", can be admitted to the United States. In order for a suspected case of tuberculosis, even the wife of a U. S. soldier, to be admitted into the United States, the examining physician must sign a statement that the patient has "pulmonary fibrosis". Even after some months of observation, the conscientious physician has a hard time convincing himself of this state of affairs.

On the last visit I brought a typhoon to Okinawa. This time I escaped by two weeks a heavy earthquake in Hokkaido. So the Devil is still after me, but he'll have to run fast to catch me because I don't know where I'll go next. Maybe I'll stay at home a while and fool him.

Donald S. King, M.D.,
Board of Consultation

During his recent trip to Europe as Consultant to the Surgeon General of the Army, Dr. Edward F. Bland covered 2,400 miles by train, car, and plane in Germany and Austria. In Vienna Dr. Bland addressed a joint meeting of the Medical and Surgical Societies of that city at the University. His subject was "Progress in surgery for mitral stenosis".

BIOGLETS

Dr. Clement A. Hiebert, Intern in Surgery – born in Boston, Massachusetts, June 7, 1926; has spent most of his life in Maine; Navy Air Corps: Radar Technician, 1944-46; A.B., Bowdoin College, Brunswick, Maine, 1947; M.D., Harvard Medical School, 1951; at the end of his 3d year at H.M.S., went with two classmates to Notre Dame Bay Memorial Hospital, Twillingate, Newfoundland, for a summer internship; made house calls by fishing boat, dodging icebergs on the way; performed appendectomies, Cesarean section, tonsillectomies, and delivered twins on his first O.B. house call; father (deceased) was Superintendent of the Central Maine General Hospital and President of the New England Hospital Assembly; a brother is now serving as a surgeon with the U. S. Navy; 6 uncles and great-uncles include 2 general practitioners, a plastic surgeon, a radiologist, and a vice president of a drug house; home address: 240 College Street, Lewiston, Maine.

Dr. James P. Isaacs, Assistant Resident in Anesthesia – born in Struthers, Ohio, August 8, 1919; B.S., Ohio University, 1941; military service: U. S. Naval Reserve Hospital Corps, Pharmacist's Mate 1st Class, serving in the Southwest Pacific Theatre, 1942-45; Columbia Midshipmen's School, 1945; M.D., Johns Hopkins University Medical School, 1949; Surgical Intern, Johns Hopkins Hospital, 1949-50; William Stewart Halsted Fellow in Surgery, Johns Hopkins Medical School, 1950-51; home: Norwood, Massachusetts.

Dr. Hanna Klaus, 2d Assistant Resident in Pathology – born in Vienna, Austria, January 27, 1928; B.A., University of Louisville, 1948; M.D., University of Louisville, 1950; Intern, Louisville General Hospital, 1950-51; home: Louisville, Kentucky.

New addresses:—

Dr. Henry H. Banks (a.r.s. *Or.* 1952), Peter Bent Brigham Hospital, Boston, Mass.
Dr. Charles H. Burnett (c.r.p. 1946), School of Medicine, University of North Carolina, Chapel Hill, N. C.
Dr. Harrie R. Chamberlin (*C.M.* 1949), Grace-New Haven Community Hospital, New Haven 4, Conn.
Dr. Frederick S. Coombs (a.r.p. 1937), 803 Home Savings and Loan Bldg., Youngstown 3, Ohio.
Dr. Sanford T. Freedman (clin. asst. *Or.*), 483 Beacon St., Boston, Mass.
Dr. Arvil J. Hinshaw (*E.S.* 1947), Veterans Hospital, Houston, Tex.
Lt. Robert W. Hopkins, NC, USNR (*S.* 1948), U.S.S. *Repose* AH-16, c/o Fleet Post Office, San Francisco, Calif.
Dr. H. Walter Jones, Jr. (clin. asst. *M.*), 330 Dartmouth St., Boston, Mass.
Dr. E. Ross Mintz (*Path.* 1930 & r.s. *U.* 1932), 8 South State St., Concord, N. H.
Mr. Raymond S. Quick (res. fel. *Physics* 1952), Strong Memorial Hospital, Rochester 20, N. Y.
Dr. William C. Quinby, Jr. (r.s. 1950), 264 Beacon St., Boston, Mass.
Dr. Arthur S. Spangler (r.p. *D.* 1945), 330 Dartmouth St., Boston, Mass.

Brief bits:—

Dr. Walter S. Burrage, Associate Physician at M.G.H., presented a paper entitled "Maintenance cortisone in severe bronchial asthma" before the American Academy of Allergy at its Annual Meeting in Chicago on February 20. The paper had been written by Dr. Burrage and Dr. John W. Irwin, Clinical and Research Fellow in Medicine. On March 22 Dr. Burrage was guest speaker at the Annual Meeting of the Southeastern Allergy Association, held in Augusta, Georgia. His subject at that meeting was "Common sense in Allergy".

Drs. Parker C. Carson (r.s. *Or.* 1940) and Elmer F. Franseen (r.s. *Or.* 1947) announce the removal of their office to 38 School St., Springfield, Mass., for the practice of Orthopedic Surgery.

Dr. Edward F. Lawlor, Assistant Surgeon in Otolaryngology at the Massachusetts Eye and Ear Infirmary, announces the removal of his office to 67 Vernon St., Waltham, Mass.

Dr. Ellsworth H. Trowbridge, Jr. (a.r.p. *N.* 1940), who practises Neuropsychiatry and Electroencephalography in Kansas City, is organizing an epileptic clinic at the K. U. Medical School, where he is the Assistant Professor in Neuropsychiatry.

This short note has come from Dr. William R. Eyler (*C.M.* 1943 & r.p. *R.* 1949).

Some of your readers might be interested to know my present address, which is 55 East Washington Street, Chicago 2, Illinois.

I have an appointment at the University of Illinois as Assistant Professor and will be engaged in the private practice of Radiology in Chicago and Highland Park.

There is an accumulation of unclaimed articles in the Moseley Coat Room. Claimants may obtain their belongings by going to the Coat Room and offering proof of ownership.

Any items not claimed by June 1 will either be destroyed or donated to a charitable institution.

THE NEWS

No. 113 Boston, Mass. June 1952

NEUROLOGY SERVICE

The past year has witnessed several important changes; some of these can be viewed only with regret, and others may be looked upon with pride, for they assure a necessary growth and development in our department of medical neurology.

Dr. Charles S. Kubik retired as Chief of the Neurology Service on June 30, 1951, and the writer was appointed to fill his place. Dr. Kubik has been connected with this Service as both Neuropathologist and Neurologist since 1927. Through his untiring efforts the Neuropathology Laboratory, which he started in 1928, has been developed as an integral part of both the Neurology Service and the Pathology Department and is generally regarded as one of the finest in this country. A great wealth of neuropathological material has been accumulated and is available for the teaching of neurologists and for research. As Chief of Service he maintained a high standard of clinical neurology and of graduate training, often at personal sacrifice because of limited funds and personnel. Only those who have in the past served as residents or graduate students can fully appreciate how great this contribution has been. As Consultant in Neuropathology and a member of the Board of Consultation, we are fortunate in still having the benefit of his advice and counsel. It has been a unique pleasure this past year to have both Dr. Kubik and Dr. James B. Ayer, past Chief of Neurology and now a member of our Board of Consultation, at our weekly staff conferences.

The services of Dr. Henry R. Viets and Dr. Augustus S. Rose were lost to the Hospital during 1951. Dr. Viets, after a distinguished career in neurology, has retired, and Dr. Rose has been called to the University of Southern California at Los Angeles as Professor of Neurology. Dr. Vincent P. Perlo is on leave of absence, having entered the U. S. Army Medical Corps.

In the spring of 1951, through the combined efforts of the Massachusetts General Hospital and the Harvard Medical School, funds were secured from the National Multiple Sclerosis Society for the expansion of the research and postgraduate educational activities in the Neurology Service. We are happy to announce that the United States Public Health Service has agreed to support the research activities of our department for the next three years, beginning June 1, 1952.

The acquisition of these research funds has permitted several additions to our staff. Dr. Huntington Porter (Resident in Neurology at M.G.H., 1946) has joined the staff as a research fellow. His special interest is the biochemistry of neurological disease. He has been working with Dr. Folch-Pi at McLean on the fractionation of brain tissue and on copper metabolism. Dr. Byron H. Waksman has been transferred from the Neuropathology Department of Harvard Medical School to the staff of the Neurology Department as experimental immunologist. He is presently engaged with Drs. Folch-Pi, Porter, and Raymond D. Adams in the investigation of experimental demyelinative diseases. Miss Margaret Carroll has been added to the staff as tissue technician in the Laboratory of Experimental Neuropathology. Mr. D. Gaulitz assists Dr. Waksman as technician, and Mr. Juris Beggrovs is a technician working with Dr. Porter at McLean. Mrs. Ruth Simonds has joined the staff as secretary, and Miss Eulalia F. Grzebieniowska has been made executive secretary of the department.

New laboratories for Experimental Immunology, Biochemistry, Experimental Neuropathology, and Neurophysiology have been opened on Bulfinch 4.

The other members of the staff have continued their former activities. Drs. Robert S. Schwab, John A. Abbott, and Mary A. B. Brazier continue their electroencephalographic studies. Besides providing for routine electroencephalograms on patients in the M.G.H., they have carried on a number of investigations. Dr. Schwab has continued his studies of fatigue and of the pharmacotherapy of Parkinson's disease and myasthenia gravis. Moreover, he has published a monograph on the electroencephalogram entitled *Electroencephalography in clinical practice,* Philadelphia, W. B. Saunders Company, 1951. This book has been well received. Dr. Brazier has published an excellent monograph on neurophysiology: *The electrical activity of the nervous system,* New York, The Macmillan Company, 1951. The prominence of this group of clinical neurophysiologists is indicated by the fact that several research fellows are coming to the M.G.H. each year for special training in this field. In 1951 the following studied in this laboratory: Dr. Simon E. Markovich of Chile, Dr. and Mrs. Pierre Passouant of Montpellier, France, Dr. Ruth Jens of Salem, Oregon, and Dr. Alejandro P. Arellano of Lima, Peru.

Dr. Edwin M. Cole has continued his important work in Language Training and in "Cortical Testing". The activities of these two laboratories have been clearly defined in previous reports. I am pleased to say that these laboratories have continued to grow and the service which they render to the Hospital is appreciated by all who work in neurology and related fields.

The staff of the Neuropathology Laboratory has also increased in size. Dr. Edward P. Richardson, Jr., with the help of Dr. Adams, is in charge of the reporting on neurosurgical biopsies and the routine postmortem material, and Dr. Kubik serves as a consultant. Dr. Lysia Saxe of Copenhagen, Denmark, has been here for the past year as a Research Fellow in Neuropathology. She has been supported by a fellowship given by the American Association of University Women. Dr. Remedios K. Rosales has served as Resident in Neuropathology. Mrs. Klara Edwards and Mrs. Jean Engborg work as tissue technicians.

The Out-Patient Clinic and the Neurological Ward have been functioning at full capacity throughout the year. The census is not smaller than in past years, and is probably larger. Our close liaison with Ophthalmology, Medicine, Pediatrics, Neurosurgery, and Psychiatry continues.

Investigations and subclinics: Myasthenia Gravis Clinic – This is continued under Drs. Schwab and William H. Timberlake. The case material is abundant and permits the testing of new drugs for treatment of this disease. The Multiple Sclerosis Clinic – This meets once a week to diagnose cases suspected of having multiple sclerosis and to recommend treatment and management. Drs. Ruth E. Stauffer and R. D. Adams are in charge. The Epilepsy Clinic and a Parkinson's Clinic – These continue to meet once a week under the direction of Dr. Abbott and Dr. Schwab, respectively.

Because of the number of graduate fellows in neurology and neuropathology, our program of postgraduate training has been broadened. Drs. Schwab, Abbott, and Brazier held weekly seminars on electroencephalography during the autumn and early winter months. The weekly macroscopic neuropathology conference has been continued. One evening a week Drs. Richardson and Adams review the microscopic pathology of current cases in the Neuropathology Laboratory. A series of fifteen two-hour seminars on neuropathology has been given during the winter by Drs. Kubik, Richardson, and Adams. Dr. Paul I. Yakovlev has conducted ten evening seminars in neuroanatomy for the house staff and fellows of both the Neurological and Neurosurgical Services. The Thursday morning Ether Dome conferences have been continued, and an out-patient teaching conference is held each Friday at noon.

Steps are being taken to resume the publication of the staff books in which are recorded, indexed, and illustrated all of the cases presented at the weekly staff conferences.

The second and third year neurology lectures for the Harvard students are given as in previous years, also the third year section teaching. Approximately one-third of the fourth year class are taking a month of neurology as an elective, either at the Boston City Hospital or the M.G.H.

In general, the writer is optimistic over the future prospects of our Neurological Service. The Director and Trustees of the Massachusetts General Hospital and the Dean of the Harvard Medical School have been extremely helpful during this period of transition, and we feel confident of their future support. We now have the means of making an important contribution to undergraduate and postgraduate education in neurology and of investigating neurological problems on a larger scale than has hitherto been possible. We hope to maintain the reputation the Service has had for a high standard of clinical neurology.

Raymond D. Adams, M.D.,
Chief of Neurology Service

* * *

Lt. Hermes C. Grillo, MC, USNR (*S.* 1948) has been awarded the Navy Commendation Medal with Combat V for excellence in the line of duty. Lieutenant Grillo, whose present address is U. S. Naval Hospital, St. Albans, Long Island, N. Y., served with the First Marine Division in Korea.

* * *

The largest military-civilian medical symposium ever held in New England by the Army will be conducted at Murphy Army Hospital in Waltham, June 23 through 25. Leading Boston specialists and Army medical chiefs will discuss 23 vital topics, and about 400 physicians, surgeons, and dentists of the Northeastern States are expected to attend. Major General George E. Armstrong, Surgeon General of the Army, will deliver the opening address.

Massachusetts General Hospital is well represented on the program. Dr. Edward D. Churchill will discuss a paper on "Hyperparathyroidism" to be delivered by Major General Leonard D. Heaton, Commander of the Letterman Army Hospital in San Francisco. Also to be featured on the program are Drs. Oliver Cope, Varaztad H. Kazanjian, Donald S. King, Robert R. Linton, Laurence L. Robbins, Richard H. Sweet, Kurt H. Thoma, Arthur L. Watkins, and James C. White.

Invitations to hear the discussions may be obtained by writing to the symposium headquarters at Murphy Army Hospital. No registration fee is required.

The Board of Trustees, at their meetings on April 18 and May 2, voted:

To accept with great regret the resignation of Dr. James R. Killian, Jr. from the Scientific Advisory Committee;

To accept the resignation of Dr. Frederick C. Robbins from the position of Assistant to the Children's Medical Service, as of April 30.

To appoint:

Dr. Lawrence J. Barrows as Resident in Neuropathology, to begin July 1;

Dr. George Christman as Assistant Dental Surgeon, beginning July 1;

Dr. Thomas Frank as Assistant Resident on the Children's Medical Service from July 1, 1952 through June 30, 1953;

Dr. Thomas R. Goethals to the Board of Consultation;

Dr. Robert C. Lincoln as Intern on the Dental Service for the year beginning July 1;

Dr. William D. Nichol as Clinical Fellow in Radiology, with the duties of an Assistant Radiologist;

Dr. James P. Ryan as Intern on the Dental Service for the year beginning July 1.

At their meetings on March 28, April 18 and 25, and May 2, the General Executive Committee voted to make the following promotions on the Surgical Service, each effective as of July 1, with one exception:

Dr. Richard C. Austin from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. John F. Burke from the position of Intern to that of Third Assistant Resident;

Dr. Robert C. Coe from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. John O. Esslinger to the position of Senior Resident on the Orthopedic Service, effective as of January 1, 1953;

Dr. Frank W. Garran, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. Melvin J. Glimcher from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. Thomas H. Green, Jr. from the position of Second Assistant Resident to that of First Assistant Resident;

Dr. Walter M. Haynes, Jr. from the position of Intern to that of Third Assistant Resident;

Dr. Clement A. Hiebert from the position of Intern to that of Third Assistant Resident;

Dr. Richard N. Kleaveland from the position of Intern to that of Third Assistant Resident;

Dr. Isaac V. Manly from the position of Second Assistant Resident to that of First Assistant Resident;

Dr. D. Franklin Milam, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. Federico Mora from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. Talmage W. Nielsen from the position of Second Assistant Resident to that of First Assistant Resident;

Dr. William P. J. Peete from the position of Second Assistant Resident to that of First Assistant Resident;

Dr. George S. Richardson from the position of Second Assistant Resident to that of First Assistant Resident;

Dr. Frederick G. Shaffer from the position of Intern to that of Third Assistant Resident;

Dr. David B. Sheldon from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. Clifford J. Straehley, Jr. from the position of Second Assistant Resident to that of First Assistant Resident, assigned to Urology;

Dr. Eji Suyama from the position of Third Assistant Resident to that of Second Assistant Resident;

Dr. Jack E. Tetirick from the position of Intern to that of Third Assistant Resident.

To appoint:

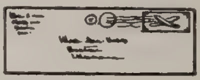
Dr. Lawrence J. Barrows as Clinical and Research Fellow in Neurology, effective July 1, this appointment to run concurrently with his appointment as Resident in Neuropathology;

Dr. Abraham Fineman as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. John B. Harris as Graduate Student Assistant in Surgery for a period of two months, beginning April 2 and ending June 2;

Dr. Theodore F. Hueter as Research Fellow in Physics, assigned to Neurosurgery, for one year, beginning January 1, 1952;

Dr. Philip M. Margolis as Clinical Fellow in Psychiatry, beginning July 1.



New addresses:—

Dr. Wallace C. Bedell (*E.S.* 1945), 168 South Cherry St., Poughkeepsie, N. Y.

Lt. William N. Christenson, MC, USNR (*M.* 1949), MSTS Atlantic, 58th St. and 1st Ave., Brooklyn 50, N. Y.

Dr. John J. Cranley, Jr. (clin. assoc. *S.*), 1180 Beacon St., Brookline, Mass.

Dr. Robert N. Ganz (*C.M.* 1925) 262 Beacon St., Boston, Mass.

Dr. Elizabeth M. Hincks (psychol. 1951), Psychology Department, St. Elizabeth's Hospital, Washington, D. C.

Dr. Dera Kinsey (a.r.p. 1939), 203 Commonwealth Ave., Boston, Mass.

Lt. John W. Littlefield, MC, USNR (*M.* 1948), U.S.S. *Repose* AH-16, c/o Fleet Post Office, San Francisco, Calif.

Dr. Earle D. Mason (*M.* 1946), 174 Denslow Ave., West Los Angeles 49, Calif.

Dr. Kenneth M. Metcalf (r.p. *C.M.* 1925), 169 East 78th St., New York, N. Y.

Dr. Laszlo Ormandy (*Or.* 1943), 1532 16th St. N. W., Washington 6, D. C.

Dr. Richard L. Pearse (*E.S.* 1934), 604 West Chapel Hill St., Durham, N. C.

Dr. Thomas Rutter (*E.S.* 1946), Jackson Clinic, 16 South Henry St., Madison, Wis.

Dr. D. Vernon Thomas (a. an. 1952), Massachusetts Memorial Hospitals, Boston, Mass.

Brief bits:—

Dr. Edward B. Benedict, Endoscopist on our Staff, discussed the various types of gastroscopes at the meeting of the American Gastroscopic Society on May 1. At the meetings of the American Gastroenterological Association, held on May 2 and 3, Dr. Benedict discussed two papers: "Endoscopic aspects of the gastric mucosa in relation to its function", by S. J. Stempien, Jacob Oritt, and Norman Karr; and "The use of anesthetic agents in gastroscopy", by John S. Atwater.

Dr. Earle M. Chapman, Associate Physician at M.G.H., will be in Chicago June 7-12 as a delegate from Massachusetts to attend the American Medical Association meetings.

Dr. Albert E. Sloane, Assistant Surgeon in Ophthalmology at the Massachusetts Eye and Ear Infirmary, delivered a lecture on "Children with visual handicaps" at the Harvard School of Public Health on April 23.

MASSACHUSETTS EYE & EAR INFIRMARY

The position of Senior Ear, Nose and Throat Resident has been renewed this year. This post, created during the wartime emergency but not continued in the past few years, provides for additional supervision of the resident group and relieves the Chief of Service of a number of administrative details. Dr. George F. Reed has been appointed to serve as the new Senior Resident.

Members of the Winthrop Foundation for the Deaf took part in a panel discussion on "The hard-of-hearing child". The discussion was held at the Massachusetts Speech Conference held in Worcester on May 3. Miss Helen Patten, Speech Therapist, acted as Chairman of the panel. Mrs. Victoria Jesseman, Speech Therapist, presented a demonstration with two of the Winthrop Foundation's young pupils. A paper, "How Social Service helps to integrate the professional services for the child with a hearing problem", was read by Miss Madelaine Shipsey, Social Case Worker.

Miss Isabel Whiting, Director of Social Service at the Infirmary, has been appointed an Associate in Medical Social Work on the faculty of Simmons College School of Social Work.

Dr. Mahmud Ali Shah, Professor of Ophthalmology at the Dow Medical College, Karachi, Pakistan, is observing the work carried on here by the Eye Service. Dr. Shah, who recently completed the postgraduate course in Ophthalmology given by Harvard Medical School, plans to spend a year in this country. He holds a fellowship granted under the United States Point IV Program.

THE NEWS appreciates very much this nice letter from Dr. Merrill Lineback (*Otolar.* 1952). From 113 Fourteenth Street, N.E., Atlanta, Georgia, Dr. Lineback writes:

> It was very pleasant being associated with all my friends on Olympus, and I shall always treasure fond memories of the M.G.H. and E. & E. Greetings from the *very* sunny south to all up there.
>
> My office is located "between the Peachtrees" on, I think, one of the old Civil War thoroughfares; and sometimes, late in the afternoon, the fading sunlight glancing off the shiny chrome of the passing stream of homeward-bound cars appears to reflect from a loose-hung sabre or a fixed bayonet. In the mist of car exhaust appears for a fitful instant a battered, diaphanous gray — or blue — uniform.
>
> Enough of this daydreaming! As you can see, I have few patients as yet.
>
> Hope to visit you-all whenever I'm up Boston way.
>
> Warmest regards.

Since the Infirmary has joined the more general trend and is using in its latest Annual Report the unhyphenated form for the word "Otolaryngology", THE NEWS has also adopted this spelling for all notices which refer to that department of the Infirmary. — *Editor*

The Women's Auxiliary to the Middlesex South District Medical Society was entertained at McLean Hospital on March 11. Mrs. James Marvin Baty presided over the meeting.

Dr. W. Franklin Wood, Director of McLean, spoke about the history of the Hospital from the time of its incorporation in 1811. He told of the many changes which have affected the Hospital through the years and of the modern treatments which are at present employed to aid in restoring the mentally ill to normal health.

Miss Margaret C. Tibbetts, Director of Nurses and Nursing Service at McLean, gave a brief history of the McLean Hospital Nurses Training School from the time of its beginning in 1882. Miss Tibbetts also spoke about the recruitment of nurses at the present time, and emphasized particularly the future for nurses in the field of psychiatry.

Mrs. W. Franklin Wood and Mrs. Paul M. Howard, whose husband is Acting Chief of Psychiatry at McLean, poured at the tea given in Higginson House.

The McLean Hospital School of Nursing held its Investiture Service in the Samuel Eliot Memorial Chapel on March 17. Mrs. Evangeline H. Morris, Director of the Simmons College School of Nursing, addressed the students who were being formally accepted into the School. Dr. Wood and Miss Tibbetts presented to the women their caps and to the men their four-in-hand ties to replace the bow-ties.

Following these presentations, a Florence Nightingale lamp was lighted and the students recited the Florence Nightingale Pledge. A picture of this very impressive part of the ceremony is on page 6. The beautiful Chapel window is shown in the background.

The Reverend Cuthbert Fowler pronounced the benediction. Dr. Homer Whitford presided at the organ.

Twelve student nurses were accepted into the School.

Forty-five long-term employees at McLean were presented with service pin awards at a buffet supper on May 2.

Dr. Wood introduced Mr. Ralph Lowell, a member of the Board of Trustees, who presented the pins as "a token of appreciation for long and faithful service". Dr. Wood then awarded a ten-year pin to Mr. Lowell.

A 50-year pin was presented to Mr. Alfred Mercer of the Hospital's upholstery shop. Mr. Mercer is the first McLean employee to receive such an award and the third employee of the Massachusetts General Hospital Corporation to be so honored. The other two were Mr. Eric Frankson, past Storekeeper, and Mr. Robert Henderson, past Dean of Orderlies, both of the General Hospital, who received their 50-year pins on Ether Day, 1945.

Mr. Salvina Britts received a 40-year pin. Six employees received 30-year pins, fifteen received 20-year pins, and twenty-two received 10-year pins.

* * *

GASTROINTESTINAL CLINIC

The Gastrointestinal Clinic continues its weekly sessions, Tuesday afternoons, with an attendance averaging 30 patients. The roster of patients grows from year to year. Most of them are handicapped by maladies characterized by recurrent symptoms, and appear to find in this Clinic a helpful continuity of care by one responsible physician or surgeon. The majority of cases come under the following diagnostic groups:

1. Chronic ulcerative colitis

    a. The ambulatory cases of relatively mild degree and limited involvement of the colon. These are more frequent than usually supposed by doctors who see only the ulcerative colitis of severe character, on the hospital wards. These people are doing a day's work as housewives, mill hands, truck drivers, and school children. Some of them do not seem inadequate at all. Some need our psychiatrist consultant's guidance; or the responsible physician in the Clinic needs the psychiatrist's help, so that he may curb his impatience and know what not to do. These patients can be kept effective; some, as the years go by, can be labeled — tentatively — "healed".

    b. The precariously balanced case, recently discharged from the hospital ward, and trying to meet obligations within all too clear limitations. It is for these patients that we ask for and get such practical aid from our Social Service workers.

    c. The ileostomy cases. Dr. Richard Warren has provided the impetus for establishing a new group, within the Clinic, for ileostomy cases that report the first Tuesday of each month. Here they settle the minutiae of detail concerning the care of ileostomy. This takes patience, and an inordinate amount of time. The reward is physical comfort for the individual ileostomy patient, and a bolstering of the *esprit de corps* of these plucky people.

2. Cirrhosis of the liver

    It is encouraging to follow some of the recently "decompensated" livers, in the months after hospital discharge. These patients rally well; they need a clinic that can give them the long view. There have been instances here where physician and social worker, with psychiatrist's assistance, have been able to do constructive preventive medicine for the as yet salvageable cirrhotic patient.

The Clinic serves as a follow-up for some of the cirrhotics who have had spleno-renal or posto-caval shunts. Other cases can be prepared for such surgery.

3. Peptic ulcer

It is with these cases that the Clinic's opportunity for teamwork of surgeon and physician is particularly helpful. The pros and cons of surgical measures for relief of intractable pain can be threshed out by doctors who have followed the progress of symptoms over months or years, and know the patient well.

It is to the Gastrointestinal Clinic that come the poor results of subtotal gastrectomy, as well as the far more frequently comfortable patients who return periodically to report that they are symptom-free following this operation. The patients with the "Dumping syndrome" have been encouraged to return to us, particularly to Dr. Culver, who has done much to alleviate their lot and to study the genesis of their symptoms.

4. Among other diagnostic groups, there has been particular interest in the benign esophageal strictures who receive bouginage therapy in the Clinic; the convalescents from infectious hepatitis; the diaphragmatic hernias that may or may not cause appropriate symptoms; and the ileitis group.

The personnel of the Clinic remains much as it was at the last report, four years ago. Dr. Richard Warren has joined the surgical side of the team. The members of Dr. Jones's group of research fellows have contributed a great deal — Drs. Mora, Dalrymple, Benson, and Ebeling. Dr. Arthur French, prior to his departure to join the University of Utah Medical School faculty, was a highly valued member of the Clinic. Dr. Warren Point continues the active work begun as a research fellow. Dr. Eugene Smith has served as consultant psychiatrist, and most helpfully.

Miss Dorothy Kellogg is the member of the Clinic with the most years of experience. She is, in her capacity as Social Service worker, a wise counselor, gracious hostess, and indispensable smoother of ruffled feathers. Mrs. Foley, who has presided over the Reception Desk for several years, makes the Clinic a place to which our patients like to come.

Myles P. Baker, M.D.,
Head of Gastrointestinal Clinic

* * *

National Hospital Day was observed at M.G.H. with a very interesting tableau, given in the Moseley Rotunda on the afternoon of May 12. An audience of invited guests, many of whom were those who have served as volunteers here at the Hospital, was greeted by Dr. Clark, who outlined the over-all picture of patient care and stressed particularly the role of the volunteer as an indispensable segment of the Hospital activities. Dr. Clark then introduced Dr. Berg, who can out-MC any other MC to be found anywhere – professional or otherwise. With Dr. Berg in the speaking role and Dr. Leonard Laster, an Assistant Resident in Medicine, enacting most realistically and often convulsingly the pantomimic part of a bedridden patient, the audience was taken through each step in a patient's experience from the time he enters the Admitting Office or the Emergency Ward until he is discharged from the Hospital.

1. The patient was met in E.W. by two volunteers, who wheeled him in his bed to his imaginary room on the Medical Service. Dr. Berg brought out the fact that nearly 48,000 hours were contributed by our volunteers during 1951.

2. The functions of the two nurses who then appeared at the patient's bedside were explained by Miss Sleeper.

3. A member of the House Staff, represented by Dr. Kurt J. Isselbacher, Assistant Resident in Medicine, visited the patient while Dr. Berg explained his various duties.

4. Mealtime having been reached, Miss Hatch gave a résumé of the activities of her department. She informed us that, on an average, 5,000 meals a day are served at M.G.H. each year, with food bills amounting to $555,000 per year. The many special diets were mentioned.

5. The visit of the student doctor who appeared next at the patient's bedside was described by Dr. Berg. He said that in some instances the eager interest displayed by the student has inspired the patient with such confidence in him that the student is the doctor the patient prefers above those with greater experience.

6. Next to appear beside the patient was a member of the Research Staff. Dr. Berg enumerated the several subdivisions of this Service, and told us that a budget of $2,000,000 a year for research is made possible through the many grants from contributing organizations and others. It should be remembered that all expenditures for research are scrupulously segregated from other expenses and do not in any way increase the cost of hospitalization of patients.

7. A member of one of our laboratories then made an appearance, while we were again instructed in what was going on.

8. A technician with a portable X-ray machine appeared next, and while Dr. Berg was explaining that this type of machine is less satisfactory than the stationary ones and is used only when it is inadvisable to move the patient to the X-ray Room, the technician was taking a picture of the patient's arm.

9. After all this, the patient was now ready for the "Visit" – the member of the Visiting Staff who was scheduled for hospital service at this particular time. Dr. Bland played the role. On the basis of his own and the preceding examinations of the patient, Dr. Bland believed that surgery was indicated and requested a consultation.

10. Dr. Churchill appeared as the Consulting Surgeon, made his own examination, and offered his advice to the Visit. Dr. Churchill pointed out that the Visit is *the doctor* in each case and that the Visit may or may not accept the advice of the Consultant. It was also brought out that doctors representing four degrees of training are called upon for each person who enters the Hospital as a bed patient – a medical student, an intern, a resident, and one member or more of the visiting staff.

11. At this point a physical therapist made her appearance, with equipment for the patient to use in order to expedite his recovery, and an occupational therapist, bringing a small loom, provided the patient with a project which would tend to draw his mind away from his woes.

12. When the patient was ready to leave the Hospital the Social Service Department took over. Miss Barbour outlined briefly the many ways in which Social Service is essential during the period up to complete recovery and adjustment to home and other conditions outside the Hospital.

In summing up, Dr. Berg brought out the fact that patient care now costs the Hospital almost $8,000,000 a year. High prices for medicines and equipment, and other factors which intensified the situation, resulted in a deficit of $172,000 at M.G.H. for 1951.

On a blackboard at the right of the stage was a list of Hospital departments, and as the talks went on Mrs. Courtney recorded the number of persons included in each group. The tabulation showed:

170	Administration
550	Volunteers
1100	Nursing Department
117	House Staff
	25 First Year
	67 Second Year
	14 Third Year
	11 Fourth and Fifth Years
335	Dietary Department
130	Students
206	Research Staff
149	Laboratory Staff
75	X-ray Department
	15 M.D.'s
	60 Lay Personnel
320	Visiting Staff
45	Social Service Department
8	Physical Therapy Department
5	Occupational Therapy Department
1046	Others
68	Accounting Department
4324	

This breakdown in figures is not only interesting in itself, but is most impressive when one realizes that in some way, to a greater or lesser degree, each one of the 4324 individuals in the Hospital family contributes to the care of every patient admitted here, either currently or in the future.

Tea was served in the East Cafeteria after the tableau.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration – an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to The News.

The following new titles have been received:

Endocrinology

Gottschalk, C. W., and Riggs, D. S.
Protein-bound iodine in the serum of soldiers and of Eskimos in the Arctic.
J. Clin. Endocrinol. & Metab. 12:235-243.

General Medicine

Jacobson, B. M., and Sohier, W. D.
The effects of ACTH and of cortisone on the platelets in idiopathic thrombopenic purpura.
New England J. Med. 246:247-249.

Neurology, Neurosurgery, and Psychiatry

Benda, C. E.
What is Mongolism? (Congenital acromicria): Pathogenesis and experimental treatment.
Internat. Record Med. 165:75-91.

Brazier, M. A. B.
Expanding concepts in Neurophysiology.
A.M.A. Arch. Neurol. & Psychiat. 67:545-549.

Durling, D., and Benda, C. E.
Mental growth curves in untreated institutionalized Mongoloid patients.
Am. J. Ment. Deficiency 56:578-588.

Orthopedic Surgery

Barr, J. S.
The surgical experiment.
J. Bone & Joint Surg. 34-A, No. 2:249-253.

Cave, E. F.
Femoral-shaft fractures treated by medullary nailing.
New England J. Med. 246:284-288.

Otolaryngology

Goodale, R. L., and Mangiaracine, A. B.
Clinical observations on the use of autogenous vaccine made from cultures of coagulase positive hemolytic staphylococcus aureus.
Laryngoscope 62:299-310.

Holmes, E. M., Sweet, W. H., and Kelemen, G.
Hemangiomas of the frontal bone.
Ann. Otol., Rhin. & Laryng. 61:45-61.

Books

Benda, C. E. (Editor)
The clinically important reflexes, F. W. Bronisch.
New York, Grune & Stratton.

L'ENVOI

In surg'ry I rise at dawn,
And work the day with hours long.
E.W. is quite perverse,
My sleeping hours are in reverse.

I must retire while surgeons slit
The case I did with care admit,
And miss each week my service rounds
Where chief and student each confounds.

And does it not seem hard to you
When ops are set that I could do
And I should like so much to cut,
And have to go and rest my nut?

With this effort at classic iambic meter completed, the embryo surgeon, late of the resident staff, pondered whether or not he would add it to his collection of verse entitled "An interne's hospital book of verse". It probably was more than chance that had resulted in his unconsciously selecting Stevenson's children's poems to parody, as, after all, hospital training is a second childhood with a professional infancy.

In reviewing the period of hospital training extending over seven and a half years, there had been a break of three years which he had divided between Japan, as a member of the Army of Occupation, and investigative work at M.I.T. These years had seemed like a vacation in comparison with the intense hospital work. With his training completed and a comfortable post assured at a Concord hospital, where he could achieve almost complete fulfillment of the possibilities of his training, he counted himself as one of the lucky few. The blandishments of some of the senior surgeons with their astonishing remuneration might have convinced some that his plan to retire to an outside hospital in the Altogether Uninhabitable Interior was a poor choice. He had made the decision firmly and looked forward to the practice of general surgery.

No one could deny that his training had been of the best, and a rugged tradition of accepting almost all surgical therapy from the chin down and from the spinal column anteriorly had been implanted in his soul. What greater goal hath any man! A bit wistfully he recalled he had just missed the experience of conducting a major thoracic operation. This made no difference, perhaps, in the long run; yet what patient, in his right mind, would regard him as a gifted thoracic surgeon? These thoughts were possibly the expression of an occasional twinge of malnourished confidence, or could they be a rational recognition of a deficiency? Obviously, the doing of an operation was a small part of the training, or so he had been encouraged to believe; and, in any event, rumor had it that an operative repertoire was of less importance than longevity in establishing a private practice in the Altogether Uninhabitable Interior. On looking back over the years, how much pleasure remained in the memories of his training!

The professional infancy of the internship with training again directed to the proper management of excreta. . . . the first day of rounds with surveillance by the beady, ferreting glance of his resident. . . . the elegant and Oh-so-mortifying disdain the head nurse imparted in correcting his dosage of a drug. . . . the staccato bark of the page braying his name and initials. . . . the rapture at developing norms in blood bank physical examinations in the basement of Moseley. . . . the pungent odor of vitamin B ampules in preparing IV's. . . . fulminating, acute, irreversible exasperation with elevators. . . . the sincerity expressed by the old Italian's son and his gift of Chianti. . . . a 3 A.M. burn case hematocrit. . . . a first appendectomy. . . . candor and responsibility at service meetings. . . . the crushing weight of precedence. . . . and then a change party, refreshing all participants, giving each tie a new look, and joining visit and intern alike in the pursuit of happiness in the hospital neighborhood.

These and other thoughts, sprinkled with easy and hard clinical decisions, highlighted by smooth and challenging operations, blended into a miniature whirlwind of vivid details that spun rapidly through the young surgeon's mind, and in the mounting column of clinical impressions there emerged the physical form of the Phillips House and the Baker Memorial. Each floor had made its mark, and from the arena of surgical sleight of hand and finesse atop the Phillips House to the linen room stronghold in the basement of the Baker Memorial, every corner, every polished passageway, and every personality brought forth a companion experience for each hour of the day and the night. Would his time ever be so fully utilized again? He clearly would never learn as much so rapidly in the future, but at least time for reflection might permit him to digest and assimilate the gargantuan clinical repast and let him decide which course he really liked best and how he might flavor it another time.

Had he devoted more time to his training than necessary to gain his present understanding of clinical surgery? If he didn't seriously question himself on this score, his friends had done so with something less than perfect understanding. Those who had answered other professional callings were at times astonished at what they recognized as non-professional work amongst his duties. Of course they were misinformed, and if you couldn't convince a bright, young lawyer about the professional aspects of errands to the blood bank, laboratory work, and wheeling beds, this clearly represented a deficiency of the legal mind. One of his

Investiture Service in the Samuel Eliot Memorial Chapel at McLean Hospital

friends, with the doubtful qualification of being a junior member of Philip Murray's staff, had muttered something about present-day lengthy methods of medical training favoring the financially independent and erecting an undemocratic barrier to be scaled by the less fortunate doctors with families. On recalling this intolerant statement the young surgeon warily shook his head, sensing an argument which, if not suppressed, might lead to theories subverting the order of established medical practice. Some social and economic arguments seemed to have implications concerning the progressive position to be assumed by medicine today, and yet he had done nothing, or next to it, to develop his concepts in this political sphere. At thirty-five years of age was he only twenty in a political and civic sense? Probably not, since most of his surgical contemporaries felt at home in these matters.

It *had* been a *wonderful* training, comparable only to a few of the great experiences obtainable today in a world dedicated to television, propaganda, and nuclear fission. Surgical training is a microcosm and partakes of all that is great and petty in life, and by its compressed intensity and demands and by the high quality of its leadership it stands unique as a humanitarian and educational venture. So thought the young surgeon, packing his toilet articles off the dusty top of his Moseley bureau.

He returned his key to Dr. Clay, accepted his fifty cent deposit, and departed for Concord.

B. A. B.

The House Staff Penthouse on the 14th floor of the White Building has been beautifully decorated by members of the Staff Wives Club, the Ladies' Visiting Committee, and other friends of the Hospital.

We should be happy to have the members of the Visiting Staff come up any time to see the apartment.

House Staff Committee

On Thursday evening, May 8, Dr. Madan M. Singh, Intern in Medicine, gave an informal talk on India for the Distaff Club and members of the House Staff. The meeting was held in the Penthouse at 8 o'clock. Mrs. Byrl J. Kennedy acted as hostess and was in charge of refreshments. Mrs. Amasa B. Ford introduced Dr. Singh, who spoke of some of the interesting social and religious customs of India. Questions and a general discussion followed Dr. Singh's talk.

The many friends of Lt. Sigurd B. Gundersen, Jr., MC, USNR (*S.* 1949) will be glad to receive this word from him.

> I have appreciated very much receiving The News since I have been in the Navy.
>
> At the present time I am stationed at the Great Lakes Naval Hospital and am living with my family in Waukegan, Illinois. If things remain the same, I should be out of the Service in November, and I hope to get back to residency training again.

A note – all about MGH-ers – has come from Dr. Charles H. Burnett (c.r.p. 1946). From the University of North Carolina, Chapel Hill, he writes:

> As of July 1st, we will have quite a contingent of General men here in the Department of Medicine of the University of North Carolina, which is currently expanding from a two- to a four-year school. In addition to me, there will be Dr. Isaac M. Taylor (*M.* 1946) and Dr. Ernest Craige (*M.* 1943) as Assistant Professors of Medicine; Dr. Thomas B. Barnett (*M.* 1950), Instructor in Medicine; and Dr. Carl W. Gottschalk (*M.* 1946), who will have a traineeship here from the National Institute of Health and will be working with Dr. Craige.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 114 Boston, Mass. July and August 1952

THE HOUSE STAFF CLUB ROOMS

The Penthouse on the top floor of the White Building has been turned over to the House Staff for use as club rooms, and an Open House was held there Wednesday, May 28, attended by about 300 guests.

This project was undertaken several months ago by the Staff Wives group. The House Staff sent out letters to people interested in the Hospital and received a very enthusiastic response—163 people, from 29 States, replied with contributions amounting to approximately $2,900.

There was widespread local interest, as well. Coffee parties were given in five different communities to collect phonograph records and books. Hostesses in their respective communities were Mrs. Joseph C. Aub, Mrs. Walter Bauer, Mrs. Earle M. Chapman, Mrs. Daniel S. Ellis, and Mrs. James C. White. Mrs. Raymond D. Adams, Mrs. Marshall K. Bartlett, and Mrs. Howard Ulfelder made collections in their own neighborhoods. In response to these combined efforts, about 500 books and 200 records were collected.

The Boston Museum of Fine Arts has loaned pictures for the rooms, among them two Rosenbergs; and both Dr. J. Howard Means and Dr. Fritz B. Talbot have given original paintings. The Vose Galleries have loaned a handsome carved head, done in wood by the sculptor Charles Cutter. Dr. Lamar Soutter gave a Capehart Victrola. Among the other gifts received were a piano, a percolator, china, and incidental accessories.

The decorating committee, consisting of Mrs. Walter S. Burrage, Mrs. Henry H. Faxon, and Mrs. Howard B. Sprague, has done an outstanding job. The modern decorative formula combining refreshing colors, function, practicability, and comfort is executed to perfection throughout the apartment. Each room has a distinctive decor expressed in comfortable lounges, chairs, occasional tables, etc., and each has been planned for a separate activity. The piano, television set, and record player are placed in separate rooms, so that each may be enjoyed without conflict with another. The colors and arrangements in the entire apartment are most original, and it would be difficult to single out any one room for specific comment. The living room is gracious and comfortable, ideal for entertaining or for individual relaxation. French doors open out to a terrace which affords an excellent view of the Charles River and environs. Another room to excite considerable interest and comment is the "Bird-Cage Room", which derives its name from the paper on one wall—a whimsical motif of white and yellow bird-cages on a gray background.

For the opening Mrs. William H. Sweet contributed some delightful flower arrangements designed to complement the color schemes in the various rooms. Miss Louise Hatch, Director of the Dietary Department, provided the refreshments.

Particular thanks are due the carpenters and painters of the Hospital for their interest and assistance.

Every one of us on the House Staff wishes to thank all those who helped make our new Club rooms possible – those who were instrumental in securing the apartment; all those who helped raise the money, decorate the rooms and furnish them; and all who contributed money, books, phonograph records, and pictures.

If we have failed to mention anything or anyone, please forgive us. It's because there has been so much done we can't yet take it all in.

* * *

Dr. Fritz Lipmann, Research Chemist on our Staff, is one of 19 biochemists in his country chosen to receive scholarships from the National Science Foundation, to attend the Second International Congress of Biochemistry in Paris, July 21-27. The choices were made on the basis of contributions to research in biochemistry, as recommended to the Foundation by a committee appointed by the American Society of Biological Chemists and endorsed by the Biological Chemistry Division of the American Chemical Society.

Dr. J. H. Means, recently Chief of our Medical Services and now a member of our Board of Consultation, was the recipient of the Squibb Award for 1952 at the Annual Meeting of the Endocrine Society, held in Chicago on June 6. The Award was made "for meritorious work in the field of Endocrinology". This is the twelfth time the Award has been granted. One other MGH man has received it – Dr. Fuller Albright, in 1948.

Dr. Paul D. White, a member of our Board of Consultation and Executive Director of the National Advisory Heart Council, was voted the winner of the Distinguished Service Award of the American Medical Association for 1952. The award consists of a gold medal and a citation "for outstanding service in the science of Medicine", and was conferred upon Dr. White at the 101st Annual Convention of the A.M.A., held in Chicago in June.

OFFICIAL NOTICE

In order to clarify and strengthen the administrative organization of the Hospital and to give recognition to outstanding administrative accomplishments, the Trustees have taken the following actions, effective as of May 6, 1952:

1. Dr. Charles L. Clay has been appointed Assistant Director with tenure until the usual retiring age for full-time staff.
2. Dr. Ellsworth T. Neumann has been promoted from Assistant Director to Executive Officer for the entire Hospital.
3. Mr. Henry J. Murphy has been promoted from Administrative Assistant in charge of Housekeeping and Laundry to Assistant Director for the entire Hospital.
4. Dr. Leon R. Lezer continues as Assistant Director, but his duties have been broadened to include the entire Hospital.

Dr. Clay will continue to act as my deputy for matters of general policy.

Dr. Neumann will direct the day-to-day execution of the administrative functions of the entire Hospital, based on the general policies established by the Trustees and the General Director.

Mr. Murphy will give technical administrative assistance to all units of the Hospital and will serve on the Budget Committee.

Mr. Arthur C. Rood has been appointed Head of Laundry and will attend Tuesday morning administrative conferences.

Mr. William McNair has been appointed Head of Housekeeping and will attend Tuesday morning administrative conferences.

It is to be clearly understood that this new administrative organization is intended to simplify and make more efficient the day-to-day operation of the Hospital, and that it does not limit in any way the right of all Chiefs of Service and all Department Heads to have direct access to the General Director. . . .

Dean A. Clark, M. D.,
General Director

The Board of Trustees, at their meetings on May 16 and 29, voted to appoint:

Mary A. B. Brazier, Ph.D. as Neurophysiologist on the Neurological Service, in addition to her appointments in Anesthesia and in Psychiatry;

Dr. Ernest S. Crawford as Resident in Surgery for one year, beginning January 1, 1953;

Dr. Harold E. Dysart as Assistant Resident in Anesthesia, beginning January 1, 1953;

Dr. Alex F. Müller as Assistant Resident in Medicine, beginning January 1, 1953;

Richard H. York, Ph.D. as Assistant Psychologist, beginning May 5.

At their meetings on May 9, 16 and 23, and June 6, the General Executive Committee voted:

To continue the appointment of Dr. James P. Hepburn as Assistant Resident in Anesthesia, to begin September 1.

To promote:

Dr. Leonard W. Cronkhite, Jr. from the position of Assistant Resident to that of Resident in Medicine, effective January 1, 1953;

Dr. James B. Field from the position of Intern to that of Assistant Resident in Medicine, effective October 1;

Dr. Richard A. Field from the position of Assistant Resident to that of Resident in Medicine, effective October 1;

Dr. Gerald S. Foster from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Arthur Haut from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. Kurt J. Isselbacher from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. John H. Knowles from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Stephen M. Krane from the position of Intern to that of Assistant Resident in Medicine, effective October 1;

Dr. Leonard Laster from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. Martin B. Levene from the position of Second Assistant Resident to that of First Assistant Resident in Radiology, beginning July 1;

Dr. Alexander S. Macmillan, Jr. from the position of First Assistant Resident to that of Resident in Radiology, beginning July 1;

Dr. George B. Murphy, Jr. from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. Avrum B. Organick from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. John C. Rowe from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Madan M. Singh from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. William A. Tisdale from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Giles D. Toll from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1;

Dr. Elbert P. Tuttle from the position of Intern to that of Assistant Resident in Medicine, effective October 1.

To appoint:

Dr. Bernard J. Doyle as Clinical Fellow in Physical Medicine for one year, beginning July 1;

Dr. William C. Ebeling as Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, for the period June 2 through July 31 and the additional period September 2 through September 30;

Dr. Freddy H. Frankel as Clinical Fellow in Psychiatry, to begin September 15;

Dr. Shepard C. Ginandes as Clinical and Research Fellow in the Children's Medical Service, assigned to the Children's Psychiatric Group, for one year, beginning July 1, 1953;

Dr. Salomao Kelner as Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, for the period May 1 through July 31;

Dr. Abdul R. A. Kerim as Clinical Fellow in Medicine, beginning July 1;

Dr. Louis C. Lasagna as Clinical and Research Fellow in Anesthesia, effective as of May 23;

Dr. Donald M. Mitchell as Clinical Fellow in Medicine, assigned to the Rheumatic Diseases Study Group, for one year, beginning July 1;

Dr. Savitri Ramcharan as Clinical Fellow in Medicine, assigned to the Rheumatic Diseases Study Group, for one year, beginning July 1;

Dr. Hyung J. Roh as Graduate Student Assistant in Surgery, for the term May 6 through November 6;

Dr. Remedios K. Rosales as Clinical Fellow in Neurology for one year, beginning July 1;

Pierre J. Stoffyn, Ph.D. as Research Fellow in Biochemistry, assigned to Medicine, for one year, effective September 1;

Dr. Edward F. J. von Hueber as Clinical Fellow in Medicine, assigned to Cardiology, effective as of April 8.

⁂

STAFF WIVES

While some members of the Staff Wives group have contributed time and interest to the highly successful project of the House Staff Club rooms, other activities have been inaugurated, as well – in particular, plans for extending hospitality to visiting doctors from abroad and incoming members of the House Staff.

On May 24 a picnic was held by Dr. and Mrs. Bradford Cannon on the grounds of their lovely country place in Lincoln. The weather was ideal, and several hundred people, a number which includes many children, had a perfectly wonderful time.

On July 12, under the auspices of Mr. David Crockett, Associate Director of Resources and Development, an outing is being planned to be held in Ipswich. Guests are privileged to choose between a picnic and swim at nearby Crane's Beach, or a lobster dinner and concert on the estate. Members of the Hospital Staff interested in attending the latter are urged to apply for their tickets early; visiting doctors and their families from other countries will be guests of the organization.

About the middle of July the incoming House Staff will be honored by a party. Dr. and Mrs. Edward Churchill will entertain for the surgical group, and Dr. and Mrs. Walter Bauer, together with Dr. and Mrs. Joseph Aub, will entertain for the medical people. The parties will be given simultaneously on the adjoining properties of the Churchills and the Aubs in Belmont. Highlight of the occasion will be a baseball game – Medical vs. Surgical Services – on the diamond of the nearby Belmont Hill School.

Mrs. Henry K. Beecher and Mrs. Raymond D. Adams have plans for entertaining periodically during the summer at their homes, inviting doctors' families now here from abroad, particularly those with small children, to "come out for the day". They would like to hear from other Staff Wives who have expressed themselves as willing to entertain in this way, as they have available an up-to-date list of visitors who would most certainly enjoy an opportunity to spend a few hours or a day in the country.

With the summer plans now under way and under consideration, it looks as if the season will be a busy one for all of our group.

MASSACHUSETTS EYE & EAR INFIRMARY

At the American Medical Association meetings held in Chicago, Dr. Edwin B. Dunphy, Chief of our Eye Service, served as Chairman of the Section on Ophthalmology. Dr. Dunphy's address as Chairman was given on June 10. Dr. Trygve Gundersen is Secretary for the Ophthalmological Section.

Dr. David ~~C.~~ G. Cogan, Director of our Howe Laboratory, was Chairman of the Association for Research in Ophthalmology, which met in combined sessions with the Section on Ophthalmology.

Dr. Wiliam Stone, Jr. read two papers – one, a discussion of "Experimental study of plastic material as a substitute for opaque corneas", and the second on "The use of lid sutures in cataract surgery, and presentation of a new technique".

A paper on "Analysis of results of idiopathic retinal detachments" was presented by Dr. Taylor R. Smith.

Infirmary doctors attended the series of otolaryngological meetings held in Toronto, Canada, in late May and early June. Dr. LeRoy A. Schall, Chief of our Ear, Nose and Throat Service, Dr. Harris P. Mosher, Dr. Philip E. Meltzer, and Dr. Werner Mueller serve on the examining board of the American Board of Otolaryngology. Dr. Schall, President of the Board for 1951-52, was re-elected President for the coming year. Dr. Schall was also chosen as President-elect of the American Laryngological, Rhinological and Otological Society.

Dr. Moses H. Lurie presented a paper on "Ototoxic action of streptomycin, dihydrostreptomycin, and neomycin" before the American Otological Society.

Dr. Varaztad H. Kazanjian, Consulting Surgeon in Plastic Surgery at the Infirmary and Professor *Emeritus* of Plastic Surgery of Harvard Medical School, again received recognition for his distinguished career when he was presented the honorary degree of Doctor of Science by Bowdoin College at the June 7 commencement exercises.

Dr. Philip E. Meltzer, Surgeon-in-Chief of the Winthrop Foundation, discussed "Causes and treatment of deafness" recently on N.B.C.'s television series "Here's to your health". The half-hour program was presented under the auspices of the American Hearing Society, the Lexington School for the Deaf, and the New York Academy of Physicians and Surgeons.

The Winthrop Foundation and Clinic for the Deaf held open house on June 20 for members of the Volta Speech Association. Staff members of the Winthrop Foundation acted as hosts and were on hand to answer inquiries and to explain the Foundation's program. The visitors observed speech therapy classes taught by Miss Helen Patten and Mrs. Victoria Jessemen. The three-fold rehabilitation work carried on by the Winthrop Foundation – in medical treatment, speech therapy, and community education – was summarized on a large chart which illustrated the activities of the doctors, audiologists, speech teachers, and social workers.

AMPUTATION CLINIC

It has long been recognized that the amputee presents a special problem in rehabilitation which demands the coordinated activities of the surgeon, orthopedist, physiatrist, social service worker, and the limb fitter. The problems of the amputee loom formidably after surgery has been performed and are always present for those patients with congenital amputations who must receive guidance in order to take their place in society as active, happy, productive, and independent individuals.

The Amputation Clinic was established in 1948 by Dr. Joseph S. Barr and Dr. Edward D. Churchill, to provide the special services required by the amputee. The aims of the Clinic are to rehabilitate the amputee mentally and physically as rapidly as possible. To meet these objectives the amputee is examined by a physician member of the Clinic within the first week following surgery. In those instances in which it will be possible to wear an artificial limb, the proper prosthesis is prescribed. The patient is interviewed by a social service worker, who performs invaluable service in helping to prepare the amputee for the adjustment to a new life, to build up and maintain patient morale, and to help him to look forward to his future with confidence in attaining his hopes of achievement. There are, inevitably, material considerations, and the social worker must develop those resources inherent in the family and those available in the community to meet the necessary expense of the prosthesis, rehabilitation, and the temporary dependency of the patient.

Immediately after the limb is prescribed by the physician a representative of one of the limb fitting houses in Boston is called in by Social Service and measurements are taken. These steps ensure prompt delivery of the prosthesis, often before the patient is discharged from the Hospital.

As soon as possible after surgery the Physiotherapy Department institutes an active exercise program to prevent flexion contracture and to develop the musculature necessary to manipulate the new "limb" and to establish the necessary, new balance. When the patient is ready to wear the prosthesis instruction in the proper use of the limb is continued until maximum efficiency of function is attained.

The Clinic meets on the last Friday of each month in the Bigelow Amphitheatre on White 3A at 10 o'clock, and renders its services through the Admitting Office of the Out-Patient Department to ward and private patients. Amputation problems are referred to the Clinic by MGH staff members, the ward services, the Massachusetts State Division of Rehabilitation, and by physicians throughout New England. The awakened interest in these problems is manifested by the large number of welcome visitors who attend each Clinic meeting. Between the Clinic sessions, amputees are seen every Friday morning in the Orthopedic Out-Patient Department. The Amputation Clinic itself saw 41 patients in 1948, its first year, and 107 patients were examined in 1951.

The Amputation Clinic is currently under the joint direction of Dr. Arthur L. Watkins, Chief of the Physical Medicine Department; Dr. Richard Warren of the Surgical Service; and Dr. Eugene E. Record of the Orthopedic Service. Our indispensable social service workers in regular attendance at Clinic sessions are Mrs. Hazel Fritz, Miss Catherine McHugh, and Miss Ida Salzman. The success of the Clinic is dependent to a large extent on the faithful attendance of representatives of six of the best limb manufacturing houses in Boston, who furnish and service most of the prosthetic devices for our patients. These men give generously of their time and trained advice to help resolve each individual problem.

The Clinic aspires to carry on with the wise, skillful, and kind attentions rendered in the past to amputees at the Massachusetts General Hospital by Dr. Philip D. Wilson, Dr. George W. Van Gorder, and Dr. Fiorindo A. Simeone.

Eugene E. Record, M.D.,
Assistant Orthopedic Surgeon

SURGICAL VISIT TO THE FAR EAST

"There is no truce with Adam-zad the Bear that looks like a man." Kipling's words seem particularly appropriate to recall today, at the time of our ineffectual negotiations in Korea with two satellites of the Russian Bear who, for all his deceitful hammer and sickle, is the same animal of the international jungle in the 20th century that he was in the 19th.

Would that my trip to Japan and Korea in April had given me opportunity to observe the diplomatic aspects of our efforts in the Far East; but, like other Consultants to the Surgeon General of the Army, I had my nose to the professional grindstone. I visited sixteen of our thirty Army Hospitals, plus sundry Air Force and Naval medical installations, met hundreds of doctors in uniform, gave twenty-one lectures in thirty days, and learned a lot about the excellent manner in which we are handling our military medical problems abroad. I ran into multitudes of Harvard Medical School graduates and several MGH-ers, among whom were Holly Smith (*M.* 1949), Jim Shannon (*S.* 1948), and Roger Wilcox (*S.* 1949). All these three are in Korea working on the casualties in the forward areas. Holly Smith is the member of the Army Research Team at Wonju who is directly in charge of the artificial kidney now being used for the first time in history on battle casualties.

As is usual in an overseas theatre, the Army is conducting in Japan and Korea several types of surgical practice. First, is the ubiquitous garrison practice which follows the Army wherever it goes and consists of the traumatic results of vehicle wrecks, pilonidal sinuses, hemorrhoids, and, for local color in Japan, bed warmer burns and skiing injuries. There is also in existence a large dispensary practice on U. S. dependents, including a considerable amount of obstetrics and pediatrics. In fact, the American medical profession seems to be so well settled in at some of the larger Japanese hospitals that they look very much like metastasized M.G.H.'s, complete with gray ladies and ladies' visiting committees!

A second kind of practice is the "civilian" type, which involves elective surgery of all sorts. This includes those individuals to whom the 120-day evacuation policy does not apply, namely, the occasional U.N. soldier from continental Europe for whom evacuation home is not rapid, and the multitude of Korean civilians who are now being cared for in our Army installations. Under this category esophageal, pulmonary, and gastric resections, ligations of patent ductuses, and many other things of that ilk are cropping up in American hospital beds in Korea. The local civilian medical facilities are not up to caring for all problems, and some of our hospitals are allowed to accept such patients up to one-third of their capacity. Our doctors go to local Korean dispensaries, give lectures, and discuss cases. Problem cases are there brought in for their selection. Space does not permit me to list the numbers of unusual diseases that are seen. Leprosy is common. Tuberculosis and parasitic infestation are almost a normal state. The prevalence of Ascaris infestation in gastrointestinal disease, it was pointed out to me, is a mixed blessing. In a case, say, of perforated ulcer, the Ascaris, who is detrimental to gastric tube suction because he blocks its lumen, is, on the other hand, helpful in that he sticks his head out of the perforation at the time of laparotomy and shows the surgeon where the perforation is. Ulcer cases, incidentally, because of the spicy diet, do even worse on medical treatment in Korea than in Boston (Dr. Culver please note!).

The third category of practice, namely, war surgery, is now going on under what must be nearly ideal conditions. The initial surgery is done in the Mobile hospitals, the reparative surgery in Japan. The limited, though steady, fighting, without alteration of the position of the front lines, has served to keep the Mobile hospitals active but *immobile.* Patients get from the front to the operating table by helicopter, often in under two hours. For this scale of activity there is plenty of blood available, some of which is now given in the battalion aid station within a few minutes after wounding. I saw several cases of wounds of the major intra-abdominal vessels saved as a result of this efficient set-up. The controlled circumstances under which the casualties are treated also provide an ideal arrangement for study of the many important problems in military surgery still remaining. Lower nephron nephrosis is the major cause of death in the severely wounded man who dies after getting back to the Mobile hospital. Primary restoration of continuity of arterial wounds under war conditions has improved slightly since World War II, but further progress needs to be made now that favorable conditions present themselves. Both of these problems are now receiving extensive study by the group from the Army Research Center at Walter Reed Hospital, whose representatives are with the Mobile hospital.

The Korean people represent such a different civilization from ours that it was for me, who had never traveled in Asia before, a great experience to come in contact with them. They are a rugged and sober, perhaps slightly surly, people who have never had an opportunity to govern themselves. So reft by wars have they been, and so impoverished, that our standards of property mean little to them. The Korean engineer of our U. S. hospital train, for example, has finally been prevented, after a year or so, from delivering coal from the train's bunker to his friends and relations at the whistle stops along his route down the peninsula. Physically unimpressive, they are possessed of a sturdiness and stamina which is fantastic. They carry everywhere great weights on their backs on wooden human pack-saddles called "A frames". On these they bring supplies up to our men in the foxholes on the ridges, up 45° slopes without stopping even to pant. A large colored sergeant, after thoughtfully observing such a performance, once turned to Colonel Matuska, the present Surgical Consultant to the Far East Command, and said, "Colonel, dat ain't no work for modern man!"

In Japan all is politeness and cooperation. Sincerity? That's the $64 question. All who know the Japanese seem to feel that they inevitably must trade with China. Many are pessimistic, due to the centuries-old respect of the Japanese for authority and "face", about their ability to form a true people's democracy. Most agree, however, that the Japanese will always be grateful to us for our clemency and voluntary restoration of their independence. Who knows?

My impression of the morale of our medical forces was that it is good. The point system of rotation home gives every individual a date in the future to live for. A GI humorist, who must have been in the MP's, erected at a particularly dangerous turn of the road near the front line in Korea a large sign which said "Drive carefully. You may kill your replacement!" Because of this he seems, perhaps, to be less aware of the frustrations of the global international situation than we are at home. The only date *we* have to look forward to is that indefinite but awesome one when we might have to go over there.

Richard Warren, M.D.,
Associate Visiting Surgeon

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration – an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to The News.

The following new titles have been received:

Dermatology

Ferguson, B. C., Rosenbaum, J. D., and Tolman, M. M.
Cortisone and corticotropin in treatment of diseases of the skin.
A.M.A. Arch. Dermat. & Syph. 65:535-542.

General Surgery

Cope, O.
Medical progress: Diseases of the thyroid gland.
New England J. Med. 246:368-373; 408-417; 451-457.
Dwight, R. W.
Pilonidal sinus: An evaluation of plastic closure using flaps of gluteal muscle.
A.M.A. Arch. Surg. 64:438-442.

Laboratory Science

Gottschalk, C. W.
A comparative study of renal interstitial pressure.
Am. J. Physiol. 169:180-187.

Neurology, Neurosurgery, and Psychiatry

Brown, M. R.
The mechanism involved in polyneuritis as exemplified by postdiphtheritic polyneuritis.
Ann. Int. Med. 36:786-791.
White, J. C., and Sweet, W. H.
Effectiveness of chordotomy in phantom pain after amputation.
A.M.A. Arch. Neurol. & Psychiat. 67:315-322.

Orthopedic Surgery

Joplin, R. J.
Backache.
In Cyclopedia of Medicine, Surgery and Specialties, Philadelphia, F. A. Davis Company, vol. 1, pp. 983-999.

Physical Medicine

Watkins, A. L.
Physical Medicine and athletic injuries. (Editorial)
Arch. Phys. Med. 33:239-241.
Watkins, A. L.
Research in Physical Medicine and Rehabilitation. (Editorial)
Brit. J. Phys. Med. 15:100-101.

The House Staff Aloha Party, sponsored jointly by the House Staff and the Distaff Clubs, was held Saturday evening, June 14, in the House Staff Club rooms. With technical advice given by Mrs. Alice Rudin, who is from the Territory, decorations were all in authentic Hawaiian tradition. One of the local airlines supplied colored posters for the occasion. The end room was converted into a dance floor, and rum punch with pineapple juice was served throughout the evening.

Among the House Staff members who are leaving in July and who attended the party were Betsy Aub, Max Rukes, and James Ferguson from Medicine, Doug Atherton from Urology, Ransom Arthur from Pediatrics, and Walt Theus from Dentistry. Because of other parties which had been planned earlier, a good number of the departing House Staff were unable to attend.

Another party is planned for the late summer, to introduce the new House Staff members to the organization.

We have long been bothered by the erroneous use of the term House Officers when the intention was to include both the Interns and the Residents. This misuse has occurred more frequently since the Penthouse has been made the headquarters of the House Staff Club. The term House Officers means the Interns, only, and the Residents should take vigorous exception to the already too firmly established habit of referring to the 14th floor quarters with a title that excludes them. In order to drive our point home, it seems worth while to review briefly this subject of titles for the two branches of the House Staff.

In 1821, when the General Hospital was opened, there were no surgical interns, and the single medical intern appointed each year was called the Apothecary. In 1829 their number was increased to two, they were relieved of their duties as Apothecaries, and were given the title of House Physician to identify them from the single House Surgeon who was then to be appointed to the House Staff each year. In 1846 the number of House Surgeons was increased to two, and so the quotas stood at two each until 1864.

In 1849 the title House Physician was changed to that of House Pupil. Dr. Washburn, in his *History of the Massachusetts General Hospital* gives us the complete story of the altercation which precipitated this decision. We quote from Chapter VIII, entitled "Residents, House Officers, Students":

". . . the Staff felt that the House Physicians and Surgeons were assuming too much authority in the care of the patients, and a committee was appointed by the Medical Board to consider 'the necessity of having so many resident officers at the Hospital.' The following vote was passed and transmitted to the Trustees:

> "Resolved — That the Board of Physicians and Surgeons of the Hospital beg leave respectfully to represent to the Trustees that in their opinion the situations of House Physician & House Surgeon would be better filled by Medical Pupils before graduation than at present they are by Medical Graduates. And also that these officers in the Reports &c of the Institution should be designated as Medical & Surgical House Pupils instead of by the title of Surgeon & Physician, as more clearly defining their subordinate position.

"On this letter appears a note signed by Nathaniel I. Bowditch, of the Trustees' Committee to whom the matter was referred:

> "The Committee of the Trustees report in favor of filling the offices in question with medical pupils of two years standing. What is lost from their having one year's less professional experience will be more than made up by their greater degree of docility & obedience. The proposed change of name is also acceded to, though the present names designate better than any other the exact relation which these young men hold to the Institution.

"The Trustees approved their committee's recommendation on November 18, 1849: 'Voted to make the change in name and qualifications of the House Officers suggested by the Physicians and Surgeons.'

"Thus, House Physicians and Surgeons became House Pupils. . . . The term 'House Pupil' was adopted to put the House Officers in their place. It became a title of honor, borne worthily by generation after generation of House Pupils – men who became leaders in the profession throughout our country."

By 1894 the number of House Pupils had been increased to eighteen, with both Medical and Surgical Services having their senior, junior, and out-patient men. It was the latter whose title was often abbreviated to "Pup", the better to keep uppermost in the minds of these young men their lowly position in the hospital hierarchy. Incidentally, the East Medical Pup, who lives on the table in the Archives Room, was given to Dr. Aub as a Christmas present in 1914 when he was one of our "Pups".

Now for a word about the Residents. The first Resident, in Surgery, was appointed in 1911. He is Dr. George W. Morse of 475 Commonwealth Avenue, Boston. It was not until 1913 that the first Residents in Medicine and Urology were appointed, 1915 for X-ray, 1918 for Children's Medicine, and 1926 before the other Services began gradually to have Residents on their staffs. The first Resident was given this title at the same time that the chief administrative officer of the Hospital, who had previously been called the Resident Physician, gave up that title to become known as the Director.

All of this to emphasize that down the years, from 1821 to the present time, the title House Officers has always been confined to the Interns. It seems to us that the simplest way to clear up the confusion is to eliminate entirely the term House Officer from our vocabularies and use only the title Intern for that group. It's shorter, anyway. However, if that isn't possible, let's remember that when we say House Officers we mean Interns, and that when we mean *both* House Officers (or Interns) and Residents we should use the term HOUSE STAFF.

As we finished writing the above account of Interns and Residents it occurred to us that Dr. George W. Morse himself, the first Resident ever to be appointed at M.G.H., might have something of interest to say. We found Dr. Morse very glad to cooperate, and within a day or so this letter from him arrived. We wish he had gone into greater detail. Maybe we will hear from him again some day.

> I have now reached the age of seventy and am seriously considering retiring from active work. As I look back over my many years in surgery, several interesting experiences come to mind. [It is those experiences we wish we might hear about. — *Editor*]
>
> I have enjoyed my work very much. I feel that I had excellent training and that my residency at the Massachusetts General Hospital in 1911 and 1912 was extremely valuable. During that time a great many difficult cases were turned over to me, especially the emergencies at night, and that experience gave me more confidence in myself than anything else that came my way during medical school or my internships.
>
> I was very fortunate in being the first Resident, in that I was associated with all the best and most prominent surgeons on all three surgical services (there was a South Surgical Service at that time, in addition to the East and West), and I assisted the chiefs of service in every unusual or difficult operation. I was fortunate enough to have assisted Dr. Maurice Richardson, Dr. Scudder, Dr. Porter, Dr. Balch, and Dr. Harrington, all of whom were the finest teachers I have ever had an opportunity to associate with. If I remember correctly, I had several hundred operations turned over to me, and although I was pretty well tired out at the end of my appointment, I feel that my residency at the Massachusetts General Hospital was a tremendous factor in what little success I have had in surgery.

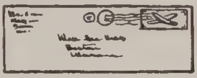
The Distaff Club wishes to welcome all the wives of the new House Staff members and the Fellows, and the new female doctors of the House Staff.

This club is a social group, whose purpose is to help the wives of new House Staff members and Fellows to make friends and to learn about recreational and educational opportunities which might interest them while their husbands are working.

We have meetings, with programs, about once a month. Future meetings will usually be held in the newly decorated House Staff Club rooms at the Hospital. There is a Distaff Club bulletin board in the Brick Corridor near the Hospital Post Office, with notices of interest to members. We have a member in charge of housing information who will help those who are looking for apartments or houses.

We hope you will be interested in joining the Distaff Club and will let us help you in any way we can. If we don't get in touch with you first, please communicate with one of our officers, whose names and telephone numbers are posted on the bulletin board.

We are planning a party in July to welcome new members. We hope you will all come.



A long-awaited letter has come from Dr. Chiu-an Wang (*W.S.* 1944) of 12-14 Queen's Road, Central, 306 Sze Hoi Building, Hong Kong, China. It reads, in part:

> I want to thank you for sending me a recent copy of THE NEWS, in which you recorded the change of our address. We have received THE NEWS every now and then from my brother, Dr. C. C. Wang, at present with the Department of Radiology at the M.G.H., and have always taken great interest in what it contained.
>
> Since our last return trip from the States in February 1950 (our previous one was in January 1947), we have made our home here in Hong Kong, where I have been in practice ever since.
>
> I have found my work here very interesting. There has been a vast amount of clinical material. My practice is mainly surgical, with the exception of obstetrics, but I have to do all kinds of medical work. We have many cancer cases and communicable diseases. As a matter of fact, both of our children have already been exposed to and have contracted measles and chickenpox.
>
> I hope you will not publish this in THE NEWS, for I have written in a very hasty manner and, moreover, my letter doesn't contain much of interest for your readers. [What a misconception! — *Editor*] What I meant to tell you is that I want to thank you for your kind thought of remembering us and to say that we have often thought of our friends over there.
>
> We look forward to having another opportunity of paying you all a visit in the near future.
>
> Kindest regards to all of you.

In response to an appeal for funds for the new House Staff Club, Dr. Elmar S. Waring (*E.M.* 1919) sent, in addition to his check, this cordial note:

> At the HMS Alumni Dinner in 1943, I believe I had the biggest family — certainly of the Class of '18—and a grandson on the way; now 7 and 5.

THE MAIN LOUNGE – HOUSE STAFF CLUB ROOMS

If any MGH House Staff-ers come even as near me as Washington (15 miles away), I wish they'd come out and dine with us.

One of the most interesting letters to reach us in a long time has come from Capt. Lloyd H. Smith, Jr., MC, USAR (*M.* 1949) – better known here at M.G.H. as Holly Smith. The letter, with date line April 28, 11th Evacuation Hospital, APO 301, c/o Postmaster, San Francisco, must, we regret to say, be withheld until our next issue because of space limitations. The letter contains news concerning several MGH-ers and should appear in its entirety.

We are always particularly grateful when something unsolicited arrives for THE NEWS. This voluntary contribution has come from Mr. Charles H. W. Foster, one of our Corporation members.

Preliminary to a meeting of the Class of 1912 of the Harvard Medical School, held at the Ship's Cabin in Marblehead, I had a bit of research done to find out what pet names were given to doctors aboard ship by sailors "in ye olden times". Here are all the names that can be used by a lady, as well as by a man. With a rising inflection they mean pleasure; with a falling one, the reverse. I am sure they will be useful for family or hospital use.

New addresses: —

Dr. Anthony A. Arzimanoglou (a.r.s. *Or.* 1952), Lakeville State Sanatorium, Middleboro, Mass.
Dr. Benjamin A. Barnes (*W.S.* 1945), Uplands Farm, Cold Spring Harbor, Long Island, N. Y.
Dr. Glenn E. Behringer (*W.S.* 1946), 266 Beacon St., Boston, Mass.
Dr. James M. Davis, Jr. (*S.* 1948), 1819 Goodwin St., Jacksonville, Fla.
Dr. W. Sterling Edwards (*W.S.* 1946), Medical College of Alabama, Birmingham, Ala.
Dr. Carl W. Gottschalk (*M.* 1946), Department of Medicine, University of North Carolina, Chapel Hill, N. C.
Dr. James E. Kreisle (*W.M.* 1943), Longview Ave., Austin, Tex.
Dr. Saul W. Levy (a.r.p. *D.* 1951), University of California Hospital, Medical Center, San Francisco 22, Calif.
Dr. John E. McKeigue (a. *Otolar.*), 520 Commonwealth Ave., Boston, Mass.
Dr. John McL. Morris (*E.S.* 1942), Yale University School of Medicine, Department of Gynecology, 789 Howard St., New Haven, Conn.
Dr. Pauline Owyang (*C.M.* 1943), 4797 Telegraph Ave., Oakland 9, Calif.
Lt. Paul S. Russell, Jr., MC, USAFR (*S.* 1949), 3605th Medical Group, Ellington A.F.B., Houston, Tex.
Dr. Samuel R. Schuster (a.r.s. 1952), Children's Hospital, 300 Longwood Ave., Boston, Mass.
Major Donald W. S. Stiff, MC, USA (r.p. *R.* 1950), Osaka Army Hospital, APO 1007, c/o Postmaster, San Francisco, Calif.

Brief bits: —

Dr. Edward B. Benedict, Endoscopist on our Staff, presented a paper written by him and Dr. Walter F. Lever, Assistant Dermatologist at M.G.H., at the meeting of the American Bronchoesophagological Association in Toronto in May. The subject of the paper was "Stenoses of the esophagus in benign mucous membrane pemphigus".

Dr. Mary A. B. Brazier, Neurophysiologist on our Anesthesia, Neurology, and Psychiatry Services, was elected Vice-President and President-elect of the American Electroencephalographic Society at their Annual Meeting in May.

Dr. Bradford Cannon, Associate Visiting Surgeon at M.G.H., was recently re-elected Secretary-Treasurer of the American Board of Plastic Surgery. On May 8, Dr. Cannon presented a paper entitled "The place of the plastic surgeon in Medicine" before the Annual Meeting of the Rhode Island Medical Society. He also presented a paper on "Further observations on the use of the split vermilion bordered lip flap" at the Annual Meeting of the American Association of Plastic Surgeons, held in St. Louis May 21-23.

Dr. Donald S. King, a member of our Board of Consultation, was made President-elect of the American Trudeau Society, Medical Section of the National Tuberculosis Association, at the 48th Annual Meeting of the Association, held in Boston in May.

THE NEWS

No. 115 Boston, Mass. September 1952

MEDICAL SERVICE AFFAIRS

From its beginning the Massachusetts General Hospital has been fortunate in having its share of distinguished physicians and surgeons. The first of these able and devoted men, and those of like spirit and zeal who followed, so shaped the spiritual, intellectual, and physical growth of the Hospital that it was destined to become one of the leading medical centers in this country. The success of their labors, when measured in terms of medical care, teaching, and research, is evident in the many activities of our present Hospital community. In addition, there exists within its walls a most unusual spirit. Though difficult to define, it is unique and all-pervading.

In rendering my first report on Medical Service affairs I wish to pay personal tribute, as well as to express the gratitude and affection of the medical staff, to Dr. James Howard Means, Chief of the Medical Services and Jackson Professor of Clinical Medicine from 1923 to 1951. He, like many of the distinguished physicians of the last century, brought added renown to the Hospital. As his first resident physician I came to know him as both friend and mentor. This marked the beginning of a long and intimate association, interrupted only by my year abroad and my leave of absence during the recent war years. I soon learned of his devotion to the Hospital and the happiness he derived from administering the Medical Services. That he was pro-M.G.H. there can be no doubt.

He first knew the Hospital as a medical student and upon graduation in 1911 became an East Medical house officer. From then until June 30, 1951, he was an active member of the Hospital community. Because of his long association with the Hospital, his knowledge of its past, his intense devotion to the institution, his interest and ability as an administrator, teacher, and investigator, he was ably suited for the position in which he served with such distinction for 28 years. His heart was in his work; he spurned private practice and the rewards thereof in order to give his whole and undivided attention to the job at hand.

He was an ardent advocate of any cause which he believed would enhance the Hospital's role in furthering medical practice and the advancement of medical knowledge. He was ever mindful of the institution's responsibilities as an active member of the Harvard Medical School community, and always emphasized that the Hospital's treble function was care of patients, teaching, and research. His interest in Medical School affairs was equally great. He was long a proponent of experimentation in medical education and favored a radical change in the curriculum. Being a man of deep conviction, he never faltered in stating his position in matters medical and stood ready to champion any movement which would better either the Hospital or the School.

The many changes which took place during his period of tenure were recorded by Dr. Paul D. White in the July-August 1951 issue of THE NEWS. This short historical summary documents the vital contributions made by Howard Means and indicates the increasingly important role the Hospital has come to play in medical care, teaching, and research. Again, our thanks to Dr. Means. We all wish him happiness and success in the years that lie ahead at our friendly, neighboring institution, the Massachusetts Institute of Technology.

On reviewing the affairs of the Medical Service for the past year the writer has become more fully aware of its past record of accomplishment and its challenging future. Though new and unforeseen problems may arise on the American medical scene, our chief concern – Better Medical Care – must remain foremost in our minds. The component parts of this common objective or central theme must remain the same: care of patients, teaching, and research. Though the accomplishment of this goal is implicit in good medical practice and in the training of future physicians, its execution is difficult – difficult because of the scope of modern medicine and the ever-emerging body of knowledge, seemingly at an ever-increasing tempo, which must be incorporated in this central theme. Its execution will be further influenced by various social and economic factors, some of which are already at hand.

When Howard Means turned over his administrative duties on June 30, 1951, the Medical Service, to use his own words, was "going strong". The few changes initiated during the past year, though in themselves minor, further our common objective – optimal medical care.

The house staff organization, so important in both the care of the patients and in teaching, has remained unchanged, with twelve house officers, eleven assistant residents, four residents, and one chief resident. The contributions made by this enthusiastic segment of our hospital staff have been due in large part to the devoted work and able leadership of the chief residents – first Dr. Isaac M. Taylor, and since January Dr. Evan Calkins. They have been most conscientious and enthusiastic in discharging their duties and in guiding the many activities of the service. To date, no house staff appointment has been interrupted by call to the Armed Services. Our situation for the coming year, however, may be less favorable.

We all regret that the broadening of the house and hospital staff that comes from accepting interns from other medical schools received a set-back this year. A number of outstanding applicants from other schools were unable to accept internships at our hospital for 1952-53 because of the decision of a number of large teaching hospitals to make commitments to students prior to the official date established for the new "matching plan" for interns. It is hoped that the principle of simultaneous acceptance of applicants by all hospitals will receive more widespread support this coming year.

Two changes, which affect primarily the house officers and the resident staff but also increase the educational value of our patients for physicians and students at all levels, were instituted. The weekly service (death) meetings, formerly attended by the residents alone, were thrown open to the entire house staff and other interested persons, including ward visiting physicians, consultants appropriate to the cases in question, and visitors from abroad. The discussion of the cases within this group with the pathologists in attendance has proved to be stimulating and informative. All members of the staff are invited to attend these exercises, which are held each Wednesday at 4:30 P.M. in the Medical Staff Room. The other change relates to the house staff activities in the private pavilions, particularly the Baker. Due largely to the efforts of Drs. Walter T. St. Goar and William R. Owen, at least two organized conferences with staff physicians and surgeons have been held each week since the first of the year. Efforts have also been made to permit the house staff to follow the patients with staff physicians and to participate more actively in their care.

The success achieved by these minor changes in the private pavilions prompted the appointment of a committee to study the medical service affairs in the private pavilions. Under the chairmanship of Dr. Bland, this committee (consisting of Drs. Myles P. Baker, Calkins, Ellis, Kranes, Neumann, Owen, and St. Goar) has reviewed the problem thoroughly from the point of view of the house staff, the private patient, and the visiting physician. It is obvious from their report and the accompanying recommendations that any plan for the future reorganization of the private medical service must proceed slowly. The only additional measures instituted to date have been the biweekly meetings to review the deaths in the Baker and the Phillips House, and the appointment of Dr. Baker as director and coordinator of this new program. During this first year he will attempt to determine by means of the trial-and-error method what can be accomplished in terms of better medical care and of more effective teaching and training of house staff. It is hoped that encouraging developments along these lines can be reported a year or two hence.

One minor change has been introduced with regard to the education of all of us. Medical Grand Rounds, held in the Lower Out-Patient Amphitheatre during the postwar years, has been moved back to the Ether Dome, where the atmosphere has proved to be more conducive to informal and spirited discussion among the staff.

A number of efforts have been made to improve the teaching of fourth year medical students. These include: establishment of an informal weekly conference with the chief of the medical services on a variety of subjects of the students' own choosing; institution of a second weekly conference with younger staff members on the physiology and clinical management of certain diseases; and more rapid screening of out patients by the residents in order to provide students with selected cases at an earlier hour in the morning. In order to improve further our fourth year teaching it is planned during the year 1952-53 to assign one resident to each of the Bulfinch wards instead of requiring one resident to cover two wards as previously. He will act as tutor to the students on his ward and will devote a good portion of his time to teaching.

The Social Service Department continues to contribute its share to our teaching program and other service activities. The medico-social conferences held weekly on each ward service acquaint both students and house staff with the many problems relating to total medical care. Miss Dorothy Kellogg, the social service representative, performs most expertly at the biweekly medical-psychiatric conferences as teacher and counselor of students in relating the role of social and economic factors in disease.

The care of the house patients remains at a high level. Here the talents of all are brought to bear – house staff, visiting physicians, specialists, and members of the many important ancillary services. The house staff has become increasingly aware of the rising cost of medical care and what it means to the family pocketbook, especially for those patients without the benefits of Blue Cross. They are also more mindful of the Hospital's responsibility in rendering excellent medical care, and are well indoctrinated in the principle that the patient's safety and comfort come first, irrespective of the cost.

An assistant resident remains in charge of each of the medical wards, with the visiting physician serving as his mentor, consultant, and advisor. When the assistant resident is permitted to serve as the captain of the ward team he is in a more strategic position to provide continuity of medical care and can do a better job of maintaining a good doctor-patient relationship. This desired care of patients can be most nearly achieved when all concerned with ward-patient care, including consultants and representatives of special clinics, transmit information concerning individual patients directly to the assistant resident in charge of the ward. The effects of failure to adhere to this important principle of good medical care are occasionally brought into focus in the weekly medico-social conferences.

In order to provide ward opportunities for more members of the staff during the coming year, twelve of the forty-eight months of ward visiting will be assigned as single month visits. This system will have the added advantage of providing more contacts between the student-house staff group and our large visiting staff, who bring to the wards many points of view and skills that have direct bearing upon both the science and the art of medical practice. The relative merits of this system and those of a smaller visiting staff will be assessed one year hence.

Each year some of our house staff, clinical and research fellows, and graduate students join the staffs of our sister institutions, carrying the gospel of the M.G.H. with them. Through this process we have lost during the year Dr. Ernest Craige, r.p. 1948, an active member of our staff and the cardiac group. Dr. Craige, along with Drs. Isaac M. Taylor, c.r.p. 1951, and Carl W. Gottschalk, r.p. 1951, has accepted an appointment with Dr. Charles H. Burnett, c.r.p. 1946, Professor of Medicine and Chief of the Medical Services, University of North Carolina Hospital, Chapel Hill, North Carolina. With the opening of the new hospital this fall the University of North Carolina will have available for the first time all facilities needed for a four-year medical school. Dr. Burnett and his fellow MGH graduates have been busily engaged in recent months making ready for a new house staff and their first clinical clerks. We are proud of this MGH group and wish them every success in this new and exciting assignment.

During January 1952, Dr. W. Melville Arnott, Professor of Medicine at the University of Birmingham and the Queen Elizabeth Hospital, Birmingham, England, served as Honorary Associate Physician pro tempore. He was followed in April 1952 by Dr. René S. Mach, Lecturer on Medicine, Medical School, University of Geneva, and Physician at the University Hospital, Geneva, Switzerland, who likewise served as a pro tempore member of our staff. These distinguished physicians contributed generously of their knowledge and added greatly to the education of our house staff.

Dr. Earle M. Chapman, who continues in charge of the Medical Out-Patient Department, has acquainted me with the affairs of this important division of the Medical Service. Though the discrepancy between ward and out-patient care of twenty years ago has been lessened, much still remains to be accomplished. The problem of better ambulatory medical care in teaching hospitals is not a new one, nor is there an easy solution. It is hoped that a plan can be evolved that will further improve the quality of medical care rendered in the Out-Patient Department. Any plan which is to be more effective must have educational content. That new quarters will be required there can be no doubt. Perhaps all of us should devote some time to this most important area of medical practice and teaching.

I am glad to announce that Ward 4 is currently being altered through the added generosity of Mr. Edward Mallinckrodt. The alterations will include a more spacious kitchen, an enlarged nurses' station, a bay for conferences, a new treatment room, increased utility room space, a small lounge for patients, and new furnishings. These changes will provide better facilities for both patients and physician-investigators.

To attempt to detail the research activities of the service would require a separate report. The ever-present problem is one of space. This being true of all services, the allocation of laboratory space has become an all-hospital affair. The laboratories vacated with the advent of the new Research Building have been greatly in demand. All requests were deferred until the needs of the hospital's Chemistry Laboratory were defined and until the Department of Bacteriology had reclaimed its locum tenens space. Now that this has been effected, the needs of others will be met within the limits of the space available.

Since the establishment of the Committee on Research, more of our research activities have become all-hospital enterprises. For example, the Physics Laboratory (Dr. Brownell), the new Cardiovascular Research Unit (Dr. Frantz), and the Infectious Disease Laboratory (Dr. Paine) are underwritten by the Massachusetts General Hospital Research Fund. Such units strengthen both the Hospital and the individual services. Undoubtedly, certain of our service functions, such as better ambulatory care and the contemplated home care program, must become all-hospital enterprises if the institution is to fulfill more completely its role in greater community service. Many of the full- and part-time members of all services have shown that they are keenly interested in and desirous of participating in these and other plans concerning the Hospital's future. Such cooperation bids well for our future.

Walter Bauer, M.D.,
Chief of Medical Services

Dr. Fuller Albright, Physician on our Staff, was elected a member of the National Academy of Sciences at its Annual Meeting in Washington last April. He is in the section of Pathology and Bacteriology. It is our understanding that only a very small number of clinical investigators – possibly no more than two or three – have ever been so honored by the Academy.

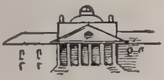
Dr. Arthur W. Allen, a member of our Board of Consultation, was the recipient of an honorary degree as Doctor of Science from Harvard last June. The award recognizes Dr. Allen as: "A leader of the medical profession, in the front rank of those who wield the knife for the benefit of suffering humanity."

Mr. Francis C. Gray, Chairman of our Board of Trustees, was awarded the honorary degree of Doctor of Commercial Science by Suffolk University at its Annual Commencement Exercises last June.

Miss Ruth Sleeper, Director of our School of Nursing and Nursing Service, has been elected President of the newly created organization called the National League for Nursing, to be composed of nurses, private citizens, and public groups interested in nursing. This new organization is a combination of five former nursing associations, including the National League of Nursing Education, the National Organization of Public Health Nursing, and the Association of Collegiate Schools of Nursing.

Members of the health profession are watching with great interest the pattern which has now been set by the nursing profession in their plan for reorganization, which emphasizes the importance of sharing problems with the consumer in order to improve health service.

Dr. Paul D. White, a member of our Board of Consultation, has carried out that plan of his to measure a whale's heartbeat. Together with Dr. Robert King of Seattle, President of the American Heart Association, Mr. James Jenks, President of the Sanborn Company of Cambridge, and a crew to man the whaleboat, Dr. White succeeded in getting for the first time in history, an electrocardiograph of the heartbeat of the whale, while the huge animal which had been harpooned and the whaleboat carrying the members of the expedition tore through the rough seas off the Alaskan coast.



The Board of Trustees, at their meetings on June 13 and 27, and July 18, voted:

To accept the resignation of Mrs. Donald V. Baker, Jr. from the Ladies' Advisory Committee of the School of Nursing;

To accept the resignation of Dr. John McL. Morris as Assistant in Surgery;

To promote Dr. Thornton Brown from Assistant in Orthopedic Surgery to Assistant Orthopedic Surgeon, effective July 1;

To promote Dr. David Littmann to Clinical Associate in Medicine;

To grant leave of absence to Drs. Robert E. Scully and Austin L. Vickery from the Pathology Staff, effective during their anticipated periods of military service.

To appoint:

Dr. Theodore L. Badger as Clinical Associate in Medicine;

Dr. Edgar L. Gasteiger, Jr. as Research Associate in Neurosurgery for one year, beginning July 1;

Dr. Pierre Gauthier-Lafaye as a Fellow in Anesthesia, beginning August 1;

Dr. John F. Gibbons as Assistant Radiologist, beginning September 1;

Dr. Robert G. Greene as Assistant Resident in Orthopedic Surgery for one year, beginning January 1, 1953;

Dr. Ruth C. Haynes as Assistant Resident in Anesthesia for one year, beginning August 1, 1953;

Dr. John E. LeDonne as Assistant in Dermatology, as of July 1;

Dr. Robert W. Mackie (Commander, U. S. Navy) as First Assistant Resident in Neurosurgery for one year, beginning July 1;

Gershen Rosenblum as Assistant Psychologist, assigned to Psychiatry, for one year, beginning July 1;

Dr. Harry W. Rudel as Third Assistant Resident in Pathology, for the year beginning July 1;

Karl Schmid, Ph.D. as Assistant Biochemist, assigned to Medicine, for one year, beginning July 1;

Dr. Robert B. Sloane as Assistant Resident in Psychiatry for six months, beginning January 1, 1953;

Morris Soodak, Ph.D. as Assistant Biochemist, to be made retroactive to January 1;

Dr. Bernard B. Stone as Second Assistant Resident in Neurosurgery for one year, beginning July 1.

To make the following changes in effective dates of appointments as Assistant Residents:

Dr. James B. Field, Assistant Resident in Medicine, effective July 1 instead of October 1;

Dr. Stephen M. Krane, Assistant Resident in Medicine, effective July 1 instead of October 1;

Dr. Avrum B. Organick, Assistant Resident in Medicine, effective October 1 instead of July 1;

Dr. Robert H. Walker as Second Assistant Resident in Surgery, effective June 1 instead of July 1.

At their meetings on June 13 and July 16, the General Executive Committee voted:

To accept the resignation of Dr. Donald O. Rudin as Research Fellow in Anesthesia;

To reappoint Dr. Vernon H. Mark as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1.

To appoint:

Dr. Edwin R. Bickerstaff as Research Fellow in Neurology, for the period March 1 through December 31;

Dr. William C. Doust as Clinical Fellow in Psychiatry for one year, beginning September 1;

Dr. Belton G. Griffin as Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, for the period July 1 through October 31;

Dr. Carleton R. Haines as Clinical and Research Fellow in Surgery, assigned to the Tumor Clinic, for one year, beginning July 15;

Dr. Harold J. Harris as Clinical Fellow in Psychiatry for one year, beginning September 1, to work in Child Psychiatry;

Dr. Robert Kagan as Clinical Fellow in Psychiatry, beginning July 1, to work in Child Psychiatry;

Dr. John W. Keller as Clinical and Research Fellow in Medicine for one year, effective July 1;

Dr. Joseph E. Murray as Clinical Assistant in Surgery, assigned to Plastic Surgery, as of July 1;

Dr. Burton C. Prior as Clinical Fellow in Radiology, beginning January 1, 1953;

Dr. Warren B. Weil as Clinical Fellow in Pathology, beginning on or about October 1.

At meetings earlier in the year, the General Executive Committee voted:

To promote Dr. Manucher Javid to the position of Resident in Neurosurgery, effective as of January 1;

To promote Dr. Leon Reznick to the position of Resident in Dermatology, effective as of July 1;

To appoint Dr. Louis J. Borel as Clinical and Research Fellow in Medicine, to work with Dr. Dienes, for six months, beginning September 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Allergy

Burrage, W. S., Irwin, J. W., and Gibson, J. S.
Maintenance cortisone in severe bronchial asthma.
J. Allergy 23:310-321.

Anesthesia

Beecher, H. K.
Some problems of acid-base equilibrium during anesthesia with particular reference to thoracic surgery.
Anesth. et analg. 9, supp. 1:1-7.

French, A. B., Barss, T. P., Fairlie, C. S., Bengle, A. L., Jr., Jones, C. M., Linton, R. R., and Beecher, H. K.
Metabolic effects of anesthesia in man: V. A comparison of the effects of ether and cyclopropane anesthesia on the abnormal liver.
Ann. Surg. 135:145-163.

Keats, A. S., and Beecher, H. K.
Analgesic activity and toxic effects of acetylmethadol isomers in man.
J. Pharmacol. & Exper. Therap. 105:210-215.

Keats, A. S., and Beecher, H. K.
Analgesic potency and side action liability in man of Heptazone, WIN 1161-2, 6-methyl dihydromorphine, metopon, levo-isomethadone and pentobarbital sodium, as a further effort to refine methods of evaluation of analgesic drugs.
J. Pharmacol. & Exper. Therap. 105:109-129.

Cardiology

Clark, R. J., and White, P. D.
Congenital aneurysmal defect of the membranous portion of the ventricular septum associated with heart block, ventricular flutter, Adams-Stokes syndrome and death.
Circulation 5:725-729.

General Surgery

Churchill, E. D.
Evarts Graham–Early years and the hegira.
Ann. Surg. 136:3-11.

Churchill, E. D.
The physiologic basis of wound-shock.
Tufts M. J. 19:3-6.

tuted to date have been the biweekly meetings to review the deaths in the Baker and the Phillips House, and the appointment of Dr. Baker as director and coordinator of this new program. During this first year he will attempt to determine by means of the trial-and-error method what can be accomplished in terms of better medical care and of more effective teaching and training of house staff. It is hoped that encouraging developments along these lines can be reported a year or two hence.

One minor change has been introduced with regard to the education of all of us. Medical Grand Rounds, held in the Lower Out-Patient Amphitheatre during the postwar years, has been moved back to the Ether Dome, where the atmosphere has proved to be more conducive to informal and spirited discussion among the staff.

A number of efforts have been made to improve the teaching of fourth year medical students. These include: establishment of an informal weekly conference with the chief of the medical services on a variety of subjects of the students' own choosing; institution of a second weekly conference with younger staff members on the physiology and clinical management of certain diseases; and more rapid screening of out patients by the residents in order to provide students with selected cases at an earlier hour in the morning. In order to improve further our fourth year teaching it is planned during the year 1952-53 to assign one resident to each of the Bulfinch wards instead of requiring one resident to cover two wards as previously. With the opening of the new hospital this fall the University of North Carolina will have available for the first time all facilities needed for a four-year medical school. Dr. Burnett and his fellow MGH graduates have been busily engaged in recent months making ready for a new house staff and their first clinical clerks. We are proud of this MGH group and wish them every success in this new and exciting assignment.

During January 1952, Dr. W. Melville Arnott, Professor of Medicine at the University of Birmingham and the Queen Elizabeth Hospital, Birmingham, England, served as Honorary Associate Physician pro tempore. He was followed in April 1952 by Dr. René S. Mach, Lecturer on Medicine, Medical School, University of Geneva, and Physician at the University Hospital, Geneva, Switzerland, who likewise served as a pro tempore member of our staff. These distinguished physicians contributed generously of their knowledge and added greatly to the education of our house staff.

Dr. Earle M. Chapman, who continues in charge of the Medical Out-Patient Department, has acquainted me with the affairs of this important division of the Medical Service. Though the discrepancy between ward and out-patient care of twenty years ago has been lessened, much still remains to be accomplished. The problem of better ambulatory medical care in teaching hospitals is not a new one, nor is there an easy solution. It is hoped that a plan can be evolved that will further improve the quality of medical care rendered in the Out-Patient Department. Any plan which is to be more effective must have educational content. That new quarters will be required there can be no doubt. Perhaps all of us should devote some time to this most important area of medical practice and teaching.

I am glad to announce that Ward 4 is currently being altered through the added generosity of Mr. Edward Mallinckrodt. The alterations will include a more spacious kitchen, an enlarged nurses' station, a bay for conferences, a new treatment room, increased utility room space, a small lounge for patients, and new furnishings. These changes will provide better facilities for both patients and physician-investigators.

To attempt to detail the research activities of the service would require a separate report. The ever-present problem is one of space. This being true of all services, the allocation of laboratory space has become an all-hospital affair. The laboratories vacated with the advent of the new Research Building have been greatly in demand. All requests were deferred until the needs of the hospital's Chemistry Laboratory were defined and until the Department of Bacteriology had reclaimed its locum tenens space. Now that this has been effected, the needs of others will be met within the limits of the space available.

Since the establishment of the Committee on Research, more of our research activities have become all-hospital enterprises. For example, the Physics Laboratory (Dr. Brownell), the new Cardiovascular Research Unit (Dr. Frantz), and the Infectious Disease Laboratory (Dr. Paine) are underwritten by the Massachusetts General Hospital Research Fund. Such units strengthen both the Hospital and the individual services. Undoubtedly, certain of our service functions, such as better ambulatory care and the contemplated home care program, must become all-hospital enterprises if the institution is to fulfill more completely its role in greater community service. Many of the full- and part-time members of all services have shown that they are keenly interested in and desirous of participating in these and other plans concerning the Hospital's future. Such cooperation bids well for our future.

Walter Bauer, M.D.,
Chief of Medical Services

Dr. Fuller Albright, Physician on our Staff, was elected a member of the National Academy of Sciences at its Annual Meeting in Washington last April. He is in the section of Pathology and Bacteriology. It is our understanding that only a very small number of clinical investigators – possibly no more than two or three – have ever been so honored by the Academy.

Dr. Arthur W. Allen, a member of our Board of Consultation, was the recipient of an honorary degree as Doctor of Science from Harvard last June. The award recognizes Dr. Allen as: "A leader of the medical profession, in the front rank of those who wield the knife for the benefit of suffering humanity."

Mr. Francis C. Gray, Chairman of our Board of Trustees, was awarded the honorary degree of Doctor of Commercial Science by Suffolk University at its Annual Commencement Exercises last June.

Miss Ruth Sleeper, Director of our School of Nursing and Nursing Service, has been elected President of the newly created organization called the National League for Nursing, to be composed of nurses, private citizens, and public groups interested in nursing. This new organization is a combination of five former nursing associations, including the National League of Nursing Education, the National Organization of Public Health Nursing, and the Association of Collegiate Schools of Nursing.

Members of the health profession are watching with great interest the pattern which has now been set by the nursing profession in their plan for reorganization, which emphasizes the importance of sharing problems with the consumer in order to improve health service.

Dr. Paul D. White, a member of our Board of Consultation, has carried out that plan of his to measure a whale's heartbeat. Together with Dr. Robert King of Seattle, President of the American Heart Association, Mr. James Jenks, President of the Sanborn Company of Cambridge, and a crew to man the whaleboat, Dr. White succeeded in getting for the first time in history, an electrocardiograph of the heartbeat of the whale, while the huge animal which had been harpooned and the whaleboat carrying the members of the expedition tore through the rough seas off the Alaskan coast.

The Board of Trustees, at their meetings on June 13 and 27, and July 18, voted:

To accept the resignation of Mrs. Donald V. Baker, Jr. from the Ladies' Advisory Committee of the School of Nursing;
To accept the resignation of Dr. John McL. Morris as Assistant in Surgery;
To promote Dr. Thornton Brown from Assistant in Orthopedic Surgery to Assistant Orthopedic Surgeon, effective July 1;
To promote Dr. David Littmann to Clinical Associate in Medicine;
To grant leave of absence to Drs. Robert E. Scully and Austin L. Vickery from the Pathology Staff, effective during their anticipated periods of military service.

To appoint:

Dr. Theodore L. Badger as Clinical Associate in Medicine;
Dr. Edgar L. Gasteiger, Jr. as Research Associate in Neurosurgery for one year, beginning July 1;
Dr. Pierre Gauthier-Lafaye as a Fellow in Anesthesia, beginning August 1;
Dr. John F. Gibbons as Assistant Radiologist, beginning September 1;
Dr. Robert G. Greene as Assistant Resident in Orthopedic Surgery for one year, beginning January 1, 1953;
Dr. Ruth C. Haynes as Assistant Resident in Anesthesia for one year, beginning August 1, 1953;
Dr. John E. LeDonne as Assistant in Dermatology, as of July 1;
Dr. Robert W. Mackie (Commander, U. S. Navy) as First Assistant Resident in Neurosurgery for one year, beginning July 1;
Gershen Rosenblum as Assistant Psychologist, assigned to Psychiatry, for one year, beginning July 1;
Dr. Harry W. Rudel as Third Assistant Resident in Pathology, for the year beginning July 1;
Karl Schmid, Ph.D. as Assistant Biochemist, assigned to Medicine, for one year, beginning July 1;
Dr. Robert B. Sloane as Assistant Resident in Psychiatry for six months, beginning January 1, 1953;
Morris Soodak, Ph.D. as Assistant Biochemist, to be made retroactive to January 1;
Dr. Bernard B. Stone as Second Assistant Resident in Neurosurgery for one year, beginning July 1.

To make the following changes in effective dates of appointments as Assistant Residents:

Dr. James B. Field, Assistant Resident in Medicine, effective July 1 instead of October 1;
Dr. Stephen M. Krane, Assistant Resident in Medicine, effective July 1 instead of October 1;
Dr. Avrum B. Organick, Assistant Resident in Medicine, effective October 1 instead of July 1;
Dr. Robert H. Walker as Second Assistant Resident in Surgery, effective June 1 instead of July 1.

At their meetings on June 13 and July 16, the General Executive Committee voted:

To accept the resignation of Dr. Donald O. Rudin as Research Fellow in Anesthesia;
To reappoint Dr. Vernon H. Mark as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1.

To appoint:

Dr. Edwin R. Bickerstaff as Research Fellow in Neurology, for the period March 1 through December 31;
Dr. William C. Doust as Clinical Fellow in Psychiatry for one year, beginning September 1;
Dr. Belton G. Griffin as Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, for the period July 1 through October 31;
Dr. Carleton R. Haines as Clinical and Research Fellow in Surgery, assigned to the Tumor Clinic, for one year, beginning July 15;
Dr. Harold J. Harris as Clinical Fellow in Psychiatry for one year, beginning September 1, to work in Child Psychiatry;
Dr. Robert Kagan as Clinical Fellow in Psychiatry, beginning July 1, to work in Child Psychiatry;
Dr. John W. Keller as Clinical and Research Fellow in Medicine for one year, effective July 1;
Dr. Joseph E. Murray as Clinical Assistant in Surgery, assigned to Plastic Surgery, as of July 1;
Dr. Burton C. Prior as Clinical Fellow in Radiology, beginning January 1, 1953;
Dr. Warren B. Weil as Clinical Fellow in Pathology, beginning on or about October 1.

At meetings earlier in the year, the General Executive Committee voted:

To promote Dr. Manucher Javid to the position of Resident in Neurosurgery, effective as of January 1;
To promote Dr. Leon Reznick to the position of Resident in Dermatology, effective as of July 1;
To appoint Dr. Louis J. Borel as Clinical and Research Fellow in Medicine, to work with Dr. Dienes, for six months, beginning September 1.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Allergy

Burrage, W. S., Irwin, J. W., and Gibson, J. S.
Maintenance cortisone in severe bronchial asthma.
J. Allergy 23:310-321.

Anesthesia

Beecher, H. K.
Some problems of acid-base equilibrium during anesthesia with particular reference to thoracic surgery.
Anesth. et analg. 9, supp. 1:1-7.

French, A. B., Barss, T. P., Fairlie, C. S., Bengle, A. L., Jr., Jones, C. M., Linton, R. R., and Beecher, H. K.
Metabolic effects of anesthesia in man: V. A comparison of the effects of ether and cyclopropane anesthesia on the abnormal liver.
Ann. Surg. 135:145-163.

Keats, A. S., and Beecher, H. K.
Analgesic activity and toxic effects of acetylmethadol isomers in man.
J. Pharmacol. & Exper. Therap. 105:210-215.

Keats, A. S., and Beecher, H. K.
Analgesic potency and side action liability in man of Heptazone, WIN 1161-2, 6-methyl dihydromorphine, metopon, levo-isomethadone and pentobarbital sodium, as a further effort to refine methods of evaluation of analgesic drugs.
J. Pharmacol. & Exper. Therap. 105:109-129.

Cardiology

Clark, R. J., and White, P. D.
Congenital aneurysmal defect of the membranous portion of the ventricular septum associated with heart block, ventricular flutter, Adams-Stokes syndrome and death.
Circulation 5:725-729.

General Surgery

Churchill, E. D.
Evarts Graham—Early years and the hegira.
Ann. Surg. 136:3-11.

Churchill, E. D.
The physiologic basis of wound-shock.
Tufts M. J. 19:3-6.

Churchill, E. D.
The shock frog. (Editorial)
Ann. Surg. 135:573-576.

Cope, O.
The role of ACTH and cortisone in the treatment of shock.
J. Indiana M. A. 45:485-492.

Dwight, R. W., and Ratcliffe, J. W.
Aneurysm of the hepatic artery: Report of a case treated by wiring.
Surgery 31:915-921.

Laboratory Science

Nardi, G. L.
Distribution and dosage of radiocarbon in the tissues.
Am. J. Roentgenol. 67:989-990.

Neurology, Neurosurgery, and Psychiatry

Bakay, L.
Studies on the absorption of dyes and radioactive phosphorus into the brain from the cerebrospinal fluid.
Zentralbl. f. Neurochirurgie 12:15-22.

Bakay, L., and Sweet, W. H.
Cervical and intracranial intra-arterial pressures with and without vascular occlusion.
Surg., Gynec. & Obst. 95:67-75.

Lindemann, E., and Clarke, L. D.
Modifications in ego structure and personality reactions under the influence of the effects of drugs.
Am. J. Psychiat. 108:561-567.

Michelsen, J. J.
Neurologic manifestations following spinal anesthesia.
Neurol. 2:255-259.

Neurophysiology

Brazier, M. A. B., and Casby, J. U.
Crosscorrelation and autocorrelation studies of electroencephalographic potentials.
EEG & Clin. Neurophysiol. 4:201-211.

Otolaryngology

Macmillan, A. S., and Kelemen, G.
Radiography of the supraglottic speech organs.
A.M.A. Arch. Otolaryng. 55:671-688.

Pathology

Scully, R. E., and Coffin, D. L.
Canine testicular tumors: With special reference to their histogenesis, comparative morphology, and endocrinology.
Cancer 5:592-605.

Physical Medicine

Watkins, A. L.
Medical progress: Current trends in physical medicine and rehabilitation.
New England J. Med. 247:91-97.

Radiology

Klein, A., Joplin, R. J., Reidy, J. A., and Hanelin, J.
Slipped capital femoral epiphysis: Early diagnosis and treatment facilitated by "normal" roentgenograms.
J. Bone & Joint Surg. 34-A, No. 1:233-239.

Porter, E. C.
Relationship between the adrenal cortex and radiation sickness: A review of the literature and a presentation of new data.
Radiology 58:246-257.

Reeves, J. D.
Medical progress: Radiation therapy of carcinoma of the cervix: A review of fundamental considerations.
New England J. Med. 246:652-661.

Reyersbach, G. C., Hanelin, J., and Joplin, R. J.
Vitamin A intoxication: Report of a case.
New England J. Med. 246:978-980.

Surgery — Reconstructive

Kazanjian, V. H.
Bone transplanting to the mandible.
Am. J. Surg. 83:633-639.

Urology

Smith, G. G.
Interstitial cystitis.
J. Urol. 67:903-915.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Robert Russell Trotter, alumnus of the Infirmary, who has recently returned to the U.S. from nine months in Okinawa, has been appointed Harvard Instructor in Ophthalmic Research in the Howe Laboratory of Ophthalmology. Dr. Trotter will work with Dr. W. Morton Grant on a clinical evaluation of glaucoma, a program sponsored by the U.S. Public Health Service.

During his stay in Okinawa, Dr. Trotter conducted a survey of the incidence of ocular disease among the Ryukyuan natives. As a civilian Consultant in Ophthalmology for the Scientific Investigation of the Ryukyu Islands, sponsored by the Pacific Science Board of the National Research Council, Dr. Trotter saw a good deal of the medical facilities of the islands. His travels took him to villages not only on Okinawa but on the smaller islands of the Ryukyuan chain.

Dr. Trotter found that infectious eye diseases, such as conjunctivitis, trachoma, and keratitis, were widely prevalent in Okinawa. Antibiotics are rarely used there, the emphasis being on ocular irrigations and surgical treatment. There is also a surprising lack of refraction and few of the people wear glasses, even those who have had cataract extractions. There is some cultural antipathy toward spectacles, which seems strange in an area close to and, until recently, dominated by Japan.

During his stay in the Ryukyus, Dr. Trotter was entertained by several local medical societies and he spoke to their members on medical treatments in the U.S. One bit of information which amazed the Ryukyuan doctors was that concerning the free clinic service provided in the U.S. It is interesting to note that although there are only 139 doctors for a population of one million, no free clinics exist at present on the islands.

Mrs. Mary A. Doehler, instructor of the Infirmary's esophageal voice classes, attended an Institute on Voice Pathology and the First International Meeting of Laryngectomized Persons, held in conjunction with the Institute. Mrs. Doehler, for several years a speech teacher for men and women who have had their larynxes removed because of cancer, was invited to participate in the special Institute and Meeting that took place on August 1 and 2 in Cleveland, Ohio.

The Meeting of Laryngectomized Persons provided an opportunity for an exchange of ideas in reference to the teaching of esophageal speech and recreational and vocational rehabilitation, while the Institute on Voice Pathology offered a professional meeting of medical and speech specialists in voice problems, plus a comprehensive survey of etiology and treatment of voice disorders.

Mrs. Doehler took part in a panel discussion on Methods of Teaching Esophageal Speech, part of the conference section on Rehabilitation of Laryngectomized Persons.

Brief bits: —

Dr. Henry K. Beecher, Chief of our Anesthesia Service, has been elected President of the New England Society of Anesthesiologists for the year 1952-53.

Dr. Mary A. B. Brazier, Neurophysiologist in our departments of Psychiatry, Anesthesia, and Neurology, was invited to lecture at the Maudsley Hospital of London University this summer.

Dr. Dorothy B. Chamberlin joined the Staff at McLean Hospital on July 1, as Assistant in Psychiatry.

Dr. Lewis M. Hurxthal (*W.M.* 1925) has been elected President of the Massachusetts Heart Association.

Dr. Philip Solomon, Assistant Psychiatrist on our Staff in 1937, writes: "We're leaving California and coming home!" His address will be 7 Gardner Road, Brookline 46, Mass.

Dr. Kurt H. Thoma went to Germany this summer as Civilian Consultant in Oral Surgery and Oral Pathology to the Surgeon General. He lectured and held conferences for the Service dentists in that area.

Dr. William H. Timberlake, Assistant in Neurology at M.G.H., announces the opening of his office for the practice of Neurology at 20 Gloucester Street, Boston.

Dr. David Weisberger, Oral Surgeon and Chief of Dental Service on our Staff, has been promoted from Associate Professor to Professor of Dental Medicine at the Harvard School of Dental Medicine.

There is a concession in the Breckinridge Park Zoo in San Antonio called the Reptile Garden, into which I wandered during my banishment to the Military Medical primary school at Fort Sam Houston. The Reptile Garden consists of a circular pit, about 20 feet in diameter and 3 feet deep, surrounded by a railing and an asphalt walk. By paying 25¢ to a beautiful blonde one may enter the area, lean on the fence, and peer at an assortment of creatures in the pit, including two half-grown alligators, an abundance of snakes of varied sizes, species, and degrees of decrepitude, and several frayed and scared frogs placed therein as food for the snakes. When the periphery of the pit became sufficiently populated with cash customers a weathered, lean man with leather boots under his long pants would enter the pit and stir up the snakes with a stick, giving a discourse on the habits, culture, and personal background of the various snakes he stirred. He would prod the racers until they raced; wallop, pound, and kick the rattlesnakes until they rattled; and feed the alligators a little hamburg. Occasionally one of the snakes would entrance the customers by eating a frog or another snake. Each Sunday there was a "rattlesnake fry", advertised in large lettering here and there, and occasionally in the daily paper. This affair consisted of cornering a large and ferocious rattlesnake, snaring him with a loop on the end of an old golf club, whacking off his head, skinning him as one removes a sock, chopping him into sections, frying him in deep fat left over from the previous Sunday, and serving him up on paper plates to the awed spectators who had paid the blonde 50¢ because it was Sunday and there was going to be a sacrifice. The meat was white and tender, tasting much like frogs' legs.

I thought this was grand, and engaged the weathered, lean man in conversation after the shouting had died down and most of the cash customers had departed – leaving their uneaten snake on their paper plates. He turned out to be a Cape Codder, and after exchanging pleasantries about the Bay State I learned that he bought snakes from local small boys and Mexicans for 50¢ a pound (75¢ apiece for coral snakes) and sold them to zoos or to anyone who wanted snakes. Indigo snakes, being very gentle and very large, had a special market with carnival snake-charmers. Most of the snakes eventually expired in the pit and they were salvaged. The skins were saved and sold – belts, shoes, etc. The fat of the rattlesnakes was placed in a large glass funnel in the sun where it gradually tried out and dripped into a bottle – rattlesnake oil, $1.00 per ounce, very good for rheumatism in Texas. The gallbladders were dried and sold for an unannounced price and mysterious purpose to a local Chinese apothecary. A desultory attempt had been made to extract venom, but apparently a fellow in Florida had a corner on the market and this was not considered worth while.

One thing led to another and thence to a bottle of beer, and finally I found myself in a trailer camp, eating supper with the weathered, lean man, his wife, the blonde (who turned out to be his daughter), and a smiling young Virginian who was his assistant. After this it seemed only natural to embark on a snake hunt, it being dark and there being sufficient Old Overholt in the pantry to support the mission in case of snake-bite. The latter, I found, was considered more prophylactic than therapeutic. This adventure proved to be the first in a series.

The function of these snake hunts was to provide water snakes and frogs to serve as fodder for the larger reptiles in the pit. The hunts were necessarily nocturnal because of the habits of the creatures, and were of course conducted in streams or swamps. Equipment consisted of a flashlight, a pair of boots, a pair of cotton work gloves, a golf club (#2 iron is best – a putter would be good, but the handle is too short), a gunny sack – and, of course, a bottle of Old Overholt.

It being late in the summer, the streams had become segmented into pools and the pools had dried to puddles, resulting in a concentration of the water fauna. In this particular ecological solution the frogs had a low solubility, being salted out by the snakes as the concentration increased; so a frog was a relative rarity and many pools seemed to be pure snake. The technique was as follows:

One would approach a pool, walking up the dry brook bed in the dark, don the cotton gloves, prop the bag mouth open with the crook of the left elbow, and, shining the flashlight boldly before one, wade hip-deep into the pool. Snakes could be seen swimming away in all directions to escape the invader. One had to grasp as many as one could, as quickly as possible, and stuff them into the bag. If one hesitated the snake would sound and hide in the murky water. The cotton gloves provided a sufficient thickness of cloth so that the little teeth of the water snakes could not penetrate to the skin of the hand, and his bite was ignored. Cottonmouth moccasins were in the minority among the brook snakes – but the approach to them was of course more formal and will be dealt with in the section on "Securing cottonmouths in Lake Mitchell". The cottonmouth is instantly recognizable and so "bear by the tail" situation did not occur. The benign water snakes have small oval heads and are intent on leaving town as rapidly as possible, while the cottonmouths have larger triangular heads with white markings about the jaws and are ready to mix it up, or at least stand pat. On our first venture we had a bag shortage, so the eager young hunter would enter a fruitful pool bagless, grab everything in sight and run for the man with the bag, looking a little like the Laocoön. In the course of an hour we filled an average-sized laundry bag about ½ full of snakes.

A later expedition in search of cottonmouth moccasins took us to the swampy shores of Lake Mitchell, just outside San Antonio. Lake Mitchell is fed by the outflow of the San Antonio sewers, so it is teeming with life and things. Vegetation grows rich and rank in its swamp and its waters fairly wiggle with wild life. Here the cottonmouth grows fat and happy – top-dog of a long series of creatures of increasing size, each feeding upon the smaller, its only obvious enemies being numerous nematodes and the collectors from the Reptile Garden.

The temperament and dentition of the cottonmouth necessitated a different hunting technique. This snake was almost always found at the edge of the water, and when approached he would not flee, but would coil and glitter his eyes, assuming a defensive attitude. Here the golf club came into play. Resisting a natural impulse to tee off, one would pin the coils of the snake with the head of the club, and work the club up the snake's body until the head was immobilized by pressure on the nape of the neck or thereabout. The snake thus being disarmed, one would grab him by the guzzle and drop him into the bag, first giving the bag a shake to cause its occupants to retreat to the cul-de-sac where they would not cause trouble.

There was one Army sergeant occasionally attending the hunt who had developed a somewhat different technique. First rendering himself immune to snake-bite with the medication provided for that purpose, he would approach a coiled cottonmouth and so bedevil it and terrify it with shrieks and proddings that it would betray its orthodox behavior and flee into the water. Then he would quickly grasp the very tail of the snake and carry it to the bag at arm's length. The snake was of course very interested in polishing off whatever was holding onto his tail and made efforts to arch its head up and bite the imprisoning hand. This was countered by shaking the snake straight again, as one would shake the coils out of a rope. Placing the snake in the bag was more difficult than in the conventional method, and resembled a little the game of croquet, using flamingos, as described in *Alice in Wonderland*.

The only significant snake-bite incurred during my acquaintance with this group was suffered by the smiling young Virginian. He accidentally put his foot into the mouth of a cottonmouth that was lying on the bottom of the lake digesting his evening meal. This would have resulted in nothing more than another snake in the sack but for the fact that he was wearing a pair of Japanese Army boots constructed of canvas and rubber, which did not prevent the entrance of one fang into his right little toe. First aid was applied on the spot in the form of a crucial incision with a razor blade through the puncture wound and a tourniquet about the ankle, and he was taken to the San Antonio Hospital where he spent a rather septic 3 to 4 weeks from the effects of cottonmouth bite and Lake Mitchell, or *vice versa*. Cottonmouth venom has a high titer of proteolytic enzyme and is also very dirty from a bacteriologic standpoint, so a considerable cellulitis is expected and clostridial infections are common. Our Virginian was loaded up with tetanus toxoid, antigas sera, antivenom, and antibiotics; the stocking of edema, representing progression of venom, etc. in the lymphatics, was periodically drained as it advanced with a circumferential garter of small crucial incisions through the skin and fat, and a venous tourniquet was kept above the edema. After a week or so the characteristic appearance of snake-bite was lost, and the leg looked like the leg of any one of the uncontrolled, unwashed diabetics with postphlebetic syndrome and badly infected athlete's foot which we see in E.W. The ultimate result, happily, was A4 F4.

As previously mentioned, most of the snakes expired in the reptile pit, and their life span in such captivity was usually measured in weeks. Post-mortem examinations on a few of these unfortunates demonstrated the reason for their demise, as each snake's viscera contained enough

MEMBERS OF THE MEDICAL HOUSE STAFF

variety and abundance of parasites to support a full-blown Ph.D. thesis. This is understandable when one considers that in nature the snake distributes its parasites' ova over a wide territory and probably seldom crosses its trail to reinfect itself; but in the pit the situation is much different, for not only did the snake wallow in its own and many other snakes' infected excreta, but the high snake diet they were on must have resulted in the diner accumulating the parasites of its meal plus the parasites of its meal's meal and its meal's meal's meal, etc. I was unable to help my friends in this problem in public health. The pit floor was already being hosed down daily, and my suggestion to diaper the snakes was considered neither helpful nor very funny.

I was asked to try my hand at treatment of one case, however, when A Florida Cottonmouth, whom we shall call George, suffered a decline. This snake was much larger than the local variety, measuring about 4 feet in length and being about as big around in the middle as a gym teacher's calf. For this reason, and because he had been imported at some expense, his impending loss was keenly felt.

When I first saw the patient he was lying listlessly on his side, with his mouth open and his lower jaw askew, looking very sad, indeed. History, as provided by the weathered, lean man, revealed that George had not been observed to eat anybody for about 2 weeks and had not stirred up well for about 6 days. Physical exam revealed a sick snake. I reasoned that George had the well-recognized clinical entity of too many worms, plus malnutrition. The indicated therapy was obvious: he should be wormed and fed. Searching about, I found some carbon tetrachloride in the Company fire extinguisher and some mag sulphate in a local bathroom medicine cabinet, and set about to accomplish the first part of the plan. An old Levin tube was found after a long search in the basement of the neighborhood drug store. George was weighed, and the CCl4 dosage scaled down accordingly. The Levin tube was passed in spite of poor cooperation from George, and the dose of CCl4 followed in a little while, with a good slug of 50% Epsom salt solution. The patient was then placed, expectantly, in isolation. The next morning George was surprisingly still alive, and the success of the treatment was evident. It looked as though George had whelped. We then proceeded with phase two, and squirted goodly amounts of raw egg and milk down George's gut. He responded wonderfully for the first 3 days, and resisted his Levin tube with real interest, like a regular South Winger. This improvement was only transient, unfortunately, and he went to Allen Street quite unexpectedly on the 6th day.

Post-mortem examination was performed. George's liver appeared not to have suffered from the CCl4. He appeared to have died from an obstructing lesion of the colon – in George, the descending colon. This looked for all the world like a carcinoma, but was probably an inflammatory process having to do with some kind of parasite. I put the specimen in my pants pocket, planning to have it sectioned in the pathology department of the Brooke Army Hospital. I would have loved to end this piece with a histological description, but, alas, my pants got sent to the laundry before I could accomplish my design.

Robert S. Shaw, M.D.,
Resident Surgeon

The 1950-51 season of art exhibitions in the Brick Corridor ended that June with a very special show – paintings and prints done by Boris Margo, well-known New York artist. His work aroused so much interest and appreciation that we have arranged with him to exhibit more of his work here next month.

Margo's paintings have been widely exhibited throughout the United States and in Paris, Brazil, Japan, and other countries. He is represented in the collections of the Museum of Modern Art, the Whitney Museum of American Art, the Metropolitan and Brooklyn Museums in New York, the Chicago Art Institute, the Philadelphia Museum, the National Museum, and many others. The Universities of Yale, Illinois, and North Carolina own examples of his work, as do also Lessing J. Rosenwald, Josepha Whitney, the Rockefellers, and several MGHers. Margo has conducted art seminars at the American University in Washington, D. C., in Boston, Louisville, Florida, and in other centers. He has invented his own printmaking technique — the cellocut – examples of which will be shown here. The Museum of Modern Art owns thirteen of these.

The Metropolitan Museum of Art has invited Margo to serve on the jury for its forthcoming exhibition of American watercolors, prints, and drawings.

We are indeed privileged to have eight or so examples of Margo's very latest work detoured via M.G.H. on their way from Provincetown to New York.

THE NEWS

No. 116 Boston, Mass. October 1952

THE ANESTHESIA LABORATORY

OF THE HARVARD MEDICAL SCHOOL AT THE MASSACHUSETTS GENERAL HOSPITAL

Doctors don't reason: they just rearrange their prejudices. So said (it is said) the late Mr. Vincent of the Rockefeller Foundation. There is no deterrent to the easy rearrangement of prejudices, as a substitute for reasoning, equal to a good laboratory. Over the past 16 years we have striven to build such a laboratory. In a report to THE NEWS a couple of years ago I wrote about the over-all Department of Anesthesia. This time I should like to describe the Anesthesia Laboratory in terms of what we are doing and where we are heading.

A NEGLECTED AREA IN MEDICINE

It seems fitting that research in anesthesia at the Massachusetts General Hospital should be an integral part of the institution, for, as though to celebrate the Hospital's silver jubilee, Morton's research with his fish, a dog, and one Gilbert Abbott, produced the Hospital's first great scientific contribution—a demonstration that is recognized over the world as a milestone of civilization's progress. Notwithstanding this auspicious introduction into clinical medicine, anesthesia remains a neglected area.

Some insight into the importance of this neglect can be obtained, perhaps, by taking a look at the results of a study we have been conducting in ten university hospitals. A careful on-the-spot examination of more than a half-million anesthesias over the past four and a half years indicates that the death rate from anesthesia (anesthesia deaths are so designated in each of the ten participating hospitals) is about 1:1650. Extrapolating this to cover all of the 7,000,000 anesthesias carried out in the 150,000,000 population of the United States each year, we find that nearly eight times as many citizens died of anesthesia as died last year from poliomyelitis. When one considers the millions rightly spent each year on poliomyelitis research and the small sum spent on anesthesia, the desperate need for giving attention to research in anesthesia is evident. It is believed that ours is the first laboratory to be dedicated to this end.

GOALS OF THE ANESTHESIA LABORATORY

Anesthesia in its death-dealing power is a neurological "disease". Even its sought-after primary effect is depression of the central nervous system; to an extraordinary extent its secondary or toxic effects strike through the nervous system. For example, even a complication apparently unrelated to the nervous system, like the accumulation of fixed acids in the blood as a consequence of ether anesthesia, can be prevented, as we have recently shown[1], by block of the nerve pathways to the adrenal glands. Even when these pathways are blocked, we can clinch the proof by injecting the secretion of the adrenal glands, epinephrine, in physiological amounts and show how this then results in the accumulation of fixed acids in the blood. The key to the understanding of the good and the bad powers of anesthetic agents lies in the nervous system.

There are two goals of the Anesthesia Laboratory: One is to study the problem of irritability (responsiveness) of the tissues to stimuli and the suppression of irritability by drugs—as fundamental a problem as exists in all biology; and second—a practical problem—to lower the death rate from anesthesia.

Let us consider the practical problem for the moment. How can the practical goal best be achieved? One point of view might be to go at once to a study of the complications of anesthesia: for instance, how often and why does spinal anesthesia cause severe headache, and why are some paralyses permanent after spinal anesthesia, as in the cauda equina syndrome? Now, such studies are needed and they are important; but to attack them is to attack the *symptoms* of the "disease", not the "disease" itself. In any case, funds are readily available from a number of sources for short-term studies of this kind.

In the long run, far greater distance will be covered and more of lasting value accomplished if a long-range attack can be made upon the basic problem stated in the first goal: Study of the primary effects of anesthesia, study of what the anesthesia process does, what anesthetic agents do to the nervous system in terms of *basic* pharmacology.

THE BROAD FIELD

Those not previously familiar with the work we are doing might wonder at the variety of the attacks being made on the problem at hand. The rationale of this several-phase attack becomes clear when it is realized that what can be studied profitably is the central nervous system depressants as a group. It is customary to divide these up into the sedatives, the hypnotics (the sleep producers), the analgesics[2] (the pain relievers), the antitussives (cough suppressers, related to the analgesics), the ego depressants (agents used in "truth serum", so-called), and the anesthetics. The needlessness of a rigid preservation of these several categories becomes apparent when it is realized that, for example, nothing more than increase in dosage of a barbiturate is adequate to take a patient through this gamut from sedative to anesthetic. A useful cross-fertilization of ideas comes from related work in these several categories.

SPECIFIC NEUROPHYSIOLOGICAL STUDIES

Under the following headings I shall describe how we have attacked this problem and how we hope to continue, handicapped as we are in planning and in holding the research teams together, by short-term grants.

A. *Techniques which make possible study of the white matter of the central nervous system.* In animals, Drs. Donald O. Rudin and George Eisenman[3] (since the work done is such a specific part of this presentation, I am including the titles of the papers with this text) have shown in this laboratory that various spinal cord tracts can be easily dissected over lengths of 10-15 cm and removed to a nerve chamber where they can study the character of the action potentials and metabolic peculiarities of central nervous system *white* tissue for as long as 24 hours. They have shown that these tissue masses are adequately oxygenated by diffusion alone and that spike potential properties are normal. In order to establish the fact of adequate oxygenation, studies were carried out which involved elevated tensions of oxygen. While the point was demonstrated with tensions slightly exceeding one atmosphere, deleterious effects of the oxygen were encountered at two atmospheres and studied extensively at eight. This led to a series of observations[4] which demonstrated that "oxygen poisoning" acts to increase the permeability of the cell membrane with loss of intracellular potassium and accumulation of it in the intercellular area. These techniques can now be applied to study of the effects of anesthetic agents on the cell membrane. This is very important. All evidence to date indicates that normal conduction of nerve impulses requires a normal membrane. The fundamental problem is how the anesthetic agents alter membrane properties and thus conduction of nerve impulses. Dr. Rudin and Dr. Eisenman are now in the process of characterizing the normal after-potential sequence of this tissue and find it strikingly different from that of peripheral nerve, notwithstanding many assumptions by others to the contrary. Associated with this difference there are some very interesting special responses of this tissue to altered ionic environment. This revolutionary new technique for studying the central nervous system has attracted the attention of several distinguished neurophysiologists who have come to see it. This technique makes available a new class of neural tissues (white matter) for electrical and pharmacological study of the effects of anesthetic agents on the central nervous system.

[4] Rudin, D. O., and Eisenman, G.: Effects of oxygen at high pressure on central nervous system axons, Federation Proc. *11*: 133, 1952.

B. *Study of the electrical activity of the central nervous system in sleep and in wakefulness and as influenced by anesthetic agents.* Dr. M. A. B. Brazier's work (Macmillan has recently published her book on *The electrical activity of the nervous system*) in this laboratory on the effects of barbiturates on the electrical activity of the brain, in particular her demonstration that with the onset of sleep the origin of the electrical activity shifts from the back of the head (the occipital region) to the frontal region[5], her new and as yet unpublished method of measuring depth of sleep, and the effect of hypnotic agents upon this, as well as the work[6] on motility during sleep and the effects of drugs on this, are all fundamental attacks upon basic problems of the primary effects of the central nervous system depressants.

C. *Work on the mechanism of block of pain.* Other work in this laboratory on animals[7] laid the basis for our current hypothesis that barbiturates in small dose can block pain in man[8] by block of internuncial neurones, producing a temporary, a reversible, pharmacological lobotomy. (The similarities of this to surgical lobotomy are striking.) This hypothesis[8] needs further study as a basic approach to an understanding of the mechanism whereby pain can be relieved. We have made the assumption that full perception of the experience of pain requires intact association paths (long circuiting, reverberating nerve impulses, intact internuncial neurones, to put it into neurophysiological terms). Techniques devised by Dr. John M. von Felsinger of this Laboratory provide a means for measuring in man the effects of drugs on association paths. It is our working hypothesis that the integrity of association paths which appears to be necessary for the functioning of memory and the perception of pain is related to phenomena recordable by the neurophysiologist (reverberating nerve impulses indicated by after discharge). A goal, even though distant, is to try to link, as just described above, recordable laboratory phenomena and sensations and thoughts. We know of no more promising approach than this one.

D. *Use of massive afferent stimuli in study of the mechanism of pain block.* This in turn has led to another attack on the pain problem: Our hypothesis is that massive afferent stimuli of whatever origin will block pain. This is being supported at present by studies in man in pain of pathological origin whereby a sudden flushing of the skin as the source of the massive afferent stimuli, produced by nicotinic acid, appears to be effective in relieving pain.

E. *The measurement of pain and a new method for quantifying the intensity of pain in man.* The method[9] used for measuring pain was evolved here. We[10] have recently devised a method for measuring the intensity of the pain of a group of individuals and the response of such groups to pain-relieving agents. The method, long needed, has been well received. For several years this work has been supported by the Committee on Drug Addiction and Narcotics of the National Research Council from funds contributed by a group of pharmaceutical manufacturers. Work closely related to the study of pain is the study of the antitussive agents supported by the Medical Research and Development Board of the Army and carried out by Dr. Robert A. Devloo.

F. *Measurement of subjective responses in general.* The work on pain, which goes back to the recent war[11] (more accurately, to the Cocoanut Grove disaster), was our first excursion into the field of measurement of subjective responses. These matters have been reported in several papers (see, for example, [11] and [12]) and have recently been summarized[13]. Relevance of these studies to the growth of psychiatry seems rather evident. In conjunction with the study of sedative agents we[12] have devised methods (recently with Dr. von Felsinger) for measuring the effects of hypnotic drugs on psycho-physiological efficiency, in particular the effects on the integrated functions of the cortex, such as judgment and association. We have shown[12] that for hours following ingestion of a single barbiturate sleeping pill, certain higher functions are impaired. We have been able to measure this impairment even more exactly in recent studies with Dr. von Felsinger. Dr. Louis C. Lasagna has recently come to the Laboratory from Dr. E. K. Marshall's department at Johns Hopkins. His interests include the narcoanalysis agents, the pain studies, and work with Dr. von Felsinger and me on the measurement of euphoria, in particular the effects of drugs on euphoria. When one considers how much misery is associated with illness both within the hospital and outside, it is curious how little attention has been devoted to study of the use of drugs to produce a sense of well-being.

Those not specifically familiar with these things might wonder what the study of pain has to do with anesthesia: Just as it is not profitable to study sleep without study of wakefulness, so also the study of anesthesia with the study of pain gives depth and fullness to the study of anesthesia and its basic mechanisms and problems.

METABOLIC EFFECTS OF ANESTHETIC AGENTS WITH EMPHASIS ON THOSE MEDIATED THROUGH THE NERVOUS SYSTEM

An essential for sound progress in understanding the effects of the central nervous system depressants is to know what derangements they produce in the metabolism. This phase of our work was made possible in the beginning by Mr. Edward Mallinckrodt. His generous continuing support has brought it to fruition. Work in the Anesthesia Laboratory would be poorly balanced without these studies. An important aspect of this problem that has had little study is the influence of the nervous system in mediating these metabolic effects. While, as indicated above, the Anesthesia Lab-

oratory is primarily concerned with basic problems, we are not unmindful of the many practical problems awaiting solution. Study and comparison of phenomena described above and below will unquestionably help us to understand how anesthesia kills so often, it will help in the choice of agents, and through better choice and better management of anesthesia will help to lower the appallingly high death rate from anesthesia.

In my estimation a part of the total problem that greatly needs study at the present time (and has the least support) is the influence of the nervous system on the metabolic effects of anesthesia. Our pilot work on this aspect of the problem has gone far enough to make it clear that a rich harvest is available there. Specifically, this work is as follows: Our attack upon the metabolic effects of anesthesia[14] has shown the importance of the role of the nervous system in producing these metabolic changes. (Dr. John P. Bunker and Dr. William R. Brewster have taken a leading part in this development, with the latter being primarily responsible for the work with total sympathetic block. Both Dr. Nils Normann and Dr. Brewster have been attacking the problem of the effect of the muscle relaxants on the nervous system and the resulting circulation changes. Dr. Donald P. Todd, with Dr. Linton's group, has been interested in studying the effects of ether on the sympathectomized extremity of man.) Ether anesthesia in the dog has been shown to result in a moderately severe *metabolic* acidosis, with rises of total fixed acids, lactic acid, and pyruvic acid in the blood. This acidosis is accompanied by a hyperglycemia and by a consistent fall in serum potassium levels. Although normal adult man does not show a significant rise in fixed acids during ether anesthesia, the infant and child develop a metabolic acidosis that is similar in all respects to that occurring in the dog, though somewhat less severe. These metabolic effects of ether anesthesia were duplicated by infusing into the dog with a total sympathetic block (see below) quantities of epinephrine that may be physiologically liberated from the adrenal medulla and sympathetic nerve endings during ether anesthesia. Ether anesthesia was administered to 17 dogs in which sympathetic block had been established and maintained by the intermittent injection of 0.4 percent procaine into the epidural space. In the dogs with a total sympathetic block, ether anesthesia at arterial levels of 95 mg percent failed to produce a metabolic acidosis and no significant changes in blood lactic acid, pyruvic acid, total fixed acids, blood sugar, or serum potassium were observed. It is concluded that the metabolic acidosis and hyperglycemia of ether anesthesia in the dog are directly related to the quantitative output of epinephrine occurring during ether anesthesia, with the resultant mobilization by epinephrine of liver glycogen as glucose and muscle glycogen as lactic acid. From the above work in the dog, we may infer that the presence of a metabolic acidosis in the child during ether anesthesia, as contrasted with the absence of a metabolic acidosis in the normal adult, is due primarily to a far greater relative output of epinephrine mediated through the nervous system in the child during ether anesthesia as contrasted with the adult, or the child is far more sensitive than the adult to epinephrine.

We propose to study further the epinephrine output of the adrenal glands as influenced by anesthetic agents. The experimental preparation[15] developed in this Laboratory (whereby "total sympathetic block" can be made, and in particular the nerve supply to the adrenal glands can be blocked or not as one wishes, through a catheter in the peridural space through which 0.4 percent procaine can be injected), opens up a new field for study of this gland.

We have obtained enough information to show that whether ether in the dog produces an accumulation of fixed acids, that is, a metabolic acidosis (unlike the situation in adult man but like that in infants and young children), depends on whether the nerves leading to the adrenal gland are blocked (see above).

We hope to continue to study the effect of the presence or absence of adrenal gland effects on acid-base equilibrium, on the electrolyte changes of the blood, and, at the same time, on the circulation as indicated by blood pressure, heart rate, cardiac output, and peripheral resistance (calculated response). We shall also want to inject epinephrine into the blood stream in physiological amounts when the sympathetic blocks are in effect, thus checking our conclusions. We have already done this for ether in the work referred to above.

We have done a good deal of pilot work with ether and a little with cyclopropane. We should like to make well-rounded studies of the effects of ether, cyclopropane, ethylene, barbiturate (thiopental sodium, "Pentothal"), and spinal anesthesia. Work is being carried on concurrently in animals, and in man wherever possible.

SIGNIFICANCE

Experimentation in animals has given rise in the past to very great discoveries; it will in the future. Without in the least minimizing the importance of animal experimentation now or in the future, it is fair to point out that there is rightly an increasing interest in human physiology and in human pharmacology. It is clear that the frog and the dog are less comparable to man than some have supposed. It is also clear in studying the effects of the central nervous system depressants that man is the "animal of necessity" for most of such work.

The work described in the preceding pages is opening up a new field by means of new techniques for the study of the effects of drugs on the nervous system, and on the mind of man. It is basic pharmacology, it is basic neurology, it is basic psychiatry, in the fundamental sense of those overworked terms. New questions have been asked; some have been answered; but only the surface of an area has been scratched which can have great importance in the development of medicine. It needs long-range planning. It needs long-range support.

Henry K. Beecher, M.D.,
Chief of Anesthesia Service

* * *

During a conversation the other day with Mr. Kinsman, our Superintendent of Works, concerning the new Nurses' Residence, which is fast going forward (or upward, we might better say), we learned that seven additional major construction jobs are under way or have recently been completed here at the Hospital. In case you may not know about all of them, here they are:

1. A 7th floor on the Vincent-Burnham Building has been started.
2. A one-story addition to the Vincent Laboratory, above the MGH Pharmacy, has been started.
3. The Mallinckrodt-Ward 4 has been remodeled – opening date was October 1.
4. Two constant-temperature rooms in the Research Building are nearing completion.
5. Studies have been completed and work started on the new Chemistry Laboratories on Domestic 3.
6. The Memorial Room for Dr. G. Marshall Crawford, on White 8, has been completed.
7. A new incinerator, in the old oil tanks behind the Bulfinch Building, is nearing completion. It will consume all the Hospital rubbish – 4½ tons a day.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Edwin B. Dunphy, Chief of Ophthalmology, and Dr. LeRoy A. Schall, Chief of Otolaryngology, took part in the thirty-eighth Clinical Congress of the American College of Surgeons, held in New York City from September 22 to 26.

Dr. Dunphy served as presiding officer for a symposium on "The surgical correction of motor anomalies involving the extraocular muscles". Dr. Schall was chairman for the symposium on "Nasopharyngeal fibromata".

Staff members will be leaving soon for Chicago to attend the meetings of the American Boards of Ophthalmology and Otolaryngology, which will be held from October 6 to 10. Subsequently, the American Academy of Ophthalmology and Otolaryngology will hold its meeting from October 12 to 17.

Dr. Dunphy, secretary of the Board of Ophthalmology, and Dr. Paul A. Chandler will serve on the ophthalmological examining board. Dr. Schall, as president of the Board of Otolaryngology, and Dr. Harris P. Mosher, Dr. Philip E. Meltzer, and Dr. Werner Mueller, members of the Board, will attend the otolaryngological examinations.

Several Infirmary doctors of both services will present instructional courses at the American Academy meetings, as they have done in past years. Dr. David G. Cogan will deliver the Jackson Memorial Lecture, speaking on "A type of congenital ocular motor apraxia presenting jerky head movements".

As is customary at Academy meetings, there will be a section of scientific exhibits. This year the American Association of Orthoptic Technicians will offer an exhibit entitled "What the ophthalmologist without an orthoptic technician can do for the orthoptic patient". Through visual means – charts, photographs, instruments – as well as through reports and case histories, the diagnosis and treatment of strabismus will be illustrated. Miss Ann Stromberg, Orthoptic Technician at the Infirmary, is co-chairman of the presentation, which is being planned in cooperation with the Department of Ophthalmology of the School of Medicine, Iowa University.

Dr. Trygve Gundersen, Surgeon in Ophthalmology, has been appointed Professor of Ophthalmology and head of that department at Boston University School of Medicine.

Dr. David S. Johnson, House Officer in the Department of Ophthalmology, has been appointed a First Lieutenant in the Air Corps. His first station was in Alabama.

The Board of Trustees, at their meetings on July 18 and August 15, voted:

To accept the resignation of Dr. John J. Cranley, Jr. from the position of Clinical Associate in Surgery, effective as of August 1.

To appoint:

Dr. George L. Brownell to the position of Associate Physicist (Medicine), retroactive to January 1, 1951 and to run through December 31, 1953;

Dr. Dulcie E. Blunden-Morris as Assistant Resident in Anesthesia, beginning September 1;

Dr. Nancy L. R. Bucher to the position of Associate Biologist (Medicine), effective July 1 and to run through June 30, 1955;

Lewis L. Engel, Ph.D. to the position of Associate Biochemist (Medicine), effective July 1 and to run through June 30, 1955;

Dr. Jerome Gross to the position of Associate Biologist (Medicine), retroactive to January 1, 1951 and to run through December 31, 1953;

Roger W. Jeanloz, D. Sc. to the position of Associate Biochemist (Medicine), retroactive to January 1, 1951 and to run through December 31, 1953;

G. David Novelli, Ph.D. to the position of Associate Biochemist (Research Chemistry), effective July 1 and to run through June 30, 1955;

Dr. Jesse F. Scott to the position of Associate Biophysicist (Medicine), effective July 1 and to run through June 30, 1955;

Dr. Elliot H. Sweetser as Clinical Associate in Psychiatry, beginning September 1;

Dr. James L. Vanderveen as Assistant Resident in Anesthesia, beginning August 15, 1953;

Dr. John M. von Felsinger to the position of Associate Psychologist (Anesthesia), effective July 1 and to run through June 30, 1955;

Dr. Byron H. Waksman to the position of Associate Bacteriologist (Neurology), effective July 1 and to run through June 30, 1955;

Dr. Oscar B. Williams, Jr. as Assistant Resident in Anesthesia, beginning October 1, 1953.

At their meeting on August 13, the General Executive Committee voted to continue the appointments of:

Dr. William H. Baker as Clinical and Research Fellow in Medicine, through June 30, 1953;

Dr. Joseph A. Blais as Clinical and Research Fellow in Medicine, through September 15;

Dr. Goodman Cohen as Clinical and Research Fellow in Medicine, assigned to Cardiology, through December 1, 1953;

Dr. Mandel E. Cohen as Clinical Fellow in Medicine, through June 30, 1953;

Dr. Philip H. Henneman as Clinical and Research Fellow in Medicine, through June 30, 1953;

Dr. Robert B. Loftfield as Research Fellow in Medicine, through June 30, 1953;

Dr. Raymond V. Randall as Clinical and Research Fellow in Medicine, assigned to Cardiology, through June 30, 1953;

Dr. Wilson R. Slaunwhite, Jr. as Clinical and Research Fellow in Medicine, through June 30, 1953;

Dr. Joseph E. Warren as Clinical Fellow in Medicine, through June 30, 1953;

Dr. Wesley G. Woll, Jr. as Clinical Fellow in Physical Medicine, through June 30, 1953.

To appoint:

Dr. Albert Damon as Clinical Assistant in Medicine for the period July 24 through August 31, to cover his services in the Staff Clinic;

Dr. Chester C. d'Autremont as Clinical Fellow in Psychiatry, to work under the direction of Dr. Jessner in Child Psychiatry, for the period September 1, 1952 through June 30, 1953;

Dr. Chester J. Dexter as Clinical Assistant in Surgery, assigned to the Tumor Clinic, effective as of July 1;

Dr. Allan St.J. Dixon as Clinical and Research Fellow in Medicine, effective as of August 25, 1952 through August 24, 1953;

Dr. James M. Doonan as Clinical Assistant in Surgery, assigned to the Tumor Clinic, effective as of July 1;

Dr. Jorge M. Martin as Clinical and Research Fellow in Medicine, to work with Dr. Stanbury in the Thyroid Clinic, effective as of September 9, for a period of one year;

Dr. Marc P. Moldawer as Clinical and Research Fellow in Medicine, to work under the direction of Dr. Fuller Albright, effective as of October 1.

The fourth Edward Pierson Richardson Lecture, in Clinical Science, was given in the Bigelow Amphitheatre on September 18. The speaker was Sir Cecil Wakeley, K.B.E., C.B., President of the Royal College of Surgeons of England. The subject of his address was "Hernia of the bladder".

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in some instances. It would save your editor considerable time and trouble if you would, *please*, remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration – an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Experimental pharmacology and measurement of the subjective response.
Science 116:157-162.
Brazier, M. A. B., and Beecher, H. K.
Alpha content of the electroencephalogram in relation to movements made in sleep, and effect of a sedative on this type of motility.
J. Appl. Physiol. 4:819-825.
Greene, N. M.
Hypotensive spinal anesthesia. (Foreword by Beecher, H. K.)
Surg., Gynec. & Obst. 95:331-335.

Biochemistry

Thomas, E. D., Hershey, F. B., Abbate, A. M., and Loofbourow, J. R
Chromatographic determination of nucleotides in the suspending medium from irradiated yeast.
J. Biol. Chem. 196:575-582.

General Surgery

Churchill, E. D.
Obliterative bronchitis and bronchiectasis. (The Alex Simpson-Smith Lecture. 1951)
London, Institute of Child Health, University of London, 23 pp., privately printed.

* * *

Ever since our Archives Department was opened in 1940, Mrs. Nathaniel W. Faxon has volunteered her time here at least one morning a week. The list of jobs she has done is a long one, but the particular piece of work she has been engaged in for the past several months merits special mention.

A year or so ago the framed pictures of groups of MGH doctors, dating back to 1839, were removed from the walls where they had been hanging for years in various places about the Hospital and were taken from their frames. To these were added many unframed pictures, including those of house staff members up to the present time. Mrs. Faxon has arranged these pictures chronologically in a large box specially built to hold them, and has set up a card index of the groups (under department headings) and of each individual in each group. To date, the file runs to over 1500 cards, with several index numbers appearing on many of the cards.

As an illustration of the value of her work – whenever a call comes for a picture of Dr. So-and-so, shown with his Hospital group in 1832 or 1952, or with his Harvard Medical School Class of 1830 or 1948, with one flip of a finger we can now locate that picture if it is in our collection. And the file proved its worth in another direction a short time ago. One of our doctors was searching for a picture he had seen which included only two members of our staff of several years ago. By simply looking at the cards for these two individuals and seeing that the same index number did not appear on both cards, we were able to say in less than a minute's time that the desired picture is not in our collection.

We have Mrs. Faxon to thank for this and many other jobs – jobs of great value to the Archives Department, but of such time-consuming proportions it would have been utterly impossible for your archivist to have done them.

* * *

The September meeting of the Distaff Club was held Friday evening, September fifth, in the Penthouse. Bobby Coe, Anne Ferguson, and Sally Kleaveland were hostesses on behalf of the Surgical Service.

Dr. Dean A. Clark gave a most interesting talk on many aspects of the M.G.H. – its history, its complex set-up, its finances, its educational functions, and its plans for the future. Several husbands were present and they contributed to a lively discussion of the plans for the proposed Massachusetts General Staff Associates. It was one of our most interesting and successful meetings, and we appreciate Dr. Clark's taking time from his busy schedule to speak to us.

On September eleventh, Mrs. Grant Rodkey, one of the founders and the second president of the Distaff Club, now a member of the Staff Doctors' Wives group, organized a very pleasant afternoon outing for the new members of the Distaff Club who are not working during the day. With the help of Mrs. Frank Wheelock and Mrs. Pierson Richardson (also Staff Doctors' Wives), Irma Levene, and Anne Ragland, Mrs. Rodkey looked after the children at her lovely new home in Belmont, while Dorothy Nielsen took a group of Distaffers out to Concord to see the two houses associated with Louisa May Alcott. There were delicious refreshments for both children and mothers, and everyone had a wonderful afternoon.

New addresses:—

Dr. Irving P. Ackerman (*M.* 1951), Mount Sinai Hospital, 5th Ave. and 100th St., New York, N. Y.
Dr. Ransom J. Arthur (*C.M.* 1952), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. L. Douglas Atherton (r.s. *U.* 1952), 706 Brown Bldg., Louisville, Ky.
Dr. Elizabeth F. Aub (*M.* 1952), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. Daniel W. Badal (r.p. *Psychiat.* 1942), University Hospitals, Cleveland 6, Ohio.
Dr. Benjamin A. Barnes (*W.S.* 1945), Memorial Hospital, 68th St. and York Ave., New York 21, N. Y.
Dr. Leon I. Charash (a.r.p. *C.M.* 1952), 87 Webster St., Irvington, N. J.
Dr. George Christman (*Dn.* 1951), 395 Commonwealth Ave., Boston, Mass.
Dr. Albert Damon (*M.* 1952), 11 Richmond Rd., Newton 58, Mass. (After Nov. 15, Constitution Laboratory, Columbia-Presbyterian Medical Center, 620 West 168th St., New York, N. Y.)
Dr. Frank R. Egloff (r.p. *Psychiat.* 1951), 1600th Medical Group, Westover Air Force Base, Chicopee, Mass.
Dr. Sheridan S. Evans (*E.S.* 1945), 701 South Broadway, McAllen, Tex.
Dr. Harry Chao-Hung Fang (a.r.p. *Psychiat.* 1952), Neurological Unit, City Hospital, Boston, Mass.
Lt. James J. Ferguson, Jr., MC, USNR (*M.* 1951), School of Aviation Medicine, U. S. Naval Air Station, Pensacola, Fla.
Dr. Knox H. Finley (*W.M.* 1934), 2675 Pacific Ave., San Francisco 15, Calif.
Dr. Buford Hall (*M.* 1946), University of Illinois Research Hospital, 1819 West Polk St., Chicago, Ill.
Dr. Hans J. Harder (a.r.p. *An.* 1952), Virchow Hospital, West Berlin N65, Germany.
Dr. W. Robert Harris (a.r.s. *Or.* 1952), 75 Forest Hill Road, Toronto, Canada.
Dr. Arvil J. Hinshaw (*E.S.* 1947), 714 Goodhue Bldg., Beaumont, Tex.
Capt. Louis F. Johnson, Jr., A.O. 757144, 6147 Tactical Control Group, APO 970, c/o Postmaster, San Francisco, Calif.
Dr. Daniel J. Joly (clin. & res. fel. *S.* 1951), Memorial Hospital, 444 East 68th St., New York 21, N. Y.
Dr. Byrl J. Kennedy (*M.* 1946), Department of Medicine, University Hospital, University of Minnesota Medical School, Minneapolis, Minn.
Dr. Brian Kiely (*M.* 1952), Johns Hopkins Hospital, Baltimore, Md.
Dr. George H. Lawrence (*W.S.* 1947), 650 North Woodlawn, Kirkwood, Mo.
Dr. Joseph E. Levinson (clin. & res. fel. *M.* 1952), Doctors' Bldg., Cincinnati 2, Ohio.
Dr. George W. Morse (*E.S.* 1910), Brooks Hospital, 227 Summit Ave., Brookline, Mass.
Dr. H. Eugene Patterson (a.r.p. *C.M.* 1952), 309 North 25th Ave., Yakima, Wash.
Dr. Ruth E. Reuting (clin. & res. fel. *M.* 1951), 413 West Elm St., Titusville, Pa.
Dr. J. Max Rukes (*M.* 1950), Barnes Hospital, St. Louis, Mo.
Dr. Paul R. Schloerb (res. fel. *S.* 1948), University of Kansas Medical Center, Kansas City 3, Kan.
Dr. Karl Schmid (a. biochem.), 64 Avon St., Brookline, Mass.
Capt. Robert E. Scully, MC, USAR (a. path.), FE, Yokohama, Japan, APO 500, c/o Postmaster, San Francisco, Calif.
Dr. Lloyd H. Smith, Jr. (*M.* 1949), A-24, Winthrop House, Harvard University, Cambridge, Mass.
Dr. Walter W. Theus (*Dn.* 1952), 1019 Pickens St., Columbia, S. C.
Dr. James H. Townsend (*W.M.* 1923), U. S. Veterans Administration Hospital, White River Junction, Vt.
Dr. Stanley C. Ulick (*C.M.* 1952), Memorial Hospital, 444 East 68th St., New York 21, N. Y.
Capt. Austin L. Vickery, Jr., MC, USAR (a. path.), FE, Yokohama, Japan, APO 500, c/o Postmaster, San Francisco, Calif.
Dr. Henry R. Viets (*Bd. of Cons.*), Longwood Towers, 20 Chapel St., Brookline 46, Mass.
Dr. Robert J. Vitt (a.r.s. *Or.* 1951), 105 West 13th St., Hays, Kan.
Dr. Leon E. White (cons. s. *Otolar.*), 395 Commonwealth Ave., Boston, Mass.
Major James G. Wood, Jr., MC, USAR (clin. fel. *R.* 1950), Station Hospital, Camp Pickett, Va.

Brief bits:–

Dr. Henry K. Beecher, Chief of our Anesthesia Service, gave four lectures, by invitation, in the Scandinavian countries last August.

Dr. Wilma J. Canada (a.r.p. *R.*) is at Oak Ridge, Tennessee, studying the use of radioisotopes in research. She is one of 32 research workers enrolled in a four-weeks' course conducted by the Special Training Division of the Oak Ridge Institute of Nuclear Studies.

Dr. Paul C. M. Zamecnik, Associate Physician on our Staff, returned to M.G.H. a few weeks ago from a six-months' leave of absence, during which time he has been working in Dr. Linus Pauling's laboratory at the California Institute of Technology,

Members of the Surgical House Staff

studying the relationship of structural chemistry to medical research problems. Dr. Pauling, a member of our Scientific Advisory Board, is one of the foremost theoretical chemists in the world.

Just the nicest kind of letter has come from Dr. John McL. Morris (*E.S.* 1941), from the Department of Obstetrics and Gynecology, Yale University School of Medicine, New Haven 4, Connecticut. It reads:

I am enclosing a subscription request, with the customary stipend, for the MGH News.

In one of the five or six baskets of things to be done which now cover my desk I found a letter from you requesting news of me for The News. Fortunately, this letter has no date on it but I suspect it was written some six months or a year ago. So many things have happened to me during the past eighteen months that I can give you news on practically any subject you wish, from radiation therapy in Sweden and travel in Europe to the art of having a baby and the real estate situation in southern Connecticut. Rather than involving you in running a set of serial articles, I might give you a brief and unembellished resumé, from which you may extract any pearls you so desire, and which, for the sake of perversity, will be in reverse chronologic order. Those who don't like this order can simply begin at the bottom and read backward.

To end with, my wife has had a baby. She says it is better than any baby that was ever born but to me it looks just like all the other babies in the nursery, except for its halo and wings. In this respect it takes after my wife. I suppose such things are hereditary.

Next to the last, I am now an employee of Yale University as Associate Professor, more or less in charge of the section of Gynecology. It was with very real regret that I left the Massachusetts General Hospital, but babies have to eat and wives have to have hats. We are buying a house in Woodbridge which I hope some of your readers will visit when they come to New Haven, which they do on certain week ends during the fall, if not at other times.

The fact that I am lazy by nature and dislike writing spares you from having to hear about the many facets of our trip to Europe. The primary object of the fellowship was to study radiotherapy as practised at the Radiumhemmet in Stockholm. The system of centralization of malignant diseases gives them a tremendous volume of material to work with – one that is considerably larger than in any institution in this country, amounting to somewhere between five and ten times the number of cases seen at the M.G.H. For example, for the year that I was in Stockholm there were more than 550 new cases of carcinoma of the uterus (cervix and corpus). Their cure rates are not only better than we are attaining here (49.3% five-year apparent cures of 311 cases of cancer of the cervix treated in 1945), but their incidence of complications from radium therapy was only a fraction of that reported by most of the institutions in this country.

The Swedish system of medicine is also an interesting one. In general, the Scandinavian countries have handled the problem of Government aid in medicine in a far more satisfactory way than the British. For example, Swedish medicine is semisocialized, with the Government subsidizing hospital beds and the teaching programs. The central municipal and university hospitals, with ward fees at about $1.00 a day, are staffed by salaried doctors who are permitted to accept, also, fees from private patients. In addition, the Government provides part of the income of about 500 doctors in districts too remote and too sparsely populated to support a doctor. Here, too, the doctors receive fees from the patients they see and in addition have private practices. The Norwegian system is somewhat different, amounting more or less to a compulsory health insurance. Whatever the theoretical advantages or disadvantages of these systems, they seem to work very well as I saw them.

In addition to our time in Sweden we managed to cover some 15,000 miles in our car, including England, Scotland, Wales, Norway, Denmark, Holland, Belgium, France, Germany, Switzerland, Italy, Austria, and Yugoslavia. Dr. Meigs is responsible for the last jaunt, which proved most interesting. Actually, all of it was interesting. It is fantastic and awful to see the efficiency of the destruction of German cities by the American and British air forces. Postwar apathy in France, Italy, and Britain, and the effectiveness of the crude Communist peace propaganda makes a sharp contrast with the fear of the Russian terror which exists in the countries bordering on the Iron Curtain. I am not sure that most Americans realize what the Iron Curtain really means and how young minds are being warped so that there are generations who know of nothing but of hatred for America and what America stands for. I think that most Americans who underrate this menace underrate it because they know very little about it.

Like all people who travel, I feel that it is good to be back again and settling down. I am afraid it will be a great blow to my wife, though, when she realizes that doctors have to stay up at night for other things besides balls at the castle at Uppsala or Paris night life.

My very best to everyone.

Capt. Austin L. Vickery, Jr., MC, USAR (a. path.) sends a brief amplification regarding his military address. He writes:

Capt. Robert E. Scully (a. path.) and I have been assigned on special orders to the Far Eastern Theatre's Central Laboratory for Pathology and Research, located in Tokyo. It should prove to be an interesting tour of duty.

We are very glad that Lt. James M. Davis, MC, USAR (*S.* 1948) is keeping us up to date on his whereabouts. A recent letter from him reads:

Thanks so very much for the July-August issue of The News. I read it with keen interest and am looking forward to future copies.

I am now at the Medical Field Service School, Fort Sam Houston, Texas, and expect to remain here through mid-August, at which time I anticipate being sent to the Far East Command.

Warren Bennett (*M.* 1948) and Don Rudin (res. fel. *An.* 1949-52) are in my group here.

I will write again after I get my permanent assignment. Meanwhile, my Florida address – 1819 Goodwin Street, Jacksonville – is the best bet, as someone will always be there to forward any mail.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 117 Boston, Mass. November 1952

THE TEAM CONCEPT IN NURSING

Nursing service administrators today are concerned primarily with one question, "How shall we take care of our patients?".

While many nursing leaders and educators are proclaiming a new era in nursing, those of us facing the day-by-day need to give good nursing care with limited resources are not so sure whether we are witnessing the emergence of a new era or are simply struggling in the decline of an old one. Professional status for nurses may evolve more naturally through the demonstration of changing attitudes on the part of nurses themselves than in any radical change in the pattern of nursing education.

We often hear it said that teamwork is not new in nursing. It is true that we have always worked together, but this has been the result of expediency rather than of intelligent planning. Actually, for seventy-five years we have practised independently within the framework of a hierarchy so designed as to inhibit any thoughtful divergence from the main stream. The increased number of patients with the decreased number of nursing service personnel have brought us up against the startling fact that we are losing face as a profession because we are failing to take care of our patients.

The team concept in nursing *is* new. But, as Goethe has said, "There is something inevitable about an idea whose time has struck". The word "team" itself has a reassuring connotation. It is symbolic of action and achievement. It comes to us from the Anglo-Saxon and originally meant "family"; later, "brood", as a brood of ducks; and finally "two horses harnessed to the same plow".

The team concept in nursing breaks down and forever dissipates the idea of line authority. A title becomes only a mark of identification, a symbol of the kind of contribution that person is making in the care of the patient. What a well-motivated and well-trained aide can do for the comfort of the patient is more important to the patient than what the director of nursing service can do. And yet both the aide and the director of nursing service have the same basic needs to satisfy in their daily living: security, approval, the sense of belonging, and all the rest. Under the old hierarchy the nurse had only a meager gratification for her labors. Her professional and emotional growth were stultified beneath a so-called "professional attitude". There was a constant projection of "All's well" when all was not well. With the team concept in nursing, the individual functions freely according to her ability, in an atmosphere which recognizes her personal worth and tends to promote her development.

The team plan method of assignment of patient care is based upon the team concept. It has as its objective the improvement of patient care. In attempting to attain that objective, we knew we had to do three things:

1. Relieve the pressure on the head nurse
2. Develop job satisfaction for the staff nurse and the auxiliary workers
3. Provide a better educational environment for the students

The team plan is simply a decentralization of authority. Instead of the head nurse having direct responsibility for patient care and supervision of her staff, she assigns these functions to staff nurses or student nurse interns. These delegates are called team leaders and they are responsible for a certain number of patients and for the workers (other graduates, professional students, licensed attendants, student attendant nurses, or aides) assigned to them by the head nurse.

In the Baker, where we have been working with the team plan for two years, we try to have a team in each wing (twelve beds) and, so far as is practicable and desirable, to keep the same teams in the same wings. It is not always possible to have a leader in each wing. We frequently have only two leaders available, in which case an appropriate division of the patients is made. We have had days when we have had only one leader. The remarkable thing is the fact that in spite of our limited staff no one has ever wanted to return to the old system.

The duties of a team leader are similar to those of a head nurse on a small ward, except that she has no "desk work". She plans the assignment of nursing care of the patients in her wing and helps her team members to carry it out. She assigns to herself patients she believes most needful of professional care, gives all medications (unless there are other nurses in her team), and does major treatments. If there are students in her team, she works closely with the clinical instructor in making assignments for them which are appropriate and of particular educational value. She tries to develop abilities in her team members, to accept and strengthen their weaknesses, and in general to give each worker a sense of belonging and of importance. This kind of responsibility, in turn, offers the staff nurse greater satisfaction than can be attained under the functional method.

The team members, under the close guidance of the team leader, develop a sense of solidarity as they learn to work together. They no longer think of patients as "my" patients. Rather, they have come to think of them as "our" patients. They feel secure in the accessibility of the leader. This is particularly true of student nurse (professional and practical) members.

And what about the head nurse? Perhaps the best evaluation of the team plan was made by a head nurse who was asked to relieve for a short time on a floor which did not have the team plan. She said she was so confused by the lack of organization that she wondered how she had ever functioned under the old system. Under the team plan the head nurse finds she has less work to do on her off-duty time, and this makes her more contented. She is able to leave the ward and go to the library or some quiet spot to write student reports, make out time schedules, and so forth, because she is secure in the fact that the team leaders can manage without her. She has more time to devote to the over-all planning of the ward, to the doctors, and to the patients. She has time to think about the after-care of patients and to suggest to the doctors where that care may be obtained. She can plan her clinical teaching more thoroughly. All of these things were, in fact, observed by consultants from the United States Public Health Service, who followed up their first study of head nurse functions at the M.G.H.* by a study of these functions eight months later on a floor using the team plan.**

As we watched the progress of the team plan we were soon aware that its success or failure was determined largely by the team leaders. From evaluation sheets distributed at intervals to all workers we were able to identify the good leaders. We found that the most successful ones were usually nurses who had been with us for some time. This suggested that familiarity with the environment was an important factor in leadership success. But we also found that enthusiasm for the plan was essential. When we started the team plan we simply assigned our staff nurses as team leaders and they learned their job by trial and error. We began to ask ourselves, "Is there a better way?"

In order to find the answer to that

question, we set up a one-year program to develop team leaders. We then advertised in the July and August 1951 *American Journal of Nursing* for participants. Our only requirement was that the applicants have a minimum of one year of staff nurse experience. Their hours during the first few weeks would vary, but when they were assigned to the wards they would work the regular 44-hour week — including classes, clinics, and so forth — that other nurses work. Their salaries would be the same as for other nurses with similar preparation and experience.

Early in October 1951 we started our first program with an enrollment of four nurses. One participant was from Massachusetts, one from Maine, one from Maryland, and one from Michigan. All of the participants had more than the minimum requirement, two of them had been supervisors. The program was directed toward establishing a feeling of security. They became acquainted early with persons they might otherwise not have known. They obtained a sense of belonging to a group of people — nurses and non-nurses — who were all working together to improve patient care.

To reinforce this sense of security, we included in our program those clinics and demonstrations which would give the participants accurate information about our ways of doing things and our equipment. They observed in the operating room and in the recovery room. They were given information about our student attendant nurse program and our aide program by the directors of those programs. They attended doctors' lectures given to refresher course students and to our professional students whenever possible throughout the year.

Three of these students completed the program and are still with us. They have become able leaders and have stimulated others to greater effort to improve the team plan. They are now helping with our second program, which began early in October.

At the suggestion of the first team leader students, the program has now been reduced to a six-months' period and nurses without experience are eligible. We have six nurses in this second group — one from Canada, two from Maine, one from Minnesota, one from Ohio, and one from Connecticut.

As more and more of our own students work with the team plan, both as team members and as team leaders, and as nurses from other places come here to learn about the plan, we begin to establish resources for putting the team concept in nursing into practice.

Many people ask what the effect of the team plan has been on our patient care. An answer to that question can be given only after someone determines how to evaluate nursing care from the standpoint of the patient. We believe the care has improved, but we have no statistics. Patients vary in their reactions to nursing care. Some are impressed by a nurse simply because she is pleasant and attractive, while a conscientious nurse, giving excellent care according to professional standards, may have a personality which has a negative effect upon patients. Patients also vary in their reactions according to their own philosophy of life: some expecting more attention than others. In general, if the small but important wants of patients are met promptly and cheerfully, the patient is usually content. That is why practical nurses and auxiliary workers can often be successful in nursing, in spite of their limited preparation. That is why the professional nurse is beginning to recognize her importance in assuring patients of good care which is also safe care.

Dorothy Perkins Newcomb, R.N.,
Assistant Director of Nursing Service, Baker Memorial

The traditional service pin ceremonies were held on Ether Day, October 16, in the Moseley Rotunda. The trustees of M.G.H. and Dr. Clark paid tribute to the more than 400 people present who had served the Hospital loyally through the years. For the first time, five-year service pins were awarded in addition to those customarily given for longer periods of service. Also for the first time, doctors who have been on the active staff of the Hospital for twenty-five consecutive years or more received service pins.

After Dr. Clark's opening words, Mr. Henry R. Guild, Treasurer of our Corporation and a member of our Board of Trustees, expressed the deep appreciation of the Board to these members of the MGH family for their long and devoted service to the Hospital. Dr. Clark's reference to our Director *Emeritus* elicited such a round of applause that Dr. Faxon, who was seated on the platform, was obliged to rise, and responded with a few extemporaneous words expressing his lasting affection for the Massachusetts General Hospital. An excellent piano program of five Chopin etudes was given by Mr. Alain Bernheim, an exchange student from the Paris Conservatoire to the New England Conservatory of Music. The awarding of service pins was then made by Dr. Clark.

After the ceremonies in the Moseley Rotunda, refreshments were served in the East Dining Room by the Dietary Department, assisted by twenty student nurses.

Dr. Nathan O. Kaplan of our Biochemical Research Laboratory from 1945 to 1948 has recently been honored by the Eli Lilly Award for Biochemistry for 1953.

Dr. Earl R. Stadtman of the same laboratory from September 1949 to June 1950 has received the Paul Lewis Award for Enzyme Chemistry for 1953.

* * *

The following communication has been received from Dr. Rulon W. Rawson (assoc. p. 1948) of the Memorial Center for Cancer and Allied Diseases, 444 East 68th Street, New York 21, N. Y.:

MEANS CLUB ORGANIZED

On May 8, 1952 twenty-two former fellows and associates of Dr. James Howard Means met at the Sloan-Kettering Institute to consider the organization of a Means Club.

At this meeting it was decided to organize the Means Club with membership limited, at least for the present, to former associates of Dr. Means who had worked with him in the Thyroid Clinic of the Massachusetts General Hospital. It was concluded that the purpose of the club would be to sponsor annual meetings, at which problems related to thyroid physiology and disease would be presented for informal discussions similar to those which we all had enjoyed with Dr. Means in the Thyroid Clinic.

The following resolutions were adopted: That the club should meet once a year in a clinic or laboratory of one of the members; that the annual meeting should be held in or near a center where one of the national medical or scientific meetings, which normally are attended by a majority of the group, is being held; that the time of each meeting should be for one day, either immediately prior to or after a national meeting.

It is planned that there shall be no formal organization of the club. A committee is composed of Dr. R. H. Williams of Seattle, Dr. J. Lerman of Boston, and Dr. R. W. Rawson of New York City.

It is planned that the group will meet on Sunday, May 31, 1953, at the Sloan-Kettering Institute, following the meetings of the Endocrine Society.

* * *

In response to the need for trained medical record librarians in hospitals all over the country, Simmons College and the Massachusetts General Hospital have inaugurated a joint training program. The first students to be enrolled were greeted at the Hospital on September 25 by Dr. Clark and Miss E. Louise Seymour, Record Librarian at M.G.H.

This is the only program in New England which provides a curriculum leading to a Bachelor of Science degree in this field. After three years of work at the Simmons College School of Business, the students in the fourth year divide their time between the College and the M.G.H. It was here at Massachusetts General, in 1917, under the leadership of Mrs. Grace W. Myers (then Treadwell Librarian and in charge of House Records, now Librarian *Emeritus*), that the first students ever to be trained as medical record librarians were enrolled on an apprenticeship basis.

All cases of patients at the Hospital

have been cross-indexed according to diagnosis as far back as 1873. Through the year 1950, the files contain the records of 660,000 patients, and our many medical research projects depend heavily upon information which can be gathered quickly in the Medical Records Department.

The Board of Trustees, at their meetings on September 5 and 19, and October 3, voted:

To accept the resignation of Dr. Harry W. Rudel from the position of Third Assistant Resident in Pathology;

To grant Dr. Joseph C. Aub leave of absence for the months of February and March 1953, in order that he may accept an invitation of the World Health Organization and the Unitarian Service Committee to teach in India;

To grant Dr. Joseph S. Barr leave of absence for the purpose of enabling him to be a member of a World Health Organization Team for Indonesia, for the period April 1 to July 1, 1953;

To grant Charles E. Rounds, D.M.D. leave of absence from his position as Assistant Dental Surgeon during his service with the U.S. Navy;

To continue Dr. William A. Rogers on the active staff of the Hospital through November 30, and to appoint him a member of the Board of Consultation as of December 1.

To appoint:

Dr. Marcel Berthiaume as Assistant Resident in Psychiatry, to begin January 1, 1953;

Dr. Samuel Bogoch as part-time Assistant Resident in Psychiatry at McLean Hospital, as of October 4;

Dr. Charles H. DuToit as Chief of the Chemistry Laboratory, as of September 1;

Dr. Freddy H. Frankel as Assistant Resident in Psychiatry for five months, beginning November 1;

Dr. William N. Jones as Assistant Resident in Orthopedic Surgery, beginning October 1, 1953;

Dr. Betsy A. Ledbetter as Assistant Resident in Anesthesia for one year, beginning July 1, 1953;

Dr. Farahe Maloof as Assistant in Medicine, effective November 1;

Dr. Chiu-chen Wang as Assistant Radiologist, as of January 1, 1953.

At their meetings during September and on October 1, the General Executive Committee voted:

To promote Dr. William P. J. Peete to the position of Resident in Surgery for one year, beginning January 1, 1953;

To promote Dr. Joseph B. Tanner to the position of Senior Orthopedic Resident for one year, beginning January 1, 1953;

To continue the appointment of Dr. Helen Thomopoulo as Clinical and Research Fellow in Medicine for another year, ending September 19, 1953.

To appoint:

Dr. Morris H. Adler as Clinical and Research Fellow in Psychiatry, beginning October 1;

Dr. Haroutioun A. Aprahamian as Graduate Student Assistant in Surgery for a period of six months, beginning September 2;

Billy Baggett, Ph.D. as Assistant in Biochemical Research, effective as of September 1;

Dr. Samuel P. Bessman as Research Fellow in Biochemistry, effective September 1;

Arnold F. Brodie, Ph.D. as Research Fellow in Biochemistry, effective as of September 1;

Dr. Louise S. Clark as Research Fellow in Medicine, effective as of September 10;

Dr. George H. Derry as Graduate Student Assistant in Surgery for one year, effective as of September 2;

Dr. John E. Gillespie as Graduate Student Assistant and Clinical Fellow in Surgery, assigned to Endoscopy, for one month, beginning September 1;

Sigmund Gruber, Ph.D. as Clinical and Research Fellow in Psychiatry, effective as of September 1;

Dr. Mahlon B. Hoagland as Research Fellow in Biochemistry, effective as of September 1;

Dr. William P. Jencks as Research Fellow in Biochemistry, effective as of July 1;

Dr. John H. Lamont as Clinical Fellow in Psychiatry, beginning September 1;

Dr. Ellen Lindback as Clinical Fellow in Anesthesia for a period of two and one-half months, beginning September 26;

Werner K. Maas, Ph.D. as Research Fellow in Biochemistry, effective September 1;

Dr. Patrick A. Ongley as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Athol G. Riddell as Clinical and Research Fellow in Surgery, effective as of October 1;

Dr. Roberto F. Santos as Clinical Fellow in Medicine, effective as of September 11 through November 30;

Dr. Albert Schilling as Clinical and Research Fellow in Medicine, effective as of September 1;

Ernst Simon, Ph.D. as Research Fellow in Biochemistry, effective September 1.

On June 30, Dr. Louis Dienes retired from the position of Bacteriologist. Effective as of July 1, he was granted the title of Consulting Bacteriologist.

On August 4, Mr. Edmund R. Mattos assumed the position of Assistant Director at the M.G.H.

* * *

VOLUNTEER GROUPS

Beginning with this issue, THE NEWS will carry reports and notices from the eight volunteer groups which serve either the Massachusetts General Hospital or the Massachusetts Eye and Ear Infirmary. These groups are:

1. The Ladies' Visiting Committee of the Massachusetts Eye and Ear Infirmary
2. The Board of Managers of the Vincent Memorial Hospital
3. The Ladies' Committee of the Bay State Medical Rehabilitation Clinic
4. The MGH Staff Wives Hospital Committee
5. The Distaff Club
6. The Ladies' Visiting Committee of the Massachusetts General Hospital
7. The Advisory Council to the School of Nursing of the Massachusetts General Hospital
8. The Massachusetts General Hospital Volunteer Service Department.

Since the Ladies' Visiting Committee of the Massachusetts General enjoys the distinction of being the oldest of these volunteer groups, we are including a brief account of its history and present activities and a statement concerning the formation of the new Coordinating Committee, as the leading report in this new volunteer groups column. This compendium is a transcription of a paper read by Mrs. Augustus Thorndike, Chairman of the Ladies' Visiting Committee of the Massachusetts General Hospital, at the 54th Annual Convention of the American Hospital Association, held in Philadelphia last September. The paper is titled "A Committee to visit the patient: the whys and wherefores", and reads:

In 1869 a committee appointed by the trustees of the Massachusetts General Hospital in Boston reported that they were in favor of appointing female visitors to the female wards *but* that the measure must be regarded as an experiment . . . that the Hospital is very well managed as it is . . . and it is unwise to disturb what is satisfactory . . . but that it may be found that with the help of *judicious* women it may be managed better . . . and that the benefits to be expected from lady visitors would, they thought, arise from their more acute perceptions.

Seven young ladies and four elder ladies were appointed, and just one year later were authorized by the trustees to visit the male wards, also, at their discretion.

Today there is a Visiting Committee of 50 active members who visit the wards in the General Hospital and, upon request, patients in the semi-private Baker Memorial. We have always been privileged to go into any part of the Hospital at any time of the day or night (perhaps because of the choice of "judicious women").

Each month visitors are assigned by the chairman of the Ward Visiting Committee to twelve wards in the General Hospital. Every member expects to visit for two months during the year, not necessarily consecutively, usually visiting her ward, or wards, twice a week. Any calls that come for special visiting are assigned by the chairman of the Ward Visiting Committee to one of the Committee who, she thinks, would be most helpful with that particular case. These special requests come from head nurses, social service workers, chaplains, members of the staff, and the trustees. Quite often they are for patients who are too far from home to have any visitors.

At the beginning of her visiting each member contacts the head nurse on her ward, who tells her which patients she feels are in need of a visitor. Frequently what a patient wants most is a listener – someone who, in a large hospital, has time to sit and listen. Walking along the corridor one day, a member was stopped by the head nurse on the ward where she had visited some months earlier who said, "How lucky to see you! Would you go up to the ward and see Elaine? She has just been told that the operation they were to do on her today has had to be put off, and what she needs most is to be able to talk to someone who has time to listen." Unfortunately, there is seldom time for the Hospital personnel to ease a troubled mind.

Periodically the question has come up as to whether the Massachusetts General Hospital should have a women's auxiliary. A committee appointed recently to consider this heard members of the various Hospital departments express their opinions on how an auxiliary could benefit the Hospital. We were very grateful to Mrs. Abraham E. Pinanski of the Beth Israel Women's Committee and Mrs. Frederick N. Blodgett of the New England Medical Center for discussing the organization and functions of hospital auxiliaries with us. Undoubtedly, every hospital has a somewhat different problem. The decision of this committee was that at the Massachusetts General, where there were already several voluntary groups serving the Hospital, instead of an auxiliary, it should recommend to the trustees that a Coordinating Committee be formed, consisting of the chairman and one other representative of each of these groups, thus leaving each individual group autonomous. Last autumn the first meeting of the new Coordinating Committee was attended by the two representatives from each of the volunteer groups. We have been both interested and benefited by the experience of the Presbyterian Hospital in New York with a committee very similar to ours.

The Ladies' Visiting Committee may still be an "experiment" and somewhat unique among women's hospital committees. We have never had a constitution or bylaws, we have never paid dues, and we have never been asked to raise money. However, we are custodians of six funds, three being willed to us and two given in memory of former members of the Ladies' Visiting Committee. The sixth, the X Fund, comes to us from an anonymous donor. We are simply trustees for this fund, turning the money over to the Hospital trustees to be spent for expensive medicines, like ACTH, etc. which so many patients are unable to pay for. Each year reports are sent to the donor, telling him of the specific cases his generosity has helped, and it is interesting that, never having had any previous association with the Hospital, he felt that giving money to the Ladies' Visiting Committee, rather than to a large community project, would assure its being used with a personal touch.

With the income from these funds, the net profits from our General Store, and contributions for special purposes, we are able to finance the expenses of the Ladies' Visiting Committee. The Committee has always been interested in pioneer projects in the Hospital, was responsible for starting our Memorial Gift Fund, and supported, wholly or in part, one of the first social workers, the first occupational therapist, and the first director of volunteers. These are now recognized parts of the Hospital organization. We have an Occupational Therapy Committee which recommends projects, financial or otherwise. At present we are paying the salary of a part-time musical therapist and an occupational therapist on the Children's Ward. The present director of volunteers is a member of the Ladies' Visiting Committee, and one of our Committee is a member of the Social Service Advisory Committee.

We now have many subcommittees, arising from "acute perceptions" while visiting and from personal contacts with the patients.

Cooperating with the Occupational Therapy Department, our Christmas Committee is responsible for Christmas activities throughout the Hospital. Planning for the patients' Christmas party, transportation of bed-, chair-, and walking-patients to and from the party, a children's party and the purchase of a gift for each child, purchase of poster paints for decorating the windows and glass partitions in the wards, Christmas cards for all ward patients and current Out-Patient Department patients, the addressing of the Christmas programs made in the Occupational Therapy Department, the purchase of greens and trees for inside and outside the Hospital, the financing of special Christmas projects, and the planning for groups of carolers and various other Christmas activities, are among the accomplishments of this committee.

We are often asked for furnishings for various parts of the Hospital, and on recommendation of our Furnishings Committee we sometimes finance such requests which the Hospital feels it cannot undertake.

Through our Library Committee we annually purchase for the Warren Library a number of new books and magazine subscriptions, both foreign and domestic, and playing cards to be distributed on the wards by the library book cart. A trustees' report of thirty years ago states: "The distribution of books to the patients by means of the small wheel trucks has been copied by many hospitals in other parts of the country."

The General Store is operated for the convenience of patients, their visitors, and the Hospital personnel, under the auspices of the Ladies' Visiting Committee. Our Store Committee is responsible for the paid personnel and the policies of the store, including a store cart to service the wards, manned by volunteers.

Our Plant and Flower Committee, besides providing flowers and plants for various parts of the Hospital, is sometimes asked to act in an advisory capacity in regard to outdoor planting.

In 1923 it was noted that a radio was donated to one of the wards instead of a Victrola. We now have a Radio and Television Committee who help with the problems connected with the purchase and servicing of these modern machines which give so much pleasure to the patients.

For many years the Ladies' Visiting Committee has helped with the teas given for the incoming class of student nurses and their families, and more recently has given teas for the visiting foreign doctors and their wives. During the spring and summer some of the Committee have had the student nurses and dietetic interns picnic at their country places. In the last few years several of the Committee, as well as many of the Staff Wives, have given their houses during the summer to some of the young doctors and their wives and children who otherwise would have had to remain in town, too often in very small and very hot apartments near the Hospital.

In January 1942, the Ladies' Visiting Committee organized a War Service of volunteers who did all manner of errands throughout the Hospital, including transportation of patients, and transmission of records, X-rays, and various requisitions. This has now become the Nursing Auxiliary Service, under the Nursing School Office, and staffed by paid personnel supplemented by volunteers.

Probably everyone remembers the Cocoanut Grove Disaster. Being familiar with the Hospital and with visiting the patients, members of our Visiting Committee were able to be of help that night and for many days after.

About ten years ago, through the vision and initiative of Bishop William Lawrence, Protestant Episcopal Bishop of Massachusetts, funds were collected for a Hospital Chapel. In 1941 a beautiful Chapel was built, in a location equally accessible to the General Hospital, Baker Memorial, and Phillips House. Over the door are the words: "Whoever will may enter here", and it was Bishop Lawrence's wish that the Chapel should be for the "spiritual refreshment of all, regardless of race or creed". Our Chapel Committee supervises the order and maintenance of the Chapel and keeps it supplied with flowers. During the winter of 1951-52 it was brought to the attention of the General Director that if there were no permanent religious symbol in the Chapel it would then truly fulfill the purpose for which it was built. The religious symbol which had been upon the altar was removed. Sickness and death are surely above sectarianism, and it is indeed gratifying that with the absence of any religious symbol in the Chapel men and women of varying creeds are now sitting or kneeling side by side. Now "The doors swing open for all", and "Whoever will may enter here". It is interesting that at this time there were ten Moslems in the Hospital as nurses, students, or doctors. The following quotation taken from the *New York Times* of September 12, 1952, speaking of the Meditation Room at the United Nations is also interesting: "Because of the variety of religions represented at the United Nations, care was taken to avoid any religious symbols."

For the past forty-five years this 83-year-old Visiting Committee has held monthly meetings, preceded by Executive Committee meetings, with the exception of the months of July and August. Reports of the chairmen of the subcommittees are given and a report of her visiting from each member who has visited during the month. At the annual meeting the Nominating Committee presents the slate for the election, for a one-year term, of chairman, vice-chairman, secretary, treasurer, and corresponding secretary. About three times a year we invite speakers, and for these meetings we also invite representatives of the Coordinating Committee and other committees connected with, or interested in, the Hospital. Once a year our chairman is asked to speak at meetings of the head nurses, student nurses, and dietetic interns. The lady member of the Hospital trustees is invited to all our meetings. The attendance at the monthly meetings, and not the speaker meetings only, has always been large, usually between seventy-five and eighty percent of our membership.

Our primary object is still visiting the patient. New members are told the importance of taking any problems or criticisms to the powers within and not to the world without. It is true that not everyone has the temperament or qualities necessary for visiting the sick. It can be both fascinating and rewarding. As one patient has written: "I have seen friendship offered to a girl who felt that she had no friends. I have seen her become interested in living again . . . because someone was concerned enough in making her feel like an important human being . . . most important of all, she was made to feel that someone cared", and in speaking of her own case this patient writes: "I had just had a straight-from-the-shoulder talk from one of the doctors and had been told some pretty dreadful things about my condition and prognosis. It was more than I could take and for the first time since I had contracted polio I went to pieces. I couldn't see any point in living – in being a burden to a young, ambitious husband, and a mother my child would be ashamed of because I would always be different from other mothers and an object of pity. While I was feeling the lowest a Visitor came in, and the tears I couldn't shed before my husband or mother were shed unashamedly before her. She talked very calmly to me and I knew she understood what I was going through. She didn't tell me I was lucky because I had my sight or my hearing or one good leg. She made no comparisons. I don't know exactly what she did say, but I know it was effective – for in about an hour I had stopped crying and was able to face my husband when he came. . . . The following morning she called the ward to find out how I was, and from then on her visits became a steady habit – even after her visiting period was over. The Visitor who followed her was equally wonderful."

[The high degree of interest in what our Ladies' Visiting Committee does for the Hospital was demonstrated at the conclusion of Mrs. Thorndike's talk by the number of requests, made by listeners from all over the United States and Canada, for copies of the Committee's booklet.—*Editor*]

MGH Staff Wives Hospital Committee

The fall meeting of the MGH Staff Wives Hospital Committee took place in the Walcott House living room on Wednesday morning, October 22. Coffee was served, after which Mrs. Walter Bauer and the chairmen of the various committees reported on the activities of the past year. Following the business meeting Dr. Robert L. Berg, Assistant Physician on our Staff, spoke on "Today's research – tomorrow's treatment".

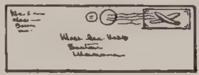
Ladies' Visiting Committee
Massachusetts General Hospital

The General Store is ready for Christmas. Are you? An early inspection of our cards and gift wrappings will assure you a fine selection and save you hours in crowded stores.

Several items have been added to our Archives collection since our last report of gifts. Among them are:

From Goodspeed's Book Shop — a printed program titled "Massachusetts General Hospital — Order of performances at King's Chapel, Thursday afternoon, 3d June, 1819", listing "full organ" voluntaries, Bible reading by the pastor, an address to the patrons of the Massachusetts General Hospital, and the words to "Hymn to benevolence". The watermark dates the paper on which the program was printed as being an 1806 product.

From Mrs. Grace W. Myers, Librarian Emeritus of Treadwell Library and of Medical Records at M.G.H. — Mrs. Myers's own copy of Dr. Ellis's *Extracts from a History of the Massachusetts General Hospital,* by Nathaniel I. Bowditch, with marginal notes made by Mrs. Myers.



Brief bits:—

Dr. Edward F. Bland, Physician on our Staff, was a guest speaker at the annual meeting of the Georgia Heart Association, held in Savannah on September 12 and 13. *En route* he visited the MGH contingent at the newly opened hospital of the University of North Carolina in Chapel Hill. The M.G.H. is represented there by Drs. Charles Burnett, Ernest Craige, Carl Gottschalk, and Isaac Taylor.

The following members of the Cardiac Group attended the meeting of the Fourth Inter-American Congress of Cardiology in Buenos Aires from August 31 to September 7: Drs. James H. Currens, Allan L. Friedlich, Howard B. Sprague, and Paul D. White.

Dr. Edward D. Churchill, Chief of our Surgical Services, was a guest of the Chicago Surgical Society on October 3. He delivered the 24th Annual Arthur Dean Bevan Lecture. His title was "Surgical interpretation of the biological processes of wound healing".

Dr. Robert C. Coe (*S.* 1951), will be on a six-months' affiliated service at the Snyder-Jones Clinic in Winfield, Kansas, from November until May.

Dr. Byrl J. Kennedy (*M.* 1946) is Assistant Professor in Medicine at the University of Minnesota Medical School and Director of Metabolism and Cancer Medicine.

MASSACHUSETTS EYE & EAR INFIRMARY

Mr. John Foster of Leeds, England, well-known ophthalmic surgeon, visited the Infirmary in September. He spent several days here, and presented a discussion on "The Ridley plastic lens" for the ophthalmological house officers and staff.

A special research project on the viruses of the upper respiratory tract was begun this summer in the Department of Otolaryngology. Investigation of the virus of influenza has been started and a program for the study of the common cold is being initiated. Robert Gohd, Ph.D., formerly in the Department of Bacteriology at Harvard Medical School, is carrying on this work.

Several new members have recently joined the staff of the Howe Laboratory. Jin Kinoshita, Ph.D. succeeds Dr. V. E. Kinsey as biochemist, and plans to study various metabolic processes in the eye in conjunction with Dr. Cogan. Dr. Kinoshita holds a joint appointment in the Howe Laboratory and the Biochemistry Department of the Harvard Medical School.

Toichiro Kuwabara, M.D. of Fukuoka, Japan, holds a one-year appointment in the Howe Laboratory, to study certain pathologic processes in the cornea. He is sponsored by the Boston Eye Bank.

Harold Kern, B.S. is associated with Dr. W. Morton Grant in research concerning the effects of chemical agents on the eye. Mr. Kern's appointment is sponsored by the Public Health Service.

Dr. Robert Herm began his residency in Ophthalmology on October 1. Dr. Herm is a graduate of Cornell Medical School and came to the Infirmary after two years of service with the United States Navy.

The ninth session of the Lancaster Courses in Ophthalmology was held at Westbrook Junior College in Portland, Maine, from June 21 to September 6. The courses, which were founded by the late Dr. Walter B. Lancaster, were sponsored by the Ophthalmological Study Council. Dr. Parker Heath, Director of the Eye Pathology Laboratory of the Infirmary, was the executive officer in charge of teaching arrangements.

Several Infirmary doctors served on the teaching staff. Dr. Harry E. Braconier taught Perimetry; Dr. Albert E. Sloane, Refraction; Dr. Paul A. Chandler, Glaucoma; Dr. W. Morton Grant, Toxicology; Dr. Merrill J. King, Medical Ophthalmology; Dr. Trygve Gundersen, External Diseases of the Eye; Dr. Edwin B. Dunphy, Surgical Principles; and Dr. Heath, Pathology. Assisting Dr. Heath were Dr. Donald Chickering and Dr. Robert H. Monahan, who served as fellows in pathology in the Eye Pathology Laboratory during 1950 and 1952, respectively.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in some instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration – an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Allergy

Burrage, W. S., and Irwin, J. W.
The treatment of bronchial asthma.
M. Clin. North America, Sept.: 1269-1278.

Evans, R. R., and Rackemann, F. M.
Allergy – Corticotropin and cortisone: A review of the literature from September 1950 to January 1952.
A.M.A. Arch. Int. Med. 90:96-127.

Rackemann, F. M.
The asthma problem.
Acta allergologica 5:1-10.

Biochemistry

Jeanloz, R. W.
La méthanolyse de l'acide hyaluronique méthylé.
Helvet. chim. acta 25:262.

Jeanloz, R. W.
The methyl ester of methylated hyaluronic acid.
J. Biol. Chem. 197:141-150.

Jeanloz, R. W.
3,4-dimethyl-D-glucosamine hydrochloride and derivatives.
J. Am. Chem. Soc. 74:4597-4599.

Dermatology

Lever, W. F., and Castleman, B.
Clear cell myo-epithelioma of the skin: Report of ten cases.
Am. J. Path. 28:691-699.

Lever, W. F., Hurley, N. A., and Blaney, A. E.
The proteins in pemphigus vulgaris. IV. Determination of the plasma proteins by electrophoresis and chemical fractionation in patients with pemphigus under treatment with ACTH or cortisone.
J. Invest. Dermat. 19:55-70.

General Medicine

Van Itallie, T. B., Waddell, W. R., Geyer, R. P., and Stare, F. J.
Clinical use of fat injected intravenously.
A.M.A. Arch. Int. Med. 89:353-357.

General Surgery

Churchill, E. D.
Management of wounds: Initial and reparative surgery.
In Symposium on treatment of trauma in the Armed Forces (10-12 March 1952), Washington, D.C., Army Medical Service Graduate School, Section Two, XI: pp. 1-5.

Neurology, Neurosurgery, and Psychiatry

Brewster, H. W.
Separation reaction in psychosomatic disease and neurosis.
Psychosom. Med. 14:154-160.

Farnsworth, D. L.
Medical progress: Mental-health aspects of civil defense.
New England J. Med. 247:209-216.

Lorenz, M., and Cobb, S.
Language behavior in manic patients.
A.M.A. Arch. Neurol. & Psychiat. 67:763-770.

Shands, H. C., and Finesinger, J. E.
A note on the significance of fatigue.
Psychosom. Med. 14:309-314.

Pediatrics

Wyngaarden, J. B., Crawford, J. D., Chamberlin, H. R., and Lever, W. F.
Idiopathic hypoproteinemia: Report of a case of transient edema, depression of plasma albumin and gamma globulin and eosinophilia.
Pediat. 9:729-735.

Physical Medicine

Watkins, A. L.
Physical Medicine in office treatment.
M. Clin. North America, Sept.: 1485-1493.

Miscellaneous

Farnsworth, D. L.
Doctors afield – Albert Schweitzer: Physician, philosopher, theologian, musician.
New England J. Med. 247:62-64.

Books

White, J. C., Smithwick, R. H., and Simeone, F.A.
The autonomic nervous system: Anatomy, physiology, and surgical application, 3rd edition.
New York, The Macmillan Company.

Dr. Evan Calkins, Chief Resident in Medicine—born in Newton, Massachusetts, 1920; attended Milton Academy; A.B., Harvard College, 1942; M.D., Harvard Medical School, 1945; Intern in Medicine, Johns Hopkins Hospital, 1945-46; U.S. Army: Medical Corps, biochemical research at the Army Chemical Center, Maryland, 1946-48; Assistant Resident in Medicine, Johns Hopkins Hospital, 1948-50; National Research Council Fellow in the Medical Sciences at Harvard Medical School, under Dr. A. Baird Hastings, 1951-52; practice of General Medicine, Peterborough, New Hampshire, summer of 1951.

Dr. Francis de Marneffe, Assistant Resident in Psychiatry—born in Brussels, Belgium, May 7, 1924; schools in Brussels, 1930-40; escaped to England via France at the time of the German invasion of Belgium, 1940; Bloxham School and King's College, University of London, 1940-42; Pilot in the Royal Air Force in England and Canada, 1943-46; resumed medical training, King's College and Westminster Hospital Medical School, University of London; L.R.C.P., M.R.C.S., M.B., B.S., 1950; Intern, Muhlenberg Hospital, Plainfield, N. J., 1950-51; Assistant Resident in Pediatrics, Kauikeolani Children's Hospital, Honolulu, Hawaii, 1951.

Dr. John H. Knowles, Assistant Resident in Medicine – born in Chicago, Illinois, May 23, 1926; Belmont Hill School, Belmont, Massachusetts; A.B., Harvard College, 1947; military service: ENS, USNR, 1947 to the present (2 years in ROTC); M.D., Washington University, St. Louis, Missouri, 1951; home address: 7025 Kingsbury Boulevard, St. Louis.

Dr. Si-Chun Ming, Assistant Resident in Pathology—born in Shanghai, China, November 10, 1922; M.D., National Central University Medical College, Nanking, China, 1947; Assistant Resident in Internal Medicine, University Hospital, Nanking, 1947-49; Medical Resident, Hackensack Hospital, Hackensack, N. J., 1950; Medical Resident, Christ Hospital, Jersey City, N. J., 1951.

Dr. George B. Murphy, Jr., Assistant Resident in Surgery – born in Plainview, Texas, 1926; U. S. Navy: Naval V-12 program, Hampden-Sydney College, Hampden-Sydney, Virginia, and University of Richmond, 1943-45; commissioned Ensign (H.P.), 1945; A.B., University of Virginia, 1946; M.D., Harvard Medical School, 1951; married.

Dr. Frederick G. Shaffer, Assistant Resident in Surgery – born in Nestorville, West Virginia, June 19, 1923; U. S. Army: Sergeant, serving in England, 1942-45; A.B., West Virginia University, 1947; M.D., Harvard Medical School, 1951; married.

Dr. Jack E. Tetirick, Assistant Resident in Surgery – born in Marysville, Ohio, September 14, 1926; military service: enlisted in U. S. Naval Air Corps, 1943, active duty as aviation cadet, 1944-45, discharged, June 1947; B.A., Ohio State University, Columbus, Ohio, 1948; M.D., Harvard Medical School, 1951; home address: 254 Amazon Place, Columbus, Ohio; married.

Dr. Giles D. Toll, Assistant Resident in Surgery – born in Denver, Colorado, January 16, 1927; A.B., Williams College, Williamstown, Massachusetts, 1947; M.D., Harvard Medical School, 1951.

Dr. Richard H. Watson, Assistant Resident on the Children's Medical Service – born in Lynn, Massachusetts, October 16, 1921; U. S. Army: Cavalry Medical Corps, and Infantry, with overseas duty in the 301st Infantry Regiment of the 3d Army in Germany and France, 1944-45; B.A., M.S. (Bacteriology), University of New Hampshire, 1947; Fellow, Department of Bacteriology and Parasitology, University of Rochester, Rochester, N. Y., 1949; M.D., University of Rochester, 1951.

New addresses:—

- Dr. Raymond A. Adams (r.p. *N.* 1951), University of Virginia Medical School, Richmond, Va.
- Simon Black, Ph.D. (res. fel. *Biochem.* 1952), Metabolic Institute, National Institutes of Health, Bethesda 14, Md.
- Dr. Thomas F. Broderick, Jr. (sr.r.s. *Or.* 1947), 1265 Beacon St., Brookline 46, Mass.
- Dr. Peter T. Brooks (*E.S.* 1943), 55 Tietan St., Walla Walla, Wash.
- Lt. Crawford S. Brown, MC, USNR (a.r.p. *D.*), U.S. Navy Dispensary, Constitution Ave., Washington, D. C.
- Dr. Chester J. Dexter (clin. a. *S.*), 51 Brattle St., Cambridge, Mass.
- Dr. Richard W. Dwight (*W.S.* 1931), Veterans Administration Hospital, Jamaica Plain, Mass.
- Lt. N. Joel Ehrenkranz, MC, USAR (*M.* 1950), Walter Reed Army Medical Center, Washington, D.C. (after Jan. 1, 1953).

Lt. John O. Esslinger, MC, USAR (sr.r.s. *Or.* 1952), U.S. Army Hospital, Box 48, Fort Bragg, N.C.
Dr. Albert J. Finck (a.r.p. *An.* 1949), 39 Somerset Rd., Brookline 46, Mass.
Dr. Amasa B. Ford (*M.* 1950), 2843 Hampton Rd., Cleveland, Ohio.
Lt. Boy Frame, MC, USAR (*M.* 1949), 8th Medical Group, 8th Fighter Bomber Wing, APO 970, c/o Postmaster, San Francisco, Calif.
Dr. Sanford T. Freedman (clin. a. *Or.* 1952), 316 Essex St., Lawrence, Mass.
Dr. David G. Freiman (a. path. 1950), Dept. of Pathology, Cincinnati General Hospital, Cincinnati 29, Ohio.
Dr. Lytt I. Gardner (*C.M.* 1944), Syracuse Memorial Hospital, Syracuse 10, N.Y.
Dr. Ferdinand Haase, Jr. (past a. dir.), R.D., Clipp Rd., Delmar, N.Y.
Dr. James P. Isaacs (a.r.p. *An.* 1952), School of Public Health, Harvard University, Cambridge, Mass.
Maj. Roy W. Leeper, MC, USAR (r.p. *D.* 1950), JAMMAT Dispensary, APO 206A, c/o Postmaster, New York, N.Y.
Dr. Francis M. McKeever (*Or.* 1930), Suite 804, 2010 Wilshire Blvd., Los Angeles 5, Calif.
Dr. D. Franklin Milam, Jr. (*S.* 1949), Surry, Maine.
Dr. Henry H. W. Miles (a. *Psychiat.* 1952), 1420 First St., New Orleans, La.
Lt. George B. Murphy, Jr., MC, USNR (a.r.s.), U.S. Naval Hospital, Chelsea, Mass.
Miss Edith E. Parris, American Journal of Clinical Pathology, Wayne County General Hospital, Eloise, Mich.
Dr. Raymond V. Randall (*M.* 1946), Mayo Clinic, Rochester, Minn.
Dr. Agustin L. Roque (res. fel. *Path.* 1952), Wheatstone Laboratory of Physics, Medical Research Council, Biophysical Unit, University of London, King's College, London, Eng.
Dr. Boris Senior (*C.M.* 1950), Medical Unit, University College Hospital Medical School, University St., London WC, Eng.
Wilson R. Slaunwhite, Jr., Ph.D. (clin. & res. fel. *M.* 1952), University of Utah, Salt Lake City, Utah.
Dr. Jack Spencer (r.p. *R.* 1934), 31 Deering St., Portland, Maine.
Lt. Giles D. Toll, MC, USNR (a.r.s.), U.S. Naval Hospital, Chelsea, Mass.
Dr. John C. Wilson (*Or.* 1917), Suite 804, 2010 Wilshire Blvd., Los Angeles 5, Calif.
Dr. John C. Wilson, Jr. (*W.S.* 1945), Suite 804, 2010 Wilshire Blvd., Los Angeles 5, Calif.

A long-overdue new address for Dr. Thomas L. Shipman (r.s. *P.H.* 1936) has just reached us, with this additional information:

My official position carries the title of Health Division Leader at the Los Alamos Scientific Laboratory. My office address is P.O. Box 1663, Los Alamos, New Mexico, and my home address is Route 1, Box 204, Santa Fe, New Mexico. I have been here since November 1948.

Dr. Joseph M. Stowell, who finished as Graduate Assistant in Surgery here in 1944, has written us an interesting letter. His present address is 1101 14th Avenue, Altoona, Pennsylvania.

Since last writing you of my activities I spent nearly a year in graduate work in general surgery at the Graduate Medical School of the University of Pennsylvania, from October 1950 to June 1951. The course was an excellent one and I highly recommend it to anyone, especially if he is practising away from a teaching center.

Following the termination of the course I returned to my general surgery practice in Altoona and have been quite busy since then.

On March 28, 1951, we had a red-haired addition to our family, making a total of five, to date. We are all getting along very comfortably and happily, although we miss our many friends in New England and hope the future may bring some leisure in which to renew old acquaintances.

I returned for the Alumni Day at the Pondville Hospital in June and had a grand time seeing many old Massachusetts General friends. I was very glad to join in the tribute given to Dr. Ernest M. Daland at the reunion and to become a member of the Daland Society. Dr. Daland certainly has done much for the Massachusetts General and Pondville, and for advancement in the treatment of cancer.

This letter has come from Lt. William N. Christenson, MC, USNR (*M.* 1949), whose present military address is USNS General A. M. Patch TAP 122, c/o Fleet Post Office, New York, N. Y.

Please list my address in the new MGH Directory as Box 524, Palm Beach, Florida, as this is a permanent home address for me.

I am still on active duty with the Navy, currently Senior Medical Officer on a transport in the Military Sea Transportation Service, Atlantic Area. This duty will continue until I leave the Service in January, to return to further house staff training in medicine.

Thank you for continuing my issues of THE NEWS.

In reply to our inquiry regarding his new address, Dr. Harrie R. Chamberlin (*C.M.* 1949) wrote:

Thank you for your note regarding the confusion over my change of address.

As of July 1 I became Chief Resident of the Medical OPD at the Boston Children's Hospital, and I presume this is the address you want for the new MGH Directory.

This appointment, however, is for six months, only, and I am not certain whether I shall subsequently enter practice or be doing academic work elsewhere. Hence, I would appreciate having THE NEWS sent to the address I previously gave you – 41 Middlesex Road, Chestnut Hill 67, Massachusetts – which is more permanent.

The many friends of Elizabeth Farrar, Librarian in our Warren Library from 1939 to 1947, will be interested to learn her new address. A short note from Miss Farrar reads:

After July 1, please send THE NEWS to me at the Public Library, Midland, Michigan. I enjoy reading it and so does my sister, who is an MGH graduate.

A letter has arrived from Lt. A. Thomas Licciardello, MC, USAR (*M.* 1948). His military address is APO 54, c/o Postmaster, San Francisco, and he writes:

I've just received the most recent issue of THE NEWS, which followed me halfway round the world before finally catching up with me here in Japan. I must say that I am very grateful for the perseverance of the Postal Service, and I spent an interesting hour reading through the familiar pages of our hospital paper. I noted with great pleasure the opening of the new House Staff Club rooms and regret that I was born five years too soon.

To fill in some of the gaps in my personal history for those who may be interested – I spent a full year at Fort Devens in pleasant professional and social surroundings. During this period our son Jere, now ten months old, was born. In March I came to the Far East, and have since been assigned to the 382d General Hospital, located just outside Osaka. I have no reasonable complaints about my duty here – working on the Medical Service, reading electrocardiograms, etc. – but I do long for the academic atmosphere now and then. Earlier this evening I attended the monthly meeting of our regional medical society, at which Frannie Moore – here on a one-month whirlwind tour as Consultant – gave an excellent talk on the treatment of shock, blood loss, and the renal complications of same. He was his usual masterful self and was the most intellectually refreshing thing to hit Japan since I've been here.

I would like to renew my subscription to THE NEWS, but find myself unable to transmit $2 via anything but military scrip. I will ask my wife to forward the amount. Please send THE NEWS to her at 20 Chase Street, Danvers, Massachusetts, since I expect to return within the next few months. My plans for the future are still uncertain, but from this distance all the alternatives look mighty good.

Best wishes to all the MGH family.

Dr. Mary S. (Blakely) Fisher (*M.* 1949) wrote this note on her subscription card:

After leaving Massachusetts General I began a radiology residency at the Presbyterian Hospital in New York. This was temporarily interrupted by the arrival of a son, now a year old. Am continuing in the X-ray Department at Garfield Hospital, Washington, D.C., and hope to complete my training early next year.

Two brief but very friendly notes have been received from Mr. A. L. d'Abreu, Visiting Surgeon at M.G.H. in 1951. Mr. d'Abreu's address is 58 Calthorpe Road, Edgbaston, Birmingham 15, England. He writes:

I get a great deal of pleasure from reading each issue of THE NEWS and have some idea of what is going on at the Massachusetts General Hospital from its contents. You all seem to be in as good heart as usual, and I am always interested to read of the many activities going on.

If any of your people are over in the Midlands of England I do hope they will let me know, as I should be delighted to see them. Dr. Churchill and Miss Sleeper, among others, could tell them exactly what they are in for if they do visit us!

It is just a year since Dr. Churchill was here with us, being just as delightful at the Queen Elizabeth Hospital as he is at the M.G.H., and I only wish we had him here again. However, I believe Dr. Walter Bauer will arrive soon.

I cannot tell you what a pleasure our contact with the M.G.H. gives to us all. You may say in any future copy of THE NEWS that if any M.G.H. man is within reach of the Queen Elizabeth Hospital, Birmingham, England, we shall always be delighted to see him.

My very best wishes to you all.

Dr. Means has sent us this letter he received from Lt. N. Joel Ehrenkranz, MC, USAR (*M.* 1950). The letter bears the address University of California, George Williams Hooper Foundation, Medical Center, San Francisco 22, and reads:

If the above address seems an unusual Army station, let me explain it by saying the Army has assigned me here to work under the aegis of Dr. Karl Meyer and continue the plague studies I started in Washington last fall.

At present we are involved in the pathogenesis and immunity of pneumonia plague in monkeys. I have a small "ward" (a monkey B 4) in which we do a fair number of clinical studies. Blood pressures, rectal temperatures, blood cultures, chest X-rays (I take and develop my own), laryngoscopies, Rumpel-Leede tests are all part of the routine— not to mention white counts and hematocrits. We are doing quantitative bacteriological studies to evaluate the efficacy of given immunizing agents. All in all, it is an excellent job, as well as I could do as civilian!

Dr. Meyer is a grand person to know. I have had close contact with him for the six weeks I have been here and find him a stimulating teacher — both in infectious diseases and in the art of living.

P.S. I did not get to Madagascar.

Mrs. Dorothy Perkins Newcomb, R.N.
Assistant Director of Nursing Service, Baker Memorial

A more recent letter from Dr. Ehrenkranz, written directly to The News, reads:

As I am still in the Army, a few words of clarification about my address are indicated. For the next few months I shall continue to function at the University of California, exploring some problems in the pathogenesis and immunology of pneumonic plague in monkeys. This is a delightful Army assignment, the uniform of the day being J. Press threadbare and the hours more or less my own. There are occasional tense moments in this pneumonic plague business, but armed with the clinical observation made in the E.W. by Dr. Stuart Ragland that I was too hard-bitten to die of anything but an acutely traumatic death, I regard the plague somewhat cavalierly. In regard to that fine physician and southern gentleman, he may be interested to know that not a few of the rhesus monkeys sprouted red carnations in their lapels on Robert E. Lee's birthday. One of these was overheard requesting his cagemate, a non-carnation-wearer, to keep his dirty cotton-picking hands to himself.

San Francisco is everything Dr. St. Goar said it would be – and more. My only regret, interns of the Army, will be in leaving this city; but by the first of the year I will probably be back at the Army Medical Center in Washington for my last few months (hopefully) of service.

Please extend my warmest regards to the personnel of the M.G.H.

We always know we are in for a treat when a letter arrives from Dr. Hugh Chaplin, Jr. (*M.* 1948). This one, true to form, arrived recently:

I'm afraid there has been a long lapse in correspondence on my part, due to the ever-present hope of prompt reassignment back in the U.S.A.; but since the Government seems likely to keep me here another six months, I am encouraged to send you a further news bulletin.

In these days of constant change, the Chaplins have been right on the band wagon. Within the last month our young daughter has returned from France, my wife has produced a 9 lb. male nuisance (David Dunbar, by name), and we have moved into a new flat (please note the new address – 4 Beverley Gate, West Hill, London SW 15). In spite of this personal whirlwind, the traditional atmosphere of calm which pervades the English landscape has remained unruffled, and we are sinking back again under its serene influence and digging in for another cold, damp winter.

In recent months the M.G.H. has seemed very close to us here in London. The first premonition of this phenomenon made itself felt in the presence of Gill Sanchez, who arrived with the Boston Symphony Orchestra under his motherly wing. We had a grand evening together, laying the groundwork with some good food and wine, followed by the exciting concert (there hasn't been as lively a concert in England for a millennium, I'm sure), and a few misty-eyed reminiscences over brandy before he headed back across the Atlantic. Not long after that, Linc and "Turtle" Clark turned up at our flat in Putney, and several nights later Bill Christensen blew in for a few brief hours, *en route* between Bremerhaven and Staten Island. We downed a few pints of "best bitter" at the Crossed Keyes pub in Chelsea, and then he, too, vanished into the night, as noisily as he had appeared!

Dr. Means's visit was a special pleasure, as you may well imagine. He was as enthusiastic and stimulating as ever, and after coming out to see the new laboratory building which my unit now inhabits, we adjourned to lunch in town with my boss and with Dr. Selwyn Taylor whom MGH-ers will remember because of his year with the Thyroid Group back around 1948. Other former visitors to the M.G.H. seem to be everywhere around one here in London – Ray Daley, who was with the Cardiac Group in 1950, also Tim Kunihan of the same outfit. And night before last, as I attended a Medical Research Society dinner at the London Hospital, I found myself sitting beside Paul Fourman of the Albright Group, 1948.

Quite in keeping with this reunion trend was the arrival of Dr. and Mrs. Chester Jones a few weeks ago – a most delightful interlude for me. Dr. Jones was much admired by all who met him out at the Hammersmith Hospital – his friendly ways, and his enthusiasm for the work which he was shown – these things made for him a host of new friends. He maintained his reputation as top-ranking authority in gastrointestinal affairs by insisting on a most excellent vintage Burgundy for the luncheon we enjoyed together.

It has been fascinating to be outside the U.S.A. during a presidential election campaign – to be able to see the reactions of the foreign press and to get first-hand accounts of British reaction to what they hear and read. There has been an interesting metamorphosis taking place in public opinion here, which I think can be summarized in three stages: 1) great relief at the defeat of Taft (who is much distrusted by Europeans) by Ike (whom all the Western Europeans revere); 2) astonishment and growing pleasure at the Democratic candidate, a man of whom Europeans knew next to nothing, but a man who seems to fit more closely than anyone else in recent decades into the Europeans' tradition of the statesman – polished, composed, witty, self-assured; 3) amazement and disappointment over the Nixon affair, not so much over the cause of the row as over the enormous emphasis which it received and over its sentimental denouement – these things are strictly outside the English political tradition, and they were very unfavorably received. I am forever besieged by the question "Who do you think will win?", but being so dependent upon the press for my information, I have not been able to make any sort of prediction. It is certainly tantalizing to be so far away at such a fascinating and important time.

My research progressses satisfactorily. We have passed the frontier in the field of blood preservation by freezing, but the "promised land" of practical application of the process is still some distance off. Nonetheless, with the goal in sight, though dimly, each day passes quickly and with some slight progress forward.

I expect to return to the U.S. in March. Till then, I renew our invitation to all MGH-ers near London – you will find a warm welcome at 4 Beverley Gate.

THE NEWS

Massachusetts General Hospital 1811

No. 118 Boston, Mass. December 1952

THE HOWE LABORATORY OF OPHTHALMOLOGY

The Howe Laboratory of Ophthalmology is unusual from several points of view. It is a department of the Harvard Medical School and is situated at the Massachusetts Eye and Ear Infirmary. It is devoted to the cause of ophthalmic research in the broad sense. Thus, it is as much concerned with ferreting out an enzyme system in the lens or measuring the rate of formation of the aqueous humor as it is with the clinical implications of neuro-ophthalmic disease or the selection of operative procedures for glaucoma patients. In fact, it is this integration of basic and clinical problems, or rather of basic scientists and clinicians, that has given the Howe Laboratory its unique opportunities and the reputation which it enjoys.

Founded in 1927 by a conjoint gift of Dr. Lucian Howe and the General Education Board of the Rockefeller Foundation, the Howe Laboratory got off to a start in a single room at the Harvard Medical School. The initial program had scarcely passed the organizational stage when it was halted by Dr. Howe's death. Operations were not then energetically pursued until 1932 when Dr. Frederick H. Verhoeff became the Director. Transferring the site of its chief activities to the Eye and Ear Infirmary, the Laboratory has since followed wherever opportunity has beckoned. Needless to say, the opportunities have been abundant, what with the vast clinical material at the Infirmary and the academic resources of the Harvard Medical School and other university centers. The fields of operation have been many. Dr. Verhoeff's many contributions during his eight years as Director were perhaps high-lighted by his fundamental studies in ocular pathology and psychophysiology of vision. Dr. Merrill J. King made extensive studies of infections and of tuberculoid reactions in and about the eye. Dr. Trygve Gundersen laid the basis for our understanding and treatment of virus infections of the eye. Dr. Clyde Keeler greatly enhanced the knowledge of ocular genetics. Dr. Elek Ludvigh was for years the pillar of physiologic optics. Dr. Everett Kinsey pioneered in ophthalmic biochemistry with great profit to all. Dr. Morton Grant has successfully straddled the fields of chemistry, pharmacology, and clinical ophthalmology. The present writer has enjoyed participation in many projects, especially those centering about clinical physiology of the eye. But as time deals out changes, so has it dealt with the Howe Laboratory. Drs. Ludvigh and Kinsey have left to assume professional positions elsewhere, setting up happily another, and basically similar, laboratory of ophthalmic research, and Drs. Jin Kinoshita and David Donaldson have joined the present staff. To this should be added, if space permitted, the names of research fellows and assistants who are serving or have served in the Howe Laboratory on numerous specific projects. The Laboratory has always been full to the capacity of its space and financial limitations. It is hoped it may grow in the future in size and service.

Current activities may be of newsworthy interest. Especially notable, perhaps, is the recent development of tonography in the Howe Laboratory. Heretofore, static measurements of ocular tension have been the chief means of determining the presence of glaucoma and the adequacy of control of the intraocular pressure. Dr. Grant, however, has perfected a technique whereby an increment of pressure is added to the eye while simultaneous pressure readings are made. Insofar as the increased pressure will cause an increased outflow of aqueous humor, the record obtained, or tonogram, gives an index of patency of the drainage canals in the angle of the anterior chamber. Now, by comparing tonograms of persons with normal eyes with those of glaucomatous eyes it has been possible to demonstrate that all glaucoma is due to obstruction of outflow. Moreover, by comparing the tonograms with gonioscopic or angle-viewing means it has been possible to demonstrate that the clinically different types of glaucoma are referable to the different types of angle obstruction. Finally, in conjunction with Dr. Paul A. Chandler, the tonogram is being used to predetermine the most effective therapy for the individual cases of glaucoma.

Another sphere of activity in the Howe Laboratory that may have general interest is that centering about effects of ionizing radiation on the eye. As a result of a survey undertaken for the Atomic Energy Commission, it was found that radiation-induced cataracts were occurring in a substantial proportion of those who had survived exposure to the atomic bomb in Hiroshima. This, combined with the fact that a number of physicists in this country were unexpectedly developing radiation-induced cataracts as a result of cyclotron exposure, has prompted a series of investigations in the Howe Laboratory aimed at studying the cataractogenic potentialities of the different types of radiation, and the mechanism by which cataracts are produced. It is probably fair to say that, as a result of these studies, the pathogenesis of cataracts is better understood for radiation cataracts than for any other type.

Of great popular interest has been the development, by Dr. Donaldson, of a superb technique for taking stereophotographs of the anterior segment of the eye. This has resulted in a collection of clinical photographs of the eye that, esthetically and pedagogically, are undoubtedly the best in the world. Moreover, a valuable series of stereophotographs have been made of selected brain dissections illustrating various phases of neuro-ophthalmology. This collection of eye and brain photographs provides a reservoir of pictures that have already proved of inestimable value in teaching, and should have increasing value for study purposes in the future.

But none of these current activities nor of the many others that might be pulled out of the hat represent fairly what the Howe Laboratory is or would like to be. There is no one problem, or even group of problems, to which the Howe Laboratory is resolutely dedicated. Rather, it is simply our humble aim to provide opportunity for persons of unusual talent and drive to devote their energies to the benefit of mankind through ophthalmic research. To paraphrase an old cliché dealing with pence and pounds, one might say, "Accumulate the intellects and the problems will take care of themselves."

David G. Cogan, M.D.,
Associate Surgeon in Ophthalmology
and *Director of the Howe Laboratory*

* * *

The Director of Admissions, Radcliffe College, has announced the offer of a competitive scholarship of $1000 in the Liberal Arts and Nursing Education for 1953-1954. The announcement reads:

"Radcliffe College and the Nursing School of the Massachusetts General Hospital offer this special scholarship on the basis of a competitive examination to be given in the applicants' schools in March 1953. Any senior interested in a career in nursing and in a liberal arts education is invited to try the examination. Additional scholarships are also available for this program leading to the A.B. degree and the diploma in nursing.

"A booklet describing the combined course and the scholarship examination may be obtained from the Director of Admissions, Radcliffe College, Cambridge 38, Massachusetts."

MASSACHUSETTS EYE & EAR INFIRMARY

The Board of Surgeons has accepted with regret the resignation of Dr. Lyman G. Richards, Surgeon for Bronchoscopy and Esophagoscopy.

Dr. Richards, an alumnus of the Infirmary, completed his residency in Otolaryngology in 1924. He was subsequently associated with the Children's Hospital and the Peter Bent Brigham, later becoming the Chief of the Nose and Throat Service at both hospitals. In 1940, Dr. Richards joined the staff of the Infirmary's Otolaryngological Department as our bronchoscopist and esophagoscopist, and received the appointment of Surgeon in Otolaryngology in 1943.

Dr. Richards is the author of *Otolaryngology in general practice.* He is a past president of the American Triological Society (1948) and the American Broncho-Esophagological Association (1939).

Dr. Richards will continue his association with the Infirmary as a consulting surgeon.

Dr. Charles L. Schepens delivered the Mark Schoenberg Lecture on December 1 before the New York Academy of Medicine, in New York City. "Prognosis and treatment of retinal detachment" was Dr. Schepens's subject.

Members of the Departments of Otolaryngology and Ophthalmology took part in a Medico-Military Symposium for Military and Civilian Physicians and Allied Professions, held at the United States Naval Hospital in Chelsea, from October 27 to 29. Dr. Richards spoke on "Epistaxis", giving a presentation of a case; and Dr. Daniel Miller discussed "Ear, nose, and throat cancer". Dr. W. Morton Grant presented a lecture on "The diagnosis of glaucoma".

Dr. John J. Shea returned to the Infirmary in October to complete his residency in the Otolaryngological Department after two years of absence for military duty. Dr. Shea began his residency in 1949, and entered the armed services in 1950. His principal military station was the U. S. Naval Hospital, Bainbridge, Maryland.

The Board of Trustees, at their meetings on October 17 and 31, voted:

That, in order to stimulate interest in the March 1953 class of the Training School of Nursing, five tuition scholarships of $300 each for the three-year course be instituted for students entering next March;

To change Dr. Warren B. Weil's title from Clinical Fellow to Assistant Resident in Pathology.

To appoint:

Dr. Stanley Berlow as Chief Resident on the Children's Medical Service for one year, beginning July 1, 1953;

Mr. Leon O. Brenner as Assistant Psychologist, effective September 29;

Dr. Hugh R. Dudley, Jr. as Third Assistant Resident in Pathology for one year, beginning July 1, 1953;

Dr. Morten Grove-Rasmussen as Director of the Blood Bank, effective November 1;

Dr. H. Walter Jones, Jr. as Assistant in Medicine;

Dr. Remedios K. Rosales as Assistant Resident in Pathology for one year, beginning July 1, 1953;

Dr. Jerome L. Weinberger as Clinical Associate in Psychiatry.

At their meetings held on September 24, October 15, 23, and 29, the General Executive Committee voted to appoint:

Dr. Luis I. Arias as Clinical Fellow in Medicine, assigned to Cardiology, effective as of October 1;

Dr. Samir Bashour as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Alice N. Bessman as Research Fellow in the Children's Medical Service, effective as of September 1;

Dr. Rodolfo Carriedo as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Enrique E. Valenzuela as Graduate Student Assistant in Surgery for one year, beginning September 24;

Dr. Filiz Gencer as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Ghislaine Gilbert as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Manuel Guzman as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Thomas C. Hall as Clinical and Research Fellow in Medicine, effective as of July 1, 1951;

Dr. Paul P. Harasimowicz as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. William P. U. Jackson as Research Fellow in Medicine, effective as of December 1;

Dr. Klaus A. J. Jarvinen as Graduate Student Assistant in Medicine, for the period of October 15, 1952 through January 15, 1953;

Dr. Howard Levine as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Henry M. Lloyd as Research Fellow in Medicine, effective as of November 1;

Dr. Raul de la V. Lopez as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Mary N. McGovern, Ph.D. as Research Fellow in Medicine, effective as of October 16;

Dr. Myron H. Matz as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Seiichi Ohmori as Graduate Student Assistant in Dermatology, for the period of October 1 through December 31;

Dr. Raphael O. Patt as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Porn Piskanok as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Firmin E. Vansteenhuyse as Research Fellow in Medicine, for the period of four months ending January 31, 1953;

Dr. Wade Woothipoom as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. William Zukel as Graduate Student Assistant in Medicine, assigned to Cardiology for one year, beginning October 1.

* * *

Plans are in the making for the week-long Christmas festivities at the Hospital, and the Nurses' Christmas Formal is already scheduled for December 12. The program for the week immediately preceding the holiday will include the usual carol singing throughout the Hospital, the Nurses' Candlelight Service, the party for adult patients in the Moseley Rotunda on December 22, the children's party in the Burnham wards, the MGH employees' family party on December 23—for their children at 7 and the adults' dance at 8.

Further details concerning plans for Christmas at Massachusetts General and the Eye and Ear Infirmary are given in the "Volunteer Groups" column in this issue.

The following report concerning Dr. Marius N. Smith-Petersen, a member of our Board of Consultation, appeared in the July 5 issue of the *British Medical Journal.* Dr. Otto E. Aufranc, Assistant Orthopedic Surgeon on our Staff, very kindly sent us a reprint of the report and the *British Medical Journal* has given us permission to use it in THE NEWS. The article, titled "Reports of Societies", with subtitle "Dr. Smith-Petersen at Royal Society of Medicine", reads:

> At a crowded meeting of the Orthopaedic Section of the Royal Society of Medicine on June 25 Dr. M. N. Smith-Petersen, of Boston, read a paper entitled "Lessons learned from 14 years' experience with mould arthroplasty of the hip-joint."
>
> Dr. Smith-Petersen recalled that the purpose of an arthroplasty was to relieve pain and restore the greatest possible function to the joint. It was not possible to restore normal function, and the result necessarily varied with the quality of the "working stock", as he termed the tissues involved in the reconstruction. The principles of his method of mould arthroplasty were to reshape the joint surfaces to form a joint as mechanically perfect as possible, and to "guide" repair by the insertion of a smooth-surfaced mould of inert metal between the moving parts. The mould was designed to move freely within the mould. That the principle of guiding repair by a mould was sound was proved by histological studies of material removed at later operations or at necropsy. The articulating surfaces were found to be covered by smooth fibro-cartilage and sometimes even by hyaline articular cartilage. The stimulus to the formation of this smooth cartilage on the surface of the bone was a combination of pressure with friction against the smooth hard surface of the mould.
>
> ### OPERATIVE TECHNIQUE
>
> Discussing the technique of operation, Dr. Smith-Petersen said that he favoured the anterior incision, reflecting the abductor muscles from the ilium and turning the rectus femoris downwards. He preferred to isolate the lateral femoral cutaneous nerve and to divide it deliberately to prevent the possibility of pain from involvement of the nerve or its branches in the suture line. He still believed that it was wise to resect the synovial membrane as completely as possible. Its removal was equivalent to a neurectomy and he was satisfied that it reduced post-operative pain, even though the membrane always regenerated. He emphasized the importance of reshaping the acetabulum as well as the head of the femur. There was a tendency to leave the acetabulum alone if its cavity appeared reasonably smooth; but the temptation to do so should be resisted, for without careful reshaping of the acetabulum the new joint was mechanically unsound. He believed that neglect of this important step was

a cause of indifferent results. In most cases it was of advantage to deepen the acetabulum, and one should not hesitate to deepen it to the extent of penetrating the wall of the pelvis if that was necessary to secure a sound mechanical joint. It was his practice to cauterize raw bone at the rim of the acetabulum and on the ilium because, although there was no scientific proof of it, he believed that new bone formation was thereby reduced.

"Revisions", or secondary operations, might be necessary to improve the hip further, especially when the quality of the working stock at the time of the primary operation was poor – as in rheumatoid arthritis and ankylosing spondylitis. Because further operations might be needed he believed firmly that as little of the head of the femur as possible should be removed. To this end degenerative cavities in the femoral head had often been packed with bone chips to avoid sacrificing too much bone.

Referring to his results, Dr. Smith-Petersen reported a total of 1,039 arthroplasties, including 197 "revisions." There had been only one operative death. Wound infection had occurred in 42 cases. Improved methods of anaesthesia, transfusion during operation, and antibiotics had helped to make the operation safe even for old patients.

TRIBUTES TO DR. SMITH-PETERSEN

Before reading his paper Dr. Smith-Petersen was presented with the diploma of Honorary Fellowship of the Royal Society of Medicine by the president of the Society, Lord Webb-Johnson. Making the presentation, Lord Webb-Johnson said that a great debt of gratitude was due to Dr. Smith-Petersen for his pioneer work, which had brought relief of pain to thousands.

At the conclusion of the meeting Mr. H. J. Seddon also paid a warm tribute to Dr. Smith-Petersen. He had been endowed, he said, with a mechanical genius which he had used to full advantage. He recalled the many contributions that Dr. Smith-Petersen had made to orthopaedic surgery. They included the nailing of fractures of the neck of the femur, his exposure of the sacro-iliac joint for arthrodesis, his exposure of the hip-joint, his method of arthrodesis of the wrist, his mould arthroplasty of the hip, and recently, his bold operation of osteotomy of the spine for fixed flexion deformity.

* * *

RESEARCH ACTIVITIES OF THE ALLERGY DEPARTMENT

In October 1947, Dr. Francis M. Rackemann wrote in THE NEWS of the Allergy Clinic, of its beginnings in 1919 as one of the first out-patient ventures of the kind in this country, and of its progress from the earliest days to the post World War II period. This account, covering over a quarter century, embraced a period in medicine during which clinical investigation in the field of hypersensitivity made solid advances both in the United States and abroad. A subsequent report in THE NEWS of February 1952 by Dr. Burrage recounted more recent progress.

The Allergy Laboratory also came into existence in 1919 and was housed on the fourth floor of the Bulfinch Building until 1942 when it was moved to the basement. In 1950, it again migrated, this time to its present situation on the fifth floor of the Domestic Building. From 1919 to 1950, this laboratory was largely concerned with the preparation of antigenic extracts and vaccines used in the testing and treatment of allergic individuals. At all times, however, some clinical or more basic problem, such as the place of histamine in the antigen-antibody reaction, was under consideration.

By 1948, it had become evident that more fundamental research was greatly needed in the field of allergy. Allergic reactions tend to be explosive in nature. It appeared logical that one or more of the three great integrating systems of the body—neural, hormonal, or circulatory—might well be involved in these reactions. The study of the circulatory system was decided upon mainly because there was already some evidence that changes in the small vessels—arterioles, venules, and capillaries—were important in anaphylaxis and secondly because this system may be studied from the anatomical, physiological, and chemical standpoints.

This decision committed the Allergy Laboratory to a long-time, expensive basic project. Several problems had to be faced.

1. Continuation of routine laboratory procedures

The manufacture of essential extracts and vaccines was first studied. The latest and most efficient methods were introduced and all equipment put in good order.

2. Personnel

As microscopic study of living blood vessels had been determined upon as a research project, Dr. John W. Irwin —at the suggestion of Dr. Cecil K. Drinker—was sent to study with Dr. Melvin Knisley in South Carolina from 1949 to 1950. Miss Priscilla Gordon joined the laboratory staff in October 1951, and in February 1952, Miss Mary Graham left for a year at the Rigshospital in Copenhagen where she is now in the process of learning methods in use by Dr. Hausen and Dr. Warburg for making certain vascular pressure measurements. Miss Ina Gram Petersen, with similar experience in Copenhagen, came to us in exchange. Each year two medical students have been employed to help with the work throughout the summer.

3. Space

As the scope of the experiments grew, the space problem became acute and, in the absence of available expansion facilities, has remained so. During the summer of 1952, the laboratory ran from 7 A.M. to 2 A.M. daily, with different workers operating in shifts.

4. Financial support

The problem of sufficient funds is always with us, but a two-year grant from the U.S. Public Health Service and generous donations from friends of the Allergy Department have enabled the work to continue.

Microscopic studies of small blood vessels go back to Malpighi[1] in 1687. In 1922, Augustus Krogh[2] wrote: "The capillaries constitute the most essential part of the whole circulatory system. It is a little strange, therefore, to find that they have been neglected in an extraordinary degree." While much work has been done in the past thirty years on capillaries, this statement is still true.

It was first necessary to study the circulatory patterns of the minute vessels of internal organs of living mammals. The liver and subsequently the lung of both the guinea pig and the rabbit were chosen for this purpose. The procedure consists of exposing surgically the organ to be examined and then transilluminating it with light transmitted to it by means of a quartz rod. Direct microscopic examination of the capillary network under various magnifications is then possible. The final trick is to record these observations on colored motion picture film.

Examination of the functioning lung presents various obvious difficulties. One of these is the question of respiratory motion. A method devised to control much of this motion has given us some advantages over the technique of Wearn[3]. Changes in the vascular patterns of these organs have been observed and recorded both before and during anaphylaxis. Over 200,000 feet of motion picture film have been exposed in the process. The problem now is one of interpretation. Available data now indicate that in anaphylaxis:

1. Arterioles in the lung and liver contract.
2. Efferent sphincters and central venules contract in the liver.
3. White blood cells stick to the vessel walls.
4. Clumps of intravascular elements appear in all vessels.
5. Flow in the peripheral vessels stops before the effective heartbeat ceases.

Other concurrent problems are under investigation in the Allergy Laboratory. The circulation of the stria vascularis of living mammals is being studied by similar methods in collaboration with Dr. Francis L. Weille. This area may well prove important in hearing, as the stria vascularis is thought to supply blood to the organ of Corti.

It is appreciated that anatomical details and physiological reactions, as well as manifestations observed following anaphylactic shock, vary in different animal species and that these observations in animals are not necessarily transferrable to man. It is also evident that the technique of direct observation as described above is not as yet applicable to the human being insofar as larger organs are concerned.

It has, however, been possible to observe the circulation of the bulbar conjunctiva of patients with severe asthma, both before and during cortisone therapy. It now appears that cortisone causes a diminution of the number of vessels in a given field with compensatory dilatation of those vessels which remain open. Intravascular clumps of cells form under cortisone therapy, and vessel walls become hazy, suggesting the presence of edema. These preliminary data must clearly be subjected to careful review.

The Allergy Laboratory is developing into a well-equipped workshop for the basic study of problems related to this branch of internal medicine. This includes communication with other laboratories throughout the country interested in similar projects. Ours is one of the older laboratories in the Hospital.

Progress has not been rapid, but we face the future with confidence that more can and will be done for those afflicted with allergic disease.

Walter S. Burrage, M.D.,
Head of Allergy Department

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send promptly all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in some few instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

General Surgery

Cope, O., Labbe, J. P., Raker, J. W., and Bland, E. F.
Pheochromocytoma and adrenal cortical adenoma: Report of a case with both tumors and discussion of their relation.
J. Clin. Endocrinol. & Metab. 12:875-880.

Nardi, G. L.
Metabolic studies following total pancreatectomy for retroperitoneal leiomyosarcoma.
New England J. Med. 247:548-550.

Laboratory Science

Black, S., Jones, M. E., Flynn, R. M., and Lipmann, F.
Mechanism of ATP-acetate reaction.
Federation Proc. 11:189.

Elliott, W. H.
Enzymatic synthesis of glutamine.
Federation Proc. 11:207.

Gregory, J. D.
Further purification and chemistry of coenzyme A.
Federation Proc. 11:222.

Gregory, J. D., and Lipmann, F.
The nature of the sulfur in coenzyme A.
J. Am. Chem. Soc. 74:4017-4019.

Levintow, L., and Novelli, G. D.
Enzymatic synthesis of coenzyme from pantethine and other fragments. (Abstract)
In Division of Biological Chemistry of the American Chemical Society: Abstracts of papers presented at Atlantic City, N. J., Sept. 14 to Sept. 19, 1952, pp. 33C-34C.

Lipmann, F., Jones, M. E., Black, S., and Flynn, R. M.
Enzymatic pyrophosphorylation of coenzyme A by adenosine triphosphate.
J. Am. Chem. Soc. 74:2384.

Nachmansohn, D., Ochoa, S., and Lipmann, F. A.
Otto Meyerhof: 1884-1951.
Science 115:365-369.

Neurology, Neurosurgery, and Psychiatry

Clark, L. D., Bauer, W., and Cobb, S.
Preliminary observations on mental disturbances occurring in patients under therapy with cortisone and ACTH.
New England J. Med. 246:205-216.

Cobb, S.
Review of neuropsychiatry for 1951.
A.M.A. Arch. Int. Med. 90:410-421.

Finesinger, J. E., Shands, H. C., and Abrams, R. D.
Managing the emotional problems of the cancer patient.
In Clinical problems in cancer research, Sloan-Kettering Institute Seminar, 1948-49 (pub. 1952), pp. 106-121.

Weisman, A. D.
Nature and treatment of tics in adults.
A.M.A. Arch. Neurol. & Psychiat. 68:444-459.

Ophthalmology

Donahue, H. C.
Congenital ectasia of the cornia.
A.M.A. Arch. Ophth. 48:154-160.

Otolaryngology

Kelemen, G.
Mechanical injuries of the hearing organ.
In American Academy of Ophthalmology and Otolaryngology Instruction Course, (loose leaves, no pagination).

Pediatrics

Butler, A.M.
The therapeutic implications of disturbances in water and electrolyte metabolism in diabetic acidosis.
In A symposium on the clinical and biochemical aspects of carbohydrate utilization in health and disease, Baltimore, The Johns Hopkins Press, pp. 106-114.

VOLUNTEER GROUPS

LADIES' VISITING COMMITTEE
MASSACHUSETTS EYE & EAR INFIRMARY

On October 29 the Committee invited the wives of the doctors on the Medical Staff to a meeting at the Nurses' Home. Dr. Charles L. Schepens, Director of our Retina Foundation, gave a very interesting talk on "Modern methods of treating separated retina". Miss Phyllis B. Scott, Secretary for the Eye Bank and Director of Volunteers, told of the many places in the Infirmary where volunteers are needed. We hope that some of the wives will be inspired to help.

The usual contribution has been given for Thanksgiving, to provide a favor for every patient's tray.

At Christmas the Committee gives wreaths for the doors, ice cream, candy, etc. for the hospital party, and a small present to each patient on the wards.

BOARD OF MANAGERS
VINCENT MEMORIAL HOSPITAL

The Board had its regular monthly meeting in the Vincent Room on Thursday morning, November 13. Before the meeting, the Vincent Hospital family joined the Board for a fifth birthday party. Although the original Hospital, located on Chambers Street, was founded in 1891, the Vincent has annually celebrated the dedication of its new building, which took place in November 1947.

This fall, the Board of Managers announced, with deep regret, the resignation of Miss Dorothy Rackemann as its president. Miss Rackemann, who has held this office for the past four years, has accepted the position of head of volunteers at the Massachusetts Memorial Hospitals. Mrs. George Lewis, Jr. is the new president of the Vincent Memorial Hospital Board of Managers.

Mrs. Arthur W. Allen was the Hospital's visitor for November, and Mrs. W. Arthur Dupee, Jr. was in charge of the patients' Thanksgiving party. Christmas Day plans for the patients are under discussion between Miss Corkum and the Board.

MGH STAFF WIVES HOSPITAL COMMITTEE

At our October 22 meeting the following officers were elected for the year 1952-1953:

Co-chairmen Mrs. Joseph C. Aub
Mrs. Richard H. Sweet
Hospitality Mrs. Walter Bauer
Mrs. Edward D. Churchill
Treasurer Mrs. Bradford Cannon
Executive Secretary
Mrs. Dana L. Farnsworth
Recording Secretary
Mrs. Grant V. Rodkey
Corresponding Secretary
Mrs. E. P. Richardson, Jr.
Publicity Mrs. John W. Raker

Plans for the coming year emphasize hospitality to MGH visitors from other countries and their families. In their honor a tea was given in the Medical Staff Room of the Bulfinch Building on November 20. Staff wives who had expressed a particular interest in extending hospitality to overseas visitors were also invited. Subsequently, many Staff members entertained visitors and their families in their homes at Thanksgiving. Those who would like to invite visitors from other countries for Christmas, or at any other time, may obtain information concerning them by calling either Mrs. Walter Bauer, UN 4-2335, or Mrs. Edward D. Churchill, BE 5-3718.

Mrs. Milford D. Schulz has arranged a series of afternoon concerts for patients, to be given in the Chapel twice each month. The first of this series was given on November 11, when Mr. Homer Whitford, Director of Music, McLean Hospital, gave an organ recital. Later in the month students from Boston University gave a program. On December 10 the Belmont Women's Chorale, Mary Loud, Director, will give a short Christmas cantata with carols. Mrs. Helen H. Cushing will give a program of Christmas carols and organ music shortly before the holiday. Additional volunteers are needed to wheel patients to the Chapel, as nurses cannot be spared to do this. Any help in this respect would be deeply appreciated. Please call the Volunteer Office at the Massachusetts General Hospital, LA 3-8200, Extension 257, between 9 A.M. and 12 noon or between 2 P.M. and 5 P.M.

DISTAFF CLUB

The November meeting of the Distaff Club took place in the Penthouse on Wednesday evening, November 19. Dr. Carlos Tejada, from Guatemala, a Fellow in Pathology at the Hospital, gave an interesting talk on Guatemala, illustrated by motion pictures. The hostesses were Jean Talbert (Mrs. Rhett Talbert), Lida Javid (Mrs. Manucher Javid), and Edith Essig (Mrs. Carl Essig).

On Saturday night, December 13, we will have our annual Christmas party. Dorothy Nielsen (Mrs. Talmadge Nielsen) is in charge of the arrangements. We are planning to extend the hospitality of the holiday season to the unmarried members of the House Staff and to the doctors and their wives from other countries who are at the M.G.H. We expect the party will be a very gay occasion.

Ladies' Visiting Committee
Massachusetts General Hospital

Christmas at the M.G.H. is no less than a miracle. Music flows through the corridors and into every nook and cranny, walls and windows suddenly blossom into gaily painted scenes, Christmas greens are restricted only by law, and parties spring up over night for young and old—for everyone who can attend.

One annual party that has been scheduled for many years is that given in the Moseley Rotunda, sponsored and arranged by the MGH Ladies' Visiting Committee in conjunction with Hospital personnel, and attended by all adult patients who have the permission of their doctors. This year it will be on Monday, December 22, at 2:30 o'clock, and for an hour or so before that time there may be seen streaming through the corridors an orderly procession of wrappered men and women—on foot, in wheel chairs, and in beds—accompanied by volunteer "pushers", all converging on the Rotunda to see the fun. Once there, they will be entertained by a happy combination of Hospital and outside talent. The exact nature of the former is a well-kept secret, but it is expected that the ever-popular singing cowgirl, Georgia May with her guitar, will be included again, plus the addition of the well-known accordion player, "Herbie" Sulkin.

Another party sponsored by the MGH Ladies' Visiting Committee is for the children on Christmas Eve, usually complete with Santa Claus, presents, puppets, and so forth. The arrangements for this party are largely carried out by the personnel of the Children's Ward and the Occupational Therapy Department, though members of the Visiting Committee are always welcome to attend.

Advisory Council
to the School of Nursing
Massachusetts General Hospital

A meeting of the Advisory Council was held on October 28, in Miss Sleeper's office. Mrs. W. K. Jordan, Chairman of the Council, outlined the program of study for the meetings to be held in 1952-1953. It is the desire of this Council to study each year, along with other current business, one specific problem related directly to nursing education in the Massachusetts General Hospital, in order to become familiar with the difficulties which confront the faculty of the School and the nursing and teaching staff of the Hospital.

During the winter of 1951-1952, the Council attended various series of lectures given to the students by both doctors and nurses, and also observed the teaching of students on the wards.

For the meetings to be held in 1952-1953, Mrs. Jordan, announced that the subject to be studied would be "Research at the Massachusetts General Hospital and its effect on nursing and nursing education". Miss Sleeper introduced Dr. Robert L. Berg, Executive Secretary of the Committee on Research at M.G.H. Dr. Berg outlined the research programs under way at the Hospital, pointing out the problems they present, in the carrying out of patient care, to the nursing staff and the student nurses. There are 800 nurses in the Hospital (including student nurses), 200 research workers (full- or nearly full-time people), and an equal or larger number of technicians. When the house staff of doctors and the visiting physicians are added to this number, and the many different programs of research considered, it is not difficult to understand that a well-coordinated program which includes research, teaching, and care of the patient presents a variety of problems.

In November

Miss Anne Healey, Head Nurse of the Metabolic Unit of the Pediatric Ward, Burnham Memorial Hospital, spoke to the Council on "Nursing in the Pediatric Research Project".

In December

The subject will be "The impact of medical research on nursing and nursing education on the General wards". Miss Sarah Rowley, Medical Supervisor, will speak on the impact on the medical units, and Miss Adele Corkum, Supervisor of the Vincent Memorial, will speak on the same subject as regards surgical wards.

In January

Miss Mary Quinlan, Orthopedic Supervisor, will continue with "The impact of research on the orthopedic units", and Miss Marie Rearick, Supervisor and Instructor in Neuropsychiatric Nursing, will talk on "Research as it concerns the psychiatric units".

In February

The Advisory Council will meet with the faculty of the School of Nursing.

In March

The annual meeting and election of officers of the Advisory Council.

In April

Review of new programs in basic nursing education.

Schedules for ward observation of student teaching have been given to Council members, and members have been asked to attend as many sessions as possible.

Massachusetts General Hospital
Volunteer Service Department

Mrs. J. R. Harding of Brookline was featured by the *Boston Traveler* as "The October volunteer of the month". Since 1944 Mrs. Harding has given 6,800 hours of volunteer service to the Massachusetts General Hospital.

Among more recent gifts to our Archives collection are:

From Mrs. Eleanor B. Cass (mother of Dr. John W. Cass, Jr., Assistant Physician at M.G.H.)—a copy of *Who's who in the East,* published in 1951.

From Mrs. Samuel Mixter—Dr. Joseph Pearson Oliver's diploma from Harvard Medical School. Dr. Oliver was Mrs. Mixter's great-uncle. He was a House Pupil in the Medical Department at M.G.H. in 1870.

From Dr. W. Jason Mixter—a leaflet of very special value to us, since it is the only copy we have seen and because it is the third oldest printed document in our collection of papers concerning the history of the Massachusetts General Hospital—preceded only by the Jackson and Warren letter of August 20, 1810, and the incorporation documents of 1810 and 1811.

This leaflet, soliciting financial aid for the proposed General Hospital, is dated May 1816. The lapse of years between the date of incorporation and this appeal for funds is readily understood when one remembers that the War of 1812 wreaked its havoc upon New England and its shipping more destructively than upon any other section of the country—beginning with the Embargo Act of 1807 and carrying through until the Battle of New Orleans in 1815. However, by the spring of 1816 New England had recovered sufficiently to warrant a resumption of the plan to build a General Hospital in Boston, and the following printed leaflet was prepared for distribution to all the cities and towns within the Commonwealth:

> Boston, May , 1816.
>
> Gentlemen,
>
> The inclosed papers will explain the object of this communication. The legislature of the Commonwealth having made it the duty of the Trustees of the General Hospital to solicit the aid of the public for this important institution, they have considered that no mode was more likely to be acceptable and successful than to request a number of liberal and influential gentlemen in each town of the Commonwealth to obtain a small specific sum in such town; thereby equalizing the exertion and the contribution, and enabling every part of the Commonwealth to share in the honor of its foundation, and to have an equal claim to partake in its advantages.
>
> In the amount requested from each Town, the Trustees have carefully restricted their request to a sum in no case exceeding and in almost all cases, less than its relative ratio of wealth, as far as they could obtain information on the subject, leaving by far the greatest part of the burden of this contribution to be borne by the Capital, and by towns distinguished for greatness of wealth and population.
>
> With these views the Trustees request you Gentlemen to act as a Committee for the Town of [written in longhand] Windham and to obtain and remit to *James Prince Esq.* Treasurer

No. 36 in a series of Staff photographs
Mr. Henry J. Murphy, Assistant Director

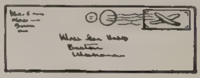
of the Massachusetts General Hospital Corporation, if possible, a sum not less than [written in longhand] 200 dollars, by subscription, in any form and in any amount, which will be likely best to effectuate the object and to equalize this charity among the benevolent.

Lest this establishment should be considered of a local nature, the Trustees take the liberty to observe that it is the great object of this institution to enable persons in all parts of the Commonwealth to avail themselves of the best medical and surgical aid, which our country affords, under the most advantageous circumstances. The Trustees also hope that the proposed asylum for the insane, by the liberality which they trust will characterise the contributions to it, will, at no distant period, relieve, not only many individuals, labouring under this heaviest of human calamities, but also all the towns of this Commonwealth of a great part, if not the whole of the burden, to which they are at present subject for their superintendance and support.

We rely gentlemen upon your co-operation in our exertions to attain this great object, and request that a return may be made of the result in your town, to either of the Trustees or to the Treasurer, JAMES PRINCE, ESQ. on or before the first day of August next.

We are Gentlemen, respectfully yours, &c.
(signed) T. H. Perkins
Josiah Quincy
Jos. May
Daniel Sargent
Tristram Barnard
Rd. Sullivan

When Dr. Mixter brought the leaflet in he asked us if we knew where the town of Windham is. We didn't, but said we would consult our road maps and let him know. Said maps gave no such town in Massachusetts, and this started us off on the search for its location. No geographies or atlases of that period produced the name of such a town. Finally, we took our problem to the Boston Athenaeum, the Boston and Brookline Public Libraries, and the Massachusetts Historical Society, among other places, offering the suggestion that perhaps two or more small towns of that era (one of which was Windham) might have joined together into one single town since the date of this paper. But still no solution was forthcoming until, quite by chance, one of the people with whom we talked mentioned the town of Windham, near Portland, Maine, as being the only one she could find near this locality. And with that, immediately, the flash of understanding struck! Of course, *that* was the town indicated in this paper, for Maine was a part of Massachusetts in 1816. Maine did not become a separate State until 1820. And so—for what it may be worth to all those whose ancestral lines carry them to Maine in 1816—beyond a doubt your forebears contributed to the fund which made our Massachusetts General Hospital possible.



New addresses:—

Dr. Mack L. Clayton (clin. a. *Or.* 1952), 1765 Sherman St., Denver, Colo.

Dr. Richard E. Goldsmith (clin. & res. fel. *M.* 1950), 229 Doctors' Bldg., Cincinnati, Ohio.

Dr. Ferdinand Haase, Jr. (past a. dir.), Albany Hospital, New Scotland Ave., Albany, N. Y.

Dr. Luis V. Larralde (gr. stud. a. *Path.* 1952), 23 #1103 Vedado, Havana, Cuba.

Dr. Leon Levintow (res. fel. *Biochem.* 1952), National Cancer Institute, National Institutes of Health, Bethesda 14, Md.

Dr. John D. Reeves (r.p. *R.* 1951), Laboratory of Biophysics, National Cancer Institute, Bethesda 14, Md. (effective Jan. 1, 1953).

Brief bits:—

Dr. Earle M. Chapman, Associate Physician on our Staff, addressed the Clinical Congress of the Connecticut State Medical Society, in New Haven, on September 17. His subject was "The medical management of hyperthyroidism". He also talked on the same subject before the Academy of Medicine, at Binghamton, N. Y. on October 21.

Dr. William R. Christensen (*W.M.* 1943) is now in the Department of Radiology, Salt Lake City County General Hospital, 2033 South State St., Salt Lake City, Utah, according to a very reliable source of information, but not from the Dr. himself (who has not notified us of a new address). We understand he is also Professor of Radiology at the University of Utah. Right, Doctor?

Dr. Edward D. Churchill, Chief of our Surgical Services, was a guest of the Excelsior Surgical Society meeting in Pittsburgh on October 24 and 25. The annual Churchill Lecture was given there by Dr. Francis D. Moore, a member of our Board of Consultation. On October 27 and 28 Dr. Churchill was guest speaker at a meeting of the Georgia Chapter of the American College of Surgeons, held in Columbus, where he spoke on "Wound healing" and "Surgical research". On November 6-8 he was guest lecturer at the Rocky Mountain Harvard Medical Alumni Association meeting in Denver. His subject was "The segmental structure of the lungs". On Saturday evening, November 8, he was a guest at an informal dinner and talk with the Denver Academy of Surgeons.

A letter, written in October, has arrived from Lt. John H. Kennedy, MC, USNR (a.r.s.). His address at that time was H & S Co., 1st Med. Bn., 1st Marine Division, c/o Fleet Post Office, San Francisco.

A note of apology for not answering your earlier inquiry as to my whereabouts since I left the White Building. I went on active duty with the Navy August 1, 1951, after a short vacation on Marthas Vineyard. I spent 2½ months at Chelsea Naval Hospital, doing ENT surgery, and then 10 months at the Naval Hospital at San Diego on the surgical service. After a month's indoctrination at Camp Pendleton, I was sent to the 1st Marine Division, where I'm at present doing a little surgery but am expecting assignment to a more forward unit any time.

At present I'm between Munsan and Seoul—closer to the former. We are within view of the searchlight marking the truce talks, and it seems absurd that the enemy lobs artillery over this corridor and into our positions.

While I was in San Diego, Robert Hopkins spent the evening with us. Robb Rutledge also has been out this way.

THE NEWS

No. 119 Boston, Mass. January 1953

McLEAN HOSPITAL

Clinical teaching and research activities continue at McLean Hospital, and since a more general note about this branch of the Massachusetts General Hospital in Waverley appeared in THE NEWS some time ago, this time we will give some not-too-technical notes on research activity and make some comments on the Clinical Service. Two different laboratories will be discussed.

The McLean Hospital Research Laboratory was dedicated in 1946 for research in the field of neuropsychiatry, using the tools of the basic medical sciences—chiefly biochemistry. The Director of Scientific Research has been Dr. J. Folch-Pi, who has an advisory committee now consisting of Drs. Stanley Cobb, D. D. Van Slyke, A. B. Hastings, R. Lorente de Nó, and Walter Bauer. The present professional staff consists of five M.D.'s and two Ph.D.'s in biochemistry. The laboratory building has 8,500 square feet of floor space, and houses excellent biochemical and histological laboratories with elaborate equipment, including three constant-temperature rooms (at 20°C., 4° C., and –15° C.), enabling great facility of procedure.

From the outset the work of the laboratory, as described for us here by Dr. Folch-Pi, has been aimed at the ultimate goal of establishing the "chemical anatomy" of the brain — that is, the distribution of its biochemical constituents in relation to its histological structure, and of extending such study to the brain in nervous and mental disease.

The initial step was the development of an array of new procedures and methods for isolation and identification of structural components of brain. Three new types of compounds have been discovered which exhibit features quite at variance with previously known tissue components. One of these types has been termed the proteolipides. These are lipide-protein complexes having as constituents protein and lipide moieties arranged so that the protein forms the core of the complex and the lipide the surface, thus giving them the solubility properties of lipides. Three of these substances have been isolated and one crystallized. The second group of new brain compounds are the strandins, which are lipide-carbohydrate complexes of high molecular weight. The third new group of compounds of normal brain are the phosphatide-peptides. In general, the conclusion seems unescapable that most, if not all, of the lipides and the proteins in the brain are not free but are combined as different types of lipoproteins.

Comparative studies on the chemical composition of the brain at different stages of postnatal development are in progress and show, for instance, that proteolipides, while absent in embryonal brain, appear coincident with the onset of myelinization, thus indicating that they are a component of myelin.

A second line of work, under Dr. Alfred Pope, has been the use of the principles and techniques of quantitative histochemistry for studying the distribution of certain enzymes within the architectonic layers of the cerebral cortex and correlating the results with details of the anatomical fine structure. In general, it appears that both in animal and in human cortex certain enzymes concerned with carbohydrate and protein metabolism (coenzyme I, cytochrome oxidase, dipeptidase) are localized principally in nerve cell bodies. Others presumed to be more immediately concerned with the conduction and transmission of nerve impulses (acetycholinesterase and adenosinetriphosphatase) are associated primarily with the plexuses of axones and dendrites. Comparative studies on cortical enzymology and neuropathology in relation to mental disease are in progress.

In addition, comparative biochemical studies have been made on brain tumor tissue and, by Dr. Huntington Porter in collaboration with Dr. D. Denny-Brown, upon the role of copper metabolism in Wilson's disease. Work also is in progress, in collaboration with Drs. R. D. Adams and B. Waksman, aimed at determining the identity of the antigenic factor in brain that causes experimental allergic encephalomyelitis.

* * * * *

The Laboratory of Clinical Physiology is under the direction of Dr. Mark Altschule, who also does the work in Internal Medicine. This laboratory performs the functions of a hospital clinical laboratory and, in addition, has a program of investigative work carried out on patients in the Hospital.

The initial project of the laboratory, described here by Dr. Altschule, consisted of a study of the immediate physiology of electroshock. This work yielded data on the mechanisms of the pulmonary and cardiovascular complications of electroshock therapy and resulted in improvements in procedure designed to prevent these complications. For example, the finding that patients with hypersensitive carotid sinus reflexes were prone to develop heart block or cardiac standstill during shock treatments led to the routine testing of all patients likely to receive such treatments. Atropine, given to patients with hypersensitive carotid sinuses before each treatment, prevents the occurrence of the potentially fatal cardiovascular complications.

In recent years the investigative work of the laboratory has taken the direction of study of the status of the anterior pituitary-adrenocortical system and of the intermediate carbohydrate and fat metabolism in psychosis. It has been known for half a century or more that carbohydrate and fat metabolism are disturbed in schizophrenic, manic-depressive, and involutional psychoses. It has been shown that this change is partly owing to starvation and it is probable that vitamin B deficiency also plays a role in many instances. However, even when these factors are controlled, about half of the recently admitted psychotic patients at the McLean Hospital still have abnormal glucose tolerance tests. The metabolism of lactate is even more regularly affected and that of citrate is quite regularly abnormal. It is evident that the utilization of small carbohydrate molecules is impaired in the psychoses studied and this abnormality may, in some instances, produce changes extending back in the chain of carbohydrate utilization to the glucose level. The nature and mechanism of the fundamental disorder is not yet clear. The possible influence of the adrenal cortical hyperactivity present in patients with psychoses of recent onset, of the commonly occurring glutathione deficiency, and of other factors is being studied. The importance of this type of study is readily apparent: the proper function of brain tissue, especially in the higher brain centers, depends largely upon the utilization of carbohydrates, and therefore impairment of normal metabolic processes involving carbohydrate may be highly significant in the production of evidences of abnormal function of the higher cerebral centers.

Disturbances in carbohydrate utilization might be expected to give rise to, or possibly be caused by, abnormalities in phosphate metabolism. A start in the study of phosphate metabolism has been made and it appears from the few experiments thus far made that abnormalities are present in psychotic patients.

* * * * *

Concerning the Clinical Service at McLean, we would ask, "What is it like to be admitted to the Hospital as a patient?" Perhaps an answer can be inferred from a description of the facilities and functions of the Clinical Service. We try to receive and treat each patient very individually and personally, thinking of each on multiple levels, such as the medical, physiological, surgical, environmental and social, psychodynamic, occupational, and religious. Thus, the Hospital must have complicated facilities, provide a human situation for the patient to live and grow in, and be at the same time observing and scientific. Various kinds of expressive and group activities are furthered among the patients by the large number of nurses (one nurse to five patients as averaged around the clock), by the different departments—particularly the Occupational Therapy Department and the gymnasiums, and also by the library, physiotherapy, ward activities, beauty parlor, coffee shop, and entertainments. For instance, during the past Christmas season there were appropriate services, dinners, teas, and sings. Each patient's feelings about his surroundings, his illness, and other people are considered. The physicians work with the patients' families and referring physicians, and make historical, physical, and psychological evaluations. Psychiatric treatment, of course, includes the physical and physiological — especially the use of insulin and electric shock, but the most time-consuming treatment is psychotherapy.

The verbal therapies take a third of the physician's time, as compared with a fiftieth of the time devoted to insulin and electric shock. There is much psychotherapeutic work to be done in rehabilitating and readjusting these people's emotional lives through psychotherapy, so as to bring about more maturity and the solution of conflicts. It is conspicuously easy to bring about remission of many acute psychoses through physiological treatment and through hospitalization, time, and rest; but we feel that the changes in emotional relationships which are brought about through psychotherapy are of great value to many people in the prevention of future mental illness. The results are not susceptible to exact measurement.

About fifteen patients live on each hall, and this plan has greater socializing than restricting aspects. Living conditions are physically pleasant — single rooms, good food, opportunities for activity, and beautiful grounds. Our policy is against isolation from the family. Visits to the patient are encouraged, and many patients visit their own homes. It is significant that after the first week of stay over half of our patients are voluntary.

Although the Hospital population has not increased in the last decade (about 200 patients), the admission rate has doubled, so that approximately a quarter of the beds are taken by acute cases which stay on the average of nine weeks, and are discharged as recovered or improved. There are about 300 admissions a year. We have about 450 employees.

Paul M. Howard, M.D.,
Acting Chief of Service

* * *

Dr. Stanley Cobb, Chief of our Psychiatry Service, received the honorary degree of Doctor of Science during the opening ceremonies of the Psychiatric Institute of the University of Maryland, held in Baltimore November 17-19. The citation which accompanied the degree was read by Dr. Jacob E. Finesinger, past Psychiatrist on our staff and now Professor of Psychiatry at the School of Medicine, University of Maryland.

Dr. Cobb gave a talk on "Some clinical changes in behavior accompanying endocrine disorders" at the Tuesday afternoon meeting of the ceremonies.

Dr. Francis M. Rackemann, a member of our Board of Consultation and past head of our Allergy Clinic, received the Medal of Public Health at the Armistice Day ceremonies held at the French Consulate in Boston. The medal, presented by M. Charles-Roux, Consul General of France, acting for the French Government, was given in recognition of Dr. Rackemann's outstanding work in the field of allergy.

Dr. Stanley M. Wyman and Dr. Laurence L. Robbins won the Silver Medal—the highest award and the only Silver Medal given this year at the annual meeting of the American Roentgen Ray Society, held in Houston, Texas, last September. This tribute was in recognition of their exhibit entitled "The roentgen demonstration of parathyroid adenoma".

The cornerstone of our new nurses' residence, Bartlett Hall, was laid on December 8. Mr. Lloyd D. Brace, a member of our Board of Trustees and the Chairman of the Trustees' Committee on Nursing, wielded the trowel for the laying, and Miss Ruth Sleeper, Director of our School of Nursing and Nursing Service, gave a short talk on matters appropriate for the occasion. We quote this brief passage from Miss Sleeper's address:

> The name chosen for this new residence bespeaks our appreciation to the chief donor. It memorializes for the first time among the Hospital buildings the name of the Reverend John Bartlett, the Boston minister whose interest in providing humane care for the mentally ill of this community led to the founding of the first two units of the Massachusetts General Hospital—the McLean and the General Hospitals.

A gift of $560,000 from the Mary Bartlett Noyes estate was the initial donation to the $1,000,000-building fund. Mrs. Noyes was the Reverend John Bartlett's great-granddaughter. A portrait of John Bartlett and a photostatic copy of his letter of March 9, 1810 which resulted in the founding of the Massachusetts General Hospital, hang in our Archives Room.

Perhaps the most impressive moment during the ceremonies came when Miss Sleeper placed within the cornerstone a copper box containing the following items:

1. A copy of the *Boston Herald* of Monday, December 8, 1952
2. A copy of Miss Sleeper's remarks made at the laying of the cornerstone, with a picture of the building taken on December 8, 1952
3. A copy of the will of Mrs. Mary Bartlett Noyes
4. A copy of the current catalogue of the School of Nursing
5. A sample of the cloth used for student nurses' uniforms in 1952
6. A copy of the Nurses' Alumnae Association *Quarterly Record* of June 1952, containing articles about the School of Nursing: (1) A list of residences occupied since 1873 by student and graduate nurses at the Massachusetts General Hospital, compiled and signed by Miss Sally Johnson, Director *Emeritus* of the School of Nursing and Nursing Service; (2) A report of activities on March 17, 1952, when ground was broken for Bartlett Hall; (3) "We study our basic program", an article by Miss Sleeper describing the School program
7. A count of nursing personnel on December 1, 1952, in the General Hospital, the Out-Patient Department, Baker Memorial, and Phillips House
8. A copy of the *Massachusetts General Hospital News* of November 1952, containing an article entitled "The team concept in nursing" as used in the Baker Memorial, by Dorothy Perkins Newcomb, R.N.
9. A copy of the *Massachusetts General Hospital World* of November 1952, containing an article on "Award of service pins on Ether Day, October 16, 1952

An etched inscription on the box reads: "To the future nurses of the Massachusetts General Hospital from the nurses of the Massachusetts General Hospital, 1952 A.D." And we could not help but wonder at that moment when Miss Sleeper placed the box inside the cornerstone, if, perhaps, a few hundred years from now, a scene similar in some respects to that which occurred at the tomb of Tutankhamen in Egypt in 1922 might not be duplicated right here on our own grounds.

The Board of Trustees, at their meetings on November 14 and 28, voted:

To accept the resignation of Dr. Crawford S. Brown, in order that he may enter the service of the U. S. Navy;

To accept with regret the resignation of Dr. Lamar Soutter as Assistant Surgeon and to appoint him as Clinical Associate in Surgery, effective as of November 1, 1952;

To revise the vote of October 31 regarding Dr. Jerome L. Weinberger and to appoint him as an Assistant in Psychiatry.

To appoint:

Dr. Norman R. Bernstein as Assistant Resident in Psychiatry, beginning July 1;

Dr. William D. Cochran as Assistant Resident on the Children's Medical Service, beginning July 1;

Dr. Betty S. M. Eo-yang as Assistant Resident in Anesthesia, beginning January 1;

Dr. Sigurd B. Gundersen, Jr. as Second Assistant Resident in Surgery, beginning December 1, 1952;

Dr. Louis F. Johnson, Jr. as Assistant Resident in Anesthesia, beginning January 1, so that he may complete his residency training which was interrupted by the Korean War;

Dr. Robert B. Kearsley as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. James A. Petersen as Second Assistant Resident in Radiology, beginning July 1;

Dr. John F. Radebaugh, Jr. as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Savitri Ramcharan as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Jack H. Rubinstein as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Edgar J. Schoen as Assistant Resident on the Children's Medical Service, from February 1, 1953 through January 31, 1954, in order to complete his residency training which was interrupted by service in the U. S. Navy;

Dr. James M. Shannon as First Assistant Resident in Surgery, beginning January 1;

Dr. Robert S. Shaw as Assistant in Surgery, effective January 1, and to allow him to see a limited number of private patients at the Hospital;

Dr. Robert S. Shaw as Assistant Director of the Blood Bank;

Dr. Stanley Sober as Assistant Resident in Orthopedic Surgery, beginning January 1;

Dr. Ruth S. Weiss as Assistant Resident in Psychiatry, for the period April 1 through June 30;

Dr. Weldon W. West as First Assistant Resident in Surgery, beginning January 1.

At their meetings held on November 12, 19, 26, and December 3, the General Executive Committee voted:

To change the title of Dr. Henry M. Lloyd from Research Fellow in Medicine to that of Clinical and Research Fellow in Medicine.

To promote:

Dr. Wilma J. Canada from the position of Second Assistant Resident in Radiology to that of First Assistant Resident in Radiology, beginning January 1;

Dr. Freddy H. Frankel to the position of Resident in Psychiatry, for a period of three months, beginning January 1;

Dr. George M. Perrin from the position of Intern to that of Assistant Resident on the Children's Medical Service, for the period July 1, 1953 through June 30, 1954;

Dr. Robert B. Rosen from the position of Intern to that of Assistant Resident on the Children's Medical Service, for the period July 1, 1953 through June 30, 1954;

Dr. Paul M. G. St. Aubin from the position of First Assistant Resident to that of Resident in Radiology, beginning January 1;

Dr. Frederick G. Shaffer from the position of Third Assistant Resident in Surgery to that of Assistant Resident on the Urological Service, for the period March 1, 1954 through June 30, 1954, and as Resident from July 1, 1954 through June 30, 1955;

Dr. Elizabeth H. Sprague from the position of Intern to that of Assistant Resident on the Children's Medical Service, for the period January 1, 1954 through December 31, 1954.

To continue the appointments of:

Dr. Javier Correa as Clinical and Research Fellow in Medicine for a second year, beginning December 1, 1952;

Dr. Lawrence J. Essember as Assistant Resident on the Children's Medical Service, for the period July 1 through December 31;

Dr. Roberto F. Santos as Clinical Fellow in Medicine, through February 28.

To reappoint:

Dr. Leonard Atkins as First Assistant Resident in Pathology for another year, beginning July 1;

Dr. Fairfield Goodale, Jr. as First Assistant Resident in Pathology for another year, beginning July 1;

Dr. Raymond A. Justi as Second Assistant Resident in Pathology for the year beginning July 1;

Dr. Hanna Klaus as First Assistant Resident in Pathology for another year, beginning July 1;

Dr. Alexander C. Ritchie as Second Assistant Resident in Pathology for another year, beginning July 1.

To appoint:

Dr. Glenn E. Behringer as Clinical Assistant in Surgery, effective as of July 1, 1952;

Dr. Nibhondh Chunnanand as Graduate Student Assistant in Surgery for one year, beginning November 12, 1952;

Dr. Garnet J. H. Colwell as Clinical Fellow in Physical Medicine, beginning July 1;

Dr. Ismail El-Sebai as Research Fellow in Surgery, for a period of ten months, beginning November 15, 1952;

Dr. Charles Gaylord as Clinical Fellow in Radiology, beginning July 1;

Dr. Charles L. Minor as Clinical and Research Fellow in Surgery, for the period December 1, 1952 through June 30, 1954;

Dr. Fernando M. A. M. P. de Padua as Graduate Student Assistant in Medicine, assigned to Cardiology, effective as of October 1, 1952.

COORDINATING COMMITTEE

As has already been reported in THE NEWS, the Coordinating Committee consists of two representatives (the chairman and one other member) from each of the following groups:

1. The Ladies' Visiting Committee of the Massachusetts Eye and Ear Infirmary
2. The Board of Managers of the Vincent Memorial Hospital
3. The Ladies' Committee of the Bay State Medical Rehabilitation Clinic
4. The MGH Staff Wives Hospital Committee
5. The Distaff Club
6. The Ladies' Visiting Committee of the Massachusetts General Hospital
7. The Advisory Council to the School of Nursing of the Massachusetts General Hospital
8. The Massachusetts General Hospital Volunteer Service Department

We hope to give an account of the activities of the Coordinating Committee in an early issue of THE NEWS.

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

The November 2 tea given by the MGH Staff Wives Hospital Committee for doctors from other lands proved to be so very successful that plans are being made for a similar tea to be given on January 20 in the Medical Staff Room of the Bulfinch Building between 4:30 and 6 P.M. These occasions afford an excellent opportunity for new friendships to be made between MGH staff families and visiting doctors and their families from other countries. There are now here at Massachusetts General 120 such visitors, from 48 different countries. Attending the November tea were representatives from the English Speaking Union, the Pan-American Society, and the International Institute, as well as those members of our Committee who had expressed a desire to meet our foreign contingent. Every one of the 96 visitors who attended the tea was invited to an American home for Thanksgiving—a very gratifying accomplishment, indeed!

In the Brick Corridor, near the house post office, a bulletin board labeled "Newcomers" has been designated for the use of the Staff Wives Hospital Committee. On it will be posted the current *Harvard Gazette,* general information for newcomers to the M.G.H., and notices of recreational opportunities. A large envelope for inquiries and suggestions is attached to the board, and it is hoped that this will prove useful to those who desire further information or special help.

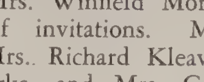
If you ever have theatre or concert tickets which you find you are unable to use, it would be very much appreciated if you would turn them over to the Hospital. In such instances please call Mrs. Weiss's office—LA 3-8200, Extension 828.

DISTAFF CLUB

Mrs. Frank C. Wheelock, Jr. and Mrs. Grant V. Rodkey of the Staff Wives arranged an outing to Babson Institute in Wellesley for a group of Distaff members on Monday, December 8. Mrs. Perry J. Culver, Mrs. Winfield S. Morgan, III, Mrs. Arthur S. Pier, Jr., Mrs. George S. Richardson, Mrs. Donald West, and Mrs. Earle W. Wilkins, Jr., acted as hostesses and entertained a large group of children at Mrs. Wheelock's home while their mothers went on the tour. Refreshments completed a most enjoyable afternoon.

The December meeting of the Distaff Club was our annual Christmas Punch Party for the MGH House Staff, and their wives or "dates", held on December 13 at 8:30 P.M. in the Penthouse. Mrs. Talmage Nielsen was chairman of the party. Mrs. Winfield Morgan was in charge of invitations. Mrs. George Nardi, Mrs. Richard Kleaveland, Mrs. John Burke, and Mrs. Gerald Foster decorated the Penthouse in festive style. Mrs. Stanley Crawford, Mrs. William Owen, Mrs. Robert Dudley, and Mrs. Rhett Talbert provided the refreshments. Mrs. Wilbur Thomas, Mrs. I. V. Manly, Mrs. Martin Levene, Mrs. Thomas Peebles, Mrs. John McClung, Mrs. Stephen Krane, and Mrs. Samuel Brendler were hostesses.

Some of our Distaff members have assisted Mrs. James H. Burns on three occasions by pushing wheel chair patients to and from concerts given in the Chapel and the Moseley Rotunda. The concerts are arranged by the MGH Staff Wives Hospital Committee. A group of Distaffers also acted as hostesses at the MGH family Christmas party for the children on December 23 and at the dance for adults given later in the evening.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in THE NEWS as a convenience for our readers. For that reason we ask you to send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS.

All requests for reprints are to go to the individual authors.

The following new titles have been received:

Biochemistry

Matoltsy, A. G.
A study on the structural protein of the vitreous body (vitrosin).
J. Gen. Physiol. 36:29-37.

Dermatology

Blank, I. H., and Miller, O. G.
A study of rubber adhesives in shoes as the cause of dermatitis of the feet.
J.A.M.A. 149:1371-1374.

Frazier, C. N.
The treatment of acute dermatitis: Guiding principles.
In M. Clin. North America 36, No. 5: pp. 1435-1443.

General Medicine

Hardy, H. L.
Clinical evidence for the latent and additive action of benzol with other toxic insults: Report of two cases.
Arhiv Az Higijenu Rada (Yugoslavian journal) 3, B.R. 1:1-6.

Hardy, H. L.
Experience accumulated in three years of an occupational medical clinic.
Indust. Med. & Surg. 21:424-426.

Hardy, H. L.
Ionizing radiation, by A. Hamilton and R. T. Johnstone. (Review)
Oxford Med. (loose-leaf) 21, 663:150-177.

General Surgery

Wight, A., Weisman, P. A., Rovit, R. L., and Cope, O.
Adrenal hormones and increased capillary permeability of burns: An experimental evaluation.
A.M.A. Arch. Surg. 65:309-317.

Laboratory Science

Blank, I. H.
Factors which influence the water content of the stratum corneum.
J. Invest. Dermat. 18:433-440.

Frazier, C. N., Bensel, A., and Keuper, C. S.
Further observations on the duration of spirochetemia in rabbits with asymptomatic syphilis.
Am. J. Syph., Gonor. & Ven. Dis. 36:167-173.

Neurology, Neurosurgery, and Psychiatry

Bakay, L.
Studies on blood-brain barrier with radioactive phosphorus. II. Hypophysis and hypothalamus in man.
A.M.A. Arch. Neurol. & Psychiat. 68:629-640.

Bonner, F., Cobb, S., Sweet, W. H., and White, J. C.
Frontal lobe surgery in the treatment of pain, with consideration of postoperative psychological changes.
Psychosom. Med. 14:383-405.

Farnsworth, D. L.
Psychiatry and higher education: Practical applications of psychiatry in a college setting.
Am. J. Psychiat. 109:266-271.

Lorenz, M.
Language concepts as related to psychiatry.
Quart. Rev. Psychiat. & Neurol. 7:123-138.

Ophthalmology

Leahey, B. D.
A socket stretcher for deformed sockets.
Tr. Am. Acad. Ophth. 56:279.

Leahey, B. D.
Thermal burns of the eye and adnexa.
Am. J. Ophth. 35:1077-1088.

Social Hygiene

Frazier, C. N.
The sexes in a restless world.
J. Social Hyg. 38:323-327.

Surgery—Reconstructive

Cannon, B.
The place of the plastic surgeon in medicine.
Rhode Island M. J. 35:477-479.

Cannon, B.
Testimonial to Dr. V. H. Kazanjian.
Plast. & Reconstruct. Surg. 9:294-298.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Leroy A. Schall, Chief of our Otolaryngological Service, flew to El Salvador as guest of honor at the First Congress of Otolaryngology of Central America. At the Congress, which met from December 12 to 14, Dr. Schall delivered six lectures on ear, nose, and throat subjects.

At the December 17 meeting of the Board of Managers, Dr. John R. Richardson was appointed Surgeon for Bronchoscopy and Esophagoscopy in the Department of Otolaryngology. Dr. Richardson has been serving on the staff as an Associate Surgeon.

The Managers confirmed the promotions of Dr. John E. McKeigue and Dr. Maurice Ruben from Assistants in Otolaryngology to Assistant Surgeons.

Other appointments on the Ear, Nose and Throat Service were announced at the Executive Committee meeting of the Board of Managers on November 10: Drs. John Trakas, Frederic J. McIntire, Jr., and Morris Swartz will join the Infirmary staff as Assistants in the Otolaryngology Department.

Several members of the staff took part in the December 17 meeting of the New England Ophthalmological Society, held at the Infirmary. Dr. Robert R. Trotter of the Howe Laboratory spoke on "Tonography", and Dr. Charles L. Schepens of the Rentina Service discussed "Scleral buckling operations in cases of retinal detachment".

At the evening session of the meeting, Dr. William Stone, Jr., Assistant in Ophthalmology, gave a talk on "A plastic artificial cornea: Preliminary report".

Writing does not come easy to me. As I start out, I feel insecure; I am confused and my thoughts are muddled. I am supposed to write about India from the point of view of an Indian—to convey to my friends at the M.G.H. the heart of this complex experience of being an Indian. I find this a difficult assignment. I left India seven years ago and it was my fate not to live there during the turning-point in her history. In the past seven years, under the impact of science, technology, ideologies, and personalities, I must have changed and I am sure I do not look at India today as I did when I was there. The impact has been so great and the influence so deep that I would feel more at ease writing about my own country from an American viewpoint.

I asked several of my friends what I should write about. They showed a wide range of interest and the questions they asked were numerous: Tell us something about the culture of the country. Do you really believe in this stuff about Karma and reincarnation? Is there any justification for the caste system? Is it true that marriages are arranged entirely by parents and that husband and wife meet as complete strangers? How does the Indian feel toward the British? Will India stay with the democracies or will she go over to the communists? What do you think about the Point IV Program? What is the calibre of present leadership in the country? What are the chief medical problems? Is it wise to start any intensive public health measures? Will India be able to support her ever-increasing population? Will birth control measures succeed? Tell us something about Yoga. Is it true that some Indians can go without food and air for days? How do you reconcile that with what you have learned about human physiology and chemistry? I shall try to answer some of these questions. My answers will not satisfy me. I do not expect them to satisfy anybody else.

Again and again I have found myself unequal to the task of analyzing the culture of a country. The subject seems to me too complex for adequate analysis. Hardly any trait of culture can be understood when taken out of its general setting. To grasp the meaning of a culture we must understand the individual as living in his culture, and the culture as lived by individuals. We need to have an intimate knowledge of the great gamut of customs, institutions, and ways of thinking which exist in a country. It seems absurd to me that I could ever really grasp the culture of America without having lived here for a few years. Western civilization has spread itself more widely than has any other local influence. Moreover, it has standardized itself over most of the globe. The average westerner has been led, therefore, to accept a belief in the uniformity of human behavior. He has never seen an outsider, perhaps—or the one he has seen has already been westernized. If he has traveled, he has very likely been around the world without ever having stayed outside a cosmopolitan hotel. He knows little of any ways of life but his own. The uniformity of custom, of outlook, that he sees spread about him seems convincing enough. He accepts without more ado the equivalence of human nature and his own culture standards. The relativity of what is considered social or asocial, normal or abnormal, is not seen in proper light.

Some educated Hindus tend to be a little self-conscious or apologetic about the customs of the poor millions in India, and are unwilling to attribute to them anything more than a gross, crude representationalism. The fact is that the villager's crudest representationalism is the end product—under the conditions of his life, surrounded as he is by threatening elements, adverse forces of economy and social structure—of the highest normative concepts in Hindu thought. The universal spirit, as most Hindus understand it, wears the present world as a garment; all persons and things are manifestations—forms taken by that spirit. The individual comes and goes as a form, but his shred or strand of the spirit goes on into other forms until, in the end of its pilgrimage, it is united with the supreme. All Indians know the concept of soul and oversoul, and they know intimately, from earliest childhood, the concept of the cycle of rebirths. It is not necessary to be able to read books in order to understand these ideas. They are expressed in many ways throughout the life of any Hindu, and he can hardly get through a single day without being reminded of them in the details of life.

What is distinctive in the broad mass of the Hindu people, as compared with all other great divisions of humanity, is the unquestioning, and largely unthinking, acceptance of transcendental reality in the common consciousness. The Hindu acquires this consciousness early. Long before he has learned to formulate his beliefs it is deep within him, ineradicable by subsequent surface processes. The universality of the spirit, the participation of each person in it, the transmigration of souls, the ultimate "realization of God" as a possibility for every man born —all these ideas, which are philosophical or religious in the West, are part of the most intimate mind of the most ordinary Hindu. Karma and caste are deeply imbedded in the whole life of India. Their influence permeates every part of the collective existence and cannot be separated from society, politics, literature, or thought in general. It is because religious or philosophical concepts long ago took social form that Hindu life differs so sharply from any known in the West—or, for that matter, in the East outside of India.

At some time in the prehistoric twilight, the sages of old perceived a continuity of the spirit from life to life and evolved the doctrine of reincarnation or rebirth. "Birth is inevitably followed by death and death by rebirth." From the earliest known period this has been the firm conviction of Hinduism. The rebirths are indefinite in number, depending upon the actions performed by the soul's garment, i.e., the embodied life, on earth. This world is Karmabhumi—the land of action, and what we do here constitutes our Karma—the burden of deeds upon our souls. If our Karma contains goodness and wisdom, our spirit is then reborn in a higher state of consciousness, nearer perfection and more harmonious with the Divine. This process goes on until the soul, at last, at whatever period that may be, attains perfection and is united with the supreme and infinite existence. Nothing we can do in this earthly life can possibly exempt us from the pains or pleasures which are our legacy from preceding lives, although we can, in this life, so build our Karma that the next life will be a step higher. We may also conduct ourselves in such a way that the next life will be a recession rather than an advance toward perfection.

Karma—deeds or action—governs the Hindu's terrestrial activity to a considerable extent, and is directly responsible for the caste system. We are born into a certain caste because our Karma has so determined it. We improve our Karma by fulfilling the duties of that caste, whatever it may be, without attempting to escape them or mitigate their rigors. There are seven or eight hundred main castes in India. All of them are supposed to fall within the great fourfold division of function made in the Vedic times: the Brahmin (teachers and educators), the Kshatriya (warriors and rulers), the Vaisya (agricultural, industrial, and commercial classes), and the Sudra (working and serving classes). These functional subdivisions no longer govern function. The professions, which rely upon a thick superstructure of westernized education—such as medicine, the law, and teaching in the higher institutions of learning—draw their recruits from all castes. All of this tends to break down the age-old rigidity of the system. However, the fact remains that there are innumerable customs about diet, water-drinking, association with others, and marriage which are based upon the caste system and still have absolute power over the majority of Hindus.

Such a close-knit web of being for individual and society makes it impossible to disturb any of the fundamental elements in the Hindu system without upsetting the rest. That is, perhaps, why so little evidence of dissent has appeared through the ages, and it is also why even the most oppressed classes make the best of their lot, in accordance with the Hindu Dharma, since these social rigors have been determined by past lives and will be mitigated in future ones. It is easy to see why the Brahmin labored through the centuries to make this so; and the Kshatriya, providing warriors and government to the polity, had no reason to question his lot. The Vaisya division and, above all, the Sudra, might have provided the elements of rebellion against Hinduism at some point, but nothing of the kind has occurred on any scale because the integration of the whole was too successful: A man or group of men might wish to revolt against some particular aspect of the caste system or, indeed, against that system in its entirety, but it would be difficult for him to revolt against the general structure of Hinduism without being treated as insane. Too much is involved.

Much of the system revolts the western conscience; it seems unjust in the extreme. I have never felt easy about the caste system. However, it must be said that the system has, for many centuries, given Hindu society a stability it could never have attained by its secular organization or political structure, which were seldom good. The caste system differentiated Hindu society from all others and, in fact, maintained it through long ages of political chaos when a lapse into barbarism would otherwise have been inevitable.

Superficially, it would seem that India, with all her poverty, would be a fertile ground for communism. The truth is different. If the communist vision is the vision of man without God, if it is the vision of man's mind displacing God as the creative intelligence of the world, then communism will have no appeal to the Hindu mind. The Hindu feels in his soul reverence and awe for life and the world. His mind is not tirelessly seeking "a reason to live and a reason to die". His basic beliefs, not the Point IV Program, will act as a deterrent to the spread of communism in India. I must add that there can be nothing but gratitude in the heart of every Indian for the Point IV Program. However, the magnitude of the problem is great and the Indians must find ways to develop their resources and accommodate themselves within their resources without being a burden to the economy of the U.S.A.

I do not wish to get bogged down in the details of these economic problems existing in India. I shall avoid them altogether. I would, however, comment on the problem of birth control and "overpopulation", and on the wisdom of instituting public health measures. Of infectious diseases, the four main ones are malaria, cholera, typhoid, and smallpox. About 100,000,000 persons in India are afflicted with malaria, 2,000,000 of whom die each year. Cholera kills about 150,000 persons each year. Typhoid and smallpox also take heavy toll. These deaths are easily preventable, and I am strongly in favor of instituting public health means to prevent them.

Birth control is a cause which faces obstacles in India, although in some ways its many Indian supporters face less specific opposition than do its American advocates. India has no laws like those of Connecticut and Massachusetts, forbidding doctors to disseminate birth-control information as needed. Poverty and ignorance, and the difficulty of obtaining proper instruction and the necessary materials, are the most serious obstacles to a birth-control program. It should be realized, however, that overpopulation is not the whole problem. India's population has actually been increasing at a slower rate than in such countries as England and Holland, whose peoples have almost doubled in the past fifty years. The relative density of the population per square mile in the Netherlands is three times as great as in India; with the United Kingdom the ratio is two to one. The colonial policy had a direct and devastating effect on India's

No. 37 in a series of Staff photographs
Mr. Edmund R. Mattos, Assistant Director

population problem: With the artificial retardation of her industry under British rule, millions of craftsmen were thrown back on the land, with agriculture as their sole occupation. With independence, the Government hopes for a rapid building up of Indian industry, so that much of the surplus population can be drawn off the overcrowded land into new industries, while irrigation projects and scientific agriculture will increase the yield of the land. Yet the realities of an expanding population do confront India, although nothing in the Hindu religion specifically forbids the practice of contraception.

While talking to the Distaff Club a few months ago, I noted a lot of interest in the way Indian marriages are arranged. The arranging of marriages for their children is done solely by parents. Consent of the bride and the bridegroom is not sought. Higher authorities—stars in the case of Hindus—are consulted. Astrologers compare the horoscopes, and after the groom's family and the bride's family have agreed the stars will often disagree. Search must then be continued further for a candidate with a suitable horoscope. Husband and wife meet as complete strangers after marriage. I have found little enthusiasm for such a marriage among my friends. I am not sure I will abide by this system *in toto*.

The matter of Nirvikalpa Samadhi—abstraction of the spirit from the body in union with the Brahma—is a puzzle to western minds. It is not uncommon for some "holy men" to stay in a "cataleptic trance" for months and years without food, remaining in one rigid posture. Burial ceremony is not uncommon in India. These men practise breath-holding rigorously, day after day for years. They usually go to a lonely riverside and sit in a rigid posture, legs crossed, trunk straight, absolutely motionless, from midnight till dawn, night after night for five, ten, or fifteen years. Then they are ready for burial. A hole is dug in the ground about six feet deep. They sit in the hole in their usual Samadhi posture. The earth is put back into the hole and the ground is made level. According to capacity, they stay there for a day, a week, or sometimes a month. At the time of burial, they expressly state that they must be taken out on a given date, at a given time. Julian Huxley was much impressed by this feat of breath-holding and urged American physiologists to go to India to study respiratory physiology on these people.

I have tried to put down in a bald, though clumsy, manner the governing motives of the Indian mind. The western mind is obstinate, and has hitherto encountered transcendentalism only in a few individuals such as Emerson, Schopenhauer, and the like. It refuses to admit the extent and complexity of this phenomenon. One's pity for the mind that can be so smug in its insularity is tempered by the reflection that most of us are the same.

Madan M. Singh, M.D.,
Assistant Resident in Medicine

New addresses:—

- Lt. Irving P. Ackerman, MC, USNR (*M.* 1951), U. S. Naval School of Aviation Medicine, U. S. Naval Air Station, Pensacola, Fla.
- Dr. Crawford S. Brown (a.r.p. *D.* 1952), 1677 31st St., N. W., Washington, D. C.
- Dr. John F. Hogan (*M.* 1949 & *C.M.* 1950), Davidson County Health Dept., County Court House, Nashville 3, Tenn.
- Dr. James H. Kelleher (clin. a. *U.*), 57 Jackson St., Lawrence, Mass.
- Dr. Charles S. Keuper (r.p. *D.* 1951), 713 Herder Ave., Schulenburg, Tex.
- Dr. Robert P. Smith (*M.* 1943), 195 South Union St., Burlington, Vt.
- Dr. Clarence A. Splithoff (*Or.* 1942), 3406 Webster St., Oakland 9, Calif.

Brief bits:—

- Dr. Mary A. B. Brazier, Neurophysiologist in our Psychiatry, Anesthesia, and Neurology Departments, was recently invited to make a tour of four research centers in the Middle West: at Washington University in St. Louis, at the University of Iowa in Iowa City, at the Mayo Clinic in Rochester, and at the Illinois Neurological Institute in Chicago. During her visit she was guest speaker at the St. Louis Society of Neurology and Psychiatry, and in the Department of Ophthalmology at the University of Iowa.
- Dr. Nathaniel W. Faxon, our Director *Emeritus,* has been asked by the new board of managers of Danbury Hospital to make a survey of the problems and policies of the hospital.
- Dr. and Mrs. Jack Graham, Assistant in Surgery, with their two children, Michael and Susan, sailed on the *United States* for a four-months' stay at the Radiumhemmet in Stockholm, where they will study with Dr. Hans L. Kottmeier. They had a rather rough voyage, Susan being the only one of the family who was not seasick. At the advanced age of six, Susan attended the Captain's dinner all alone. Michael has been enrolled in a Swedish school and feels quite important, since he is helping out in the teaching of English with an older group of boys.
- Dr. Henry H. W. Miles, past Assistant in Psychiatry at M.G.H., read a paper recently at a Psychosomatic Forum of the American Psychosomatic Society in New Orleans. Its title was "Psychologic and somatic factors in coronary artery disease", by Dr. Miles, Samuel Waldfogel, Ph.D., Edna S. Barrabee, M.S., and Stanley Cobb, M.D.
- Dr. William A. Reilly (*C.M.* 1928), is Director of the Radioisotope Unit at the Veterans Administration Hospital, 42d Ave. and Clement St., San Francisco 21, Calif.
- Dr. Alfred Yankauer (*C.M.* 1941) has moved to Albany, where he will assume his new responsibilities as Director of Maternal and Child Health Services for the New York State Health Department. His address is 39 Columbia St., Albany, N. Y.

THE NEWS

No. 120 Boston, Mass. February 1953

DEPARTMENT OF RADIOLOGY

During the past year the activities of the Department of Radiology have covered not only the normal routines required in a large hospital, but have increased in their scope. In this atomic age in which we live, the Department plays an important and growing role, and the Staff has kept abreast of the scientific advances and at the same time maintained a top program of diagnostic and therapeutic radiology, of resident and technical training, and of teaching.

Achievement of even a modicum of success in these endeavors depends upon innumerable factors, but especially upon the efficiency of departmental personnel. Certain changes in personnel have occurred, and the filling of vacancies has not been easy.

In March 1952, Dr. William R. Eyler left us to go into the field of private practice in Chicago. During the time he was with us he contributed greatly to the scientific as well as the active clinical work of the Department. As of September 1, 1952, Dr. James J. McCort left Boston to practise in San Jose, California. He, too, had been a valuable investigator along clinical lines, especially in clarifying the roentgen anatomy of portions of the lymphatic system. It was with real regret that we accepted the resignation of both these men.

We believe ourselves fortunate, however, in their successors. For the coming year we have secured for the General Hospital the services of Dr. William D. Nichol, a native of New Zealand, who had his training in radiology with Dr. Peter Kerley in London, England. Dr. Nichol is an outstanding diagnostic radiologist and has been loaned to us by St. Bartholomew's Hospital, London, for the year. He has contributed many interesting facts regarding the type of training available in Britain. Since September we have had in the Baker Memorial Dr. John Gibbons, who received his radiologic training at the University of Pennsylvania, and who has already proved his value to the Department.

On the first of January, 1953, Dr. C. C. Wang was promoted to the Active Staff, at the completion of his resident training program. We are indeed glad to have him continue his work with us.

Early in 1952, Mrs. Cecile Smith resigned as chief diagnostic technician at the General Hospital and was replaced by Miss Felicia A. Strympek. Miss Strympek, in association with Mr. Oliver E. Merrill, has been particularly interested in the organization of an adequate teaching program for student technicians. Her plans include closer personal supervision of students than heretofore; and making a good lecture and reading course available to them, as well as continuing the former excellent practical approach to radiology. Miss Strympek also has brought in outside interests, having obtained the help of some of the large companies which provide technical assistance in the field of teaching.

In a closely-knit department such as that of radiology, there are many people who carry out extremely important activities and who seem to receive little credit for the work they do. Without the technical staff, the doctors could not handle the large load that is carried in routine diagnostic and therapeutic procedures in the Department. Important contributions in the daily care of the patients have been made by all our technicians—notably those holding important positions, such as Miss Annie Lynch, Miss Altheda Leith, Mrs. Dorothy Barr, and Miss Maretta McCleave.

The secretarial branch of our personnel is another which seldom receives any special mention, yet whose services are vital and are deeply appreciated by the Staff. A mistake on the part of a secretary may be as serious as one on the part of a technician. Upon the secretaries we rely for accurate transmission of the information that is obtained from the examination. There have been numerous changes in the secretarial staff, due largely to the better financial opportunities outside a hospital. We have been fortunate, however, in keeping key individuals—Miss Kathleen Galvin, Mrs. Mildred Burns, and Miss Ruth Bassett, and the work has continued on its uniformly efficient level despite the many difficulties occasioned by a too-frequent change of assistants.

Improvement in the filing methods, under the supervision of Miss Ethel Look, has been marked. At the Baker Memorial, Miss Helen Zingarelli has continued her exceptionally good work.

There are others, too numerous to mention, to whom the Department is greatly indebted for loyal, conscientious service over a period of many years. One of those who has been most faithful and yet least known is Miss Madge McCallion.

An innovation in the resident training program has been provided this year. An arrangement was made with the Oak Ridge Institute of Nuclear Studies whereby Dr. Wilma Canada spent the month of August there, taking a basic course in radioisotope techniques. This was followed by a three-months' residency in the Oak Ridge Institute of Nuclear Studies Hospital (ORINS Hospital), where numerous unusual cases of varying types of malignancy are studied and treated by means of isotope therapy. Following Dr. Canada's return to the Massachusetts General Hospital, the ORINS residency is being filled for three months by another of our residents—Dr. Martin Levene.

The activities of that portion of the Department which is primarily interested in radiation therapy have been largely directed toward caring for an ever-increasing number of patients. The majority of these patients suffer from malignant disease, and they are treated with x-radiation, radium, or some radioactive isotope. This work is carried out in close association with other departments in the Hospital, chiefly with the Tumor Clinic.

During the past year Dr. Anne O'Donnell has assisted in the Therapy Department, and her help is proving most valuable.

The use of our second supervoltage generator of two-million-volt capacity continues, and in the past year an active program of rotation therapy, utilizing this unit, has been instituted. We have acquired thirty more needles of special design, loaded with cobalt^{60}. These needles are primarily of value for treatment of cancer in the lymph nodes of the neck. Another innovation during the past year has been the employment of radioactive colloidal gold in the treatment of uncontrolled ascites and pleural effusion when due to malignant disease. The use of this isotope, like strontium^{90} and cobalt^{60}, has become an integral part of the therapeutic program.

The employment of beta rays in the treatment of benign conditions of the conjunctiva and cornea has been carried out on a clinical level. In addition, a program of more fundamental inquiry into the effect of beta radiation on the cornea and conjunctiva is being initiated by Dr. Wang and Dr. Milford Schulz, in association with Dr. William Stone, Jr. of the Eye and Ear Infirmary.

An investigation, undertaken by Dr. Paul St. Aubin and Dr. Schulz in an attempt to elucidate the basic factors of radiation necrosis of bone, has been under way during the past year. Many rabbits have been irradiated—the laboratory facilities which the study requires having been generously supplied by Dr. Joseph Aub. The experimental animals have received doses within the bone which varied from 1000-3000 r and reached as high as 6000 r. The final results, including various roentgenographic studies, are to deal with the uptake of calcium^{45}, the phosphatase activity, and, if possible, radiographs of thin sections of undecalcified bone, in order to show the distribution of calcium^{45}.

In addition to irradiation experiments conducted by our own Staff, many animals have been irradiated in varying numbers and at varying intervals for investigative programs being carried out by numerous other services in the Hospital.

The problem of improving the results of treatment in carcinoma of the cervix has continued as a chief interest. Modifications in methods of treatment, by means of both radium and x-ray, are being explored by the Department of Radiology and also by the Gynecologic Service. Dr. Schulz is planning to spend the next few months in Stockholm and in other European cancer clinics, in order to observe methods and results of treatment with radium of carcinoma of the cervix and other forms of malignancy.

During the past year a considerable number of studies have been carried out in the Department, some of which have been or are to be published. Dr. Stanley Wyman and Dr. Laurence L. Robbins presented a paper at the annual meeting of the American Roentgen Ray Society in Houston, Texas, on "The roentgen demonstration of parathyroid adenoma"; this was accompanied by a scientific exhibit. The exhibit received the silver medal of the American Roentgen Ray Society, which was their highest award given this year.

At the meeting of the Radiological Society of North America, held in Cincinnati last December, Dr. George W. Holmes, past Acting Chief of Radiology and now Honorary Physician at M.G.H., gave the first historical lecture the Society has had on its annual program. Dr. Holmes's subject was "The Life of Walter Cannon". Dr. Cannon, who served as Consultant in Physiology at McLean Hospital, was one of the early and outstanding contributors in the field of radiology. The choice of Dr. Holmes for this presentation reflects honor upon him and upon our Department.

Dr. Wyman reports that the use of the Radiological Research Room has been increased during the past twelve months. Over and above the work which is being done with the cardiologists, there is a large amount of investigation going on with other services. In association with the Urologic Service, lumbar aortograms are being made to reveal renal vascular structures in both patients and experimental animals.

The Rapid Cassette Changer has proved to be an exceptionally serviceable device. It is used in a multitude of peripheral vascular problems to which it is applicable. The study of heart disease and certain allied problems by angiography and aortography, and neuromedical and neurosurgical investigations are being carried out as they have been in the past. Currently, the diagnosis of coarctation of the aorta as manifested on plain films is being studied, on the basis of the findings from angiocardiographic examinations of patients with this anomaly.

In association with Dr. Oliver Cope, Dr. Benjamin Castleman, and others, Dr. Wyman and Dr. Robbins are making a study of the entire problem of the manifestations of hyperparathyroidism.

A monograph on slipped capital femoral epiphysis by Drs. Armin Klein, Robert Joplin, John Reidy, and Joseph Hanelin is now in press, and in the January 1953 issue of the *Journal of Bone and Joint Surgery* a paper by the same authors on the treatment of the contralateral hip in slipped capital femoral epiphysis is to be published.

Dr. Hanelin and Dr. Schulz are collaborating in a clinical investigation into changes in renal morphology and function following heavy irradiation of the abdomen in patients with testicular and retroperitoneal tumors. It is hoped that supplemental animal experiments may be possible.

Dr. Wang and Dr. Schulz have been investigating the advantages of radiation therapy in Ewing's tumor.

Dr. Canada expects to work with Dr. Gordon Brownell, exploring the possibility of using a soft gamma emitting point source of a radioactive isotope for diagnostic procedures.

Other proposed investigations include the study of amyloidosis and its manifestations, and of intestinal vascular disturbance.

The clinical facilities, as well as the scientific inquiries to be found in this Hospital, and as they are affected by the ever-increasing use of radiation in various forms throughout the world, present a valued challenge to the Department of Radiology. It is hoped that we may continue to meet this challenge.

Laurence L. Robbins, M.D.,
Chief of Service

At the meeting of the Radiological Society of North America, held in Cincinnati last December, a dinner was given for Dr. George H. Holmes by graduates and other affiliates of our Department of Radiology who attended the meeting. These included Dr. Alexander S. Macmillan, Dr. Aubrey O. Hampton, Dr. Maurice Robinson, Dr. Hubert A. Shaffer, Col. J. A. Isherwood, Dr. William Shehadi, Dr. Walter Brown, Dr. Phillip Batchelder, Dr. Richard Batt, Dr. Clayton H. Hale, Dr. William R. Eyler, Col. Harold A. Vinson, Dr. John D. Reeves, Dr. Leslie K. Sycamore, Dr. Benjamin Schneider, Dr. Jack Spencer, Dr. Peter Mueller, Dr. Milford Schulz, Mr. R. S. Quick, Col. Frank Y. Leaver, and Dr. Laurence L. Robbins. Other guests included Mr. Frank Scholz, Dr. Wallace C. Miller, Mr. Edgar H. Patterson, and Dr. George M. Wyatt.

Dr. Holmes entertained with numerous humorous stories, and also provided the group with his usual common-sense suggestions.

The toastmaster of the dinner was Dr. Aubrey O. Hampton, former Chief of our Radiology Department.

* * *

The following communication has been received from the Public Relations Division of the New York Academy of Sciences:

> It will interest you to know that Walter Bauer, M.D. . . . was among the forty-nine distinguished scientists who were elected to Fellowship in The New York Academy of Sciences at its Annual Meeting held on December 4. . . .
>
> Each candidate for this honor was nominated to Fellowship by the Council of the Academy from among the current 7,178 active and sustaining members of the Academy, in recognition of his outstanding scientific achievements.
>
> The New York Academy of Sciences, organized in 1817, is the fourth oldest scientific society in the United States, and its present membership is located in all forty-eight States, the District of Columbia, and forty-seven foreign countries.

The Board of Trustees, at their meeting on December 12, 1952, voted to appoint:

Lt. Leland C. Brannon, MC, USN, as Second Assistant Resident in Neurosurgery, for six months, beginning January 1;
Dr. Samuel Brendler as Senior Resident on the Neurosurgical Service, for six months, beginning January 1;
Dr. Frederic B. Mayo as Clinical Associate in Medicine, effective December 1, 1952;
Dr. Peter E. Sifneos as Assistant in Psychiatry, beginning January 1;
Dr. Earl M. Wedrow as Assistant Resident in Psychiatry, beginning January 1;
Dr. Frederick E. Whiskin as Resident in Psychiatry, beginning July 1.

The Trustees also voted to change Dr. Fritz Lipmann's title from Research Chemist to Biochemist.

At an earlier meeting, the Trustees voted to appoint Dr. Francis L. A. deMarneffe as Assistant in Psychiatry at the McLean Hospital, beginning January 1.

At their meetings held on December 10, 17, 24, and 31, the General Executive Committee voted:

To promote:

Dr. Clare Marshall from the position of Assistant Resident to that of Resident in Neurology for one year, beginning July 1.

To continue the appointments of:

Dr. John S. Bray as Clinical Fellow in Medicine, from October 1, 1952 through June 30, 1953;
Dr. John G. Freymann as Clinical and Research Fellow in Medicine, from November 1, 1952, in order that he may continue with the Huntington Memorial Laboratory group.

To reappoint:

Dr. Carl F. Essig, Jr. as Clinical Fellow in Neurology for one year, beginning January 1;
Dr. Si-Chun Ming as Second Assistant Resident in Pathology, beginning January 1.

To appoint:

Dr. Joseph Hofman as Clinical and Research Fellow in Surgery, for the period October 1, 1952 through June 30, 1953 (a late report of an October vote);
Dr. John D. Leidholt as Clinical Assistant in Orthopedic Surgery, beginning January 1;
Dr. William MacM. Lougheed as Clinical and Research Fellow in Neurosurgery, for one year;
Dr. Morten Smith-Petersen as Clinical Assistant in Orthopedic Surgery, beginning January 1;

Dr. Charles W. Wahl as Clinical Assistant in Psychiatry for one year, beginning January 1;

Dr. Oliver M. Wrong as Clinical and Research Fellow in Medicine, for one year.

To change the titles of:

Dr. Alice Bessman from Research Fellow to that of Clinical and Research Fellow on the Children's Medical Service;

Dr. Joachim S. Gravenstein from Fellow in Anesthesia to that of Clinical Fellow in Anesthesia, effective as of December 1, 1952.

The General Executive Committee also voted:

That the appointment of Dr. Elizabeth A. Koppel as Assistant Resident in Anesthesia be effective March 1, 1953 instead of January 1, 1952;

That Dr. Remedios K. Rosales be allowed to act as Assistant Resident in Neurology, for the period January 1 through June 30.

THE CARDIAC WORK CLASSIFICATION UNIT

A new stepchild of the Massachusetts General Hospital has come into being this fall with the opening of the Cardiac Work Classification Unit at the Bay State Rehabilitation Clinic. This Unit has long been a goal of the Massachusetts Heart Association and of the Division of Rehabilitation of the Commonwealth of Massachusetts Department of Education. The Division of Chronic Diseases of the Department of Public Health has also been an interested supporter.

The Rehabilitation Clinic has agreed to furnish quarters and administration for this cooperative venture. Dr. Dean A. Clark has been most cooperative during the period of organization in assisting in various ways. By special arrangement, X-ray work for the Clinic is carried on in cooperation with the Radiology Department of the Massachusetts General Hospital, and technicians from the Baker Memorial Hospital Laboratory furnish assistance after their regular hours. Miss Josephine C. Barbour has been most helpful with advice regarding social service matters and personnel.

With general agreement of the various organizations interested, an Executive Committee for the Unit has been set up, consisting of Drs. Augustus Thorndike, Howard B. Sprague, and Arthur L. Watkins, and Messrs. Edgar A. Perry and Theodore Chase. An Advisory Board includes Drs. Edward F. Bland, Mandel E. Cohen, M. Henry Clifford, and Paul D. White of the staff of this Hospital. Dr. Richard J. Clark has been appointed as Director of the Unit and Dr. James H. Currens as Assisting Director, both being members of the Massachusetts General Hospital staff and Cardiac Department. Dr. George E. Altman of the Beth Israel Hospital is also working as a Unit Cardiologist.

The purposes of the Unit are threefold: First, to furnish service to referred patients in the matter of evaluating them for proper placement in jobs in industry, relocating them to more suitable jobs within their own industry, or recommending them for vocational rehabilitation training through the State Department of Education. Second, the Unit aims to study further and enter into research regarding the total problem of matching cardiac patients to suitable work. Third—and most important—is the matter of education of patients, their families, physicians in general, and industrialists, as to the potentialities of various cardiacs for work and self-support.

"What can this Unit accomplish that practitioners or present cardiac clinics are not already doing?" is the question most frequently asked. The very excellent answer to this, recently given by Dr. Herman K. Hellerstein, director of a similar unit in Cleveland, is to the effect that the internist who can devote some two or three hours to each patient, who is a good social worker and an experienced vocational counselor, could do the job himself. In other words, the accomplishments of this Unit depend upon teamwork for which most individuals and clinics are not organized or equipped. Considerable time is devoted to each patient by cardiologist, laboratory assistants, social worker, and vocational counselor. Following thorough evaluation by each, a staff conference considers all cases in detail, in an attempt to arrive at optimum recommendations which are then implemented by the social worker and vocational counselor, most often through the State Division of Vocational Rehabilitation. Here, there is an excellent opportunity for liaison, in that Mr. Louis M. Tracy, the vocational counselor for the Unit, is, also, the supervisor of the Boston office for the State program. All too often in our clinics there may be a lack of adequate correlation between doctor, social worker, and outside agencies attempting to place or adjust patients in employment, and the patient is left hanging in mid-air somewhere along the line. This, we believe, can be overcome through the methods of this Unit. Furthermore, adjustment of the cardiac to suitable work is the primary aim of the Unit and time does not have to be consumed in regulation of dietary or medicinal therapy. While it is most important to determine that all patients are under optimum therapy, the Clinic concerns itself with this matter secondarily only, making recommendations to referring physicians to whom patients are returned with full reports.

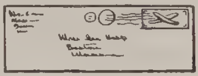
Interval follow-up visits are scheduled for all patients in order to observe the effect of work upon them and for reclassification where advisable.

It has early become evident that motivation, psychic factors, patients' fears, and lack of proper understanding of limitations and potentialities are all-important. Encouragement, explanation, reassurance, and even graduated work in one of the sheltered workshops to develop self-confidence, are essentials in this type of rehabilitation. The over-all evaluation of the patient in relation to his psychic and social environment is of far greater importance than specific exercise tolerance tests.

The services of the Unit are available to patients of any financial circumstance who have work problems related to cardiac disease. Referrals are by appointment only on recommendation of a physician. Patients pay whatever part of the cost they are able to afford. Financial deficits are met by the Massachusetts Heart Association.

Interested physicians are welcome as visitors at the Thursday evening conferences.

Richard J. Clark, M.D.,
Unit Medical Director



New addresses:—

Dr. N. Joel Ehrenkranz (*M.* 1950), George Williams Hooper Foundation, University of California Medical Centre, San Francisco 22, Calif. (until July 1).

Dr. Chester W. Fairlie, Jr. (*W.M.* 1942), 142 Steele Rd., West Hartford 7, Conn.

Lt. William F. Havemeyer, MC, USNR (a.r.s. 1948), U.S.S. *Consolation* (AH 15), c/o Fleet Post Office, San Francisco, Calif.

Dr. Falls B. Hershey (*E.S.* 1947), Dept. of Surgery, Washington School of Medicine, St. Louis 10, Mo.

Dr. Manucher Javid (r.s. *N.S.* 1952), University Hospitals, 13 University Ave., Madison, Wis.

Dr. John D. Leidholt (a.r.s. *Or.* 1952), 234 Marlborough St., Boston, Mass.

Dr. John L. McClung (*r.p. An.* 1952), 3102 Strawberry Lane, Port Huron, Mich.

Dr. James J. McCort (r.p. *R.* 1944), Santa Clara County Hospital, San Jose, Calif.

Dr. Isaac V. Manly (*E.S.* 1947), North Carolina Memorial Hospital, Chapel Hill, N. C.

Dr. Thip Pholpoke (gr. stud. a. *S.* 1952), Army Hospital, Bangkok, Thailand.

Dr. Morten Smith-Petersen (sr. r. s. *Or.* 1952), 266 Beacon St., Boston, Mass.

Dr. Lamar Soutter (a.r.s. 1941), 203 Commonwealth Ave., Boston, Mass.

Brief bits:—

Dr. Henry K. Beecher, Chief of our Anesthesia Service, presided, at the invitation of the Army, at a Conference on Artificial Respiration, held recently at the Army Chemical Center, Edgewood, Md.

Dr. Clemens E. Benda, Assistant in Psychiatry on our Staff, has been invited by the Minister of Public Health of the Government of Uruguay for a two-weeks' lecture tour in that country during the first part of February. Dr. Benda will give a series of lectures and hold conferences in hospitals and with scientific societies dealing with practical case work on cerebral palsy, Mongolism, and allied pediatric neuropsychiatric subjects.

Dr. William S. Clark, Assistant Physician at M.G.H., resigned as of December 31, 1952, to join the faculty of the Western Reserve Medical School as an Assistant Professor in Medicine. He will be director of the newly established Arthritis Study Unit at the University Hospitals in Cleveland, Ohio. This message from Dr. Walter Bauer, Chief of our Medical Services, includes the following: "Those of us who have known Dr. Clark since his arrival at the M.G.H. in 1945 will miss him greatly. We wish him every success in his new undertaking." Dr. Evan Calkins, who finished his year of service as Chief Resident Physician on December 31, will remain at M.G.H., taking Dr. Clark's position in the Robert W. Lovett Memorial Arthritis Study Unit.

Dr. Sylvester B. Kelley, Associate Visiting Urologist on our Staff, won the 1952 George Hamilton Prize for best parking in the Parkman Street lot. Congratulations, Dr. Kelley!

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. David G. Cogan, Director of the Howe Laboratory and Associate Surgeon in Ophthalmology, will fly to Cairo, Egypt, to take part in an Ophthalmological Congress which opens in Cairo on February 16. The Congress is being held in cooperation with the Golden Jubilee Meeting of the Egyptian Ophthalmological Society.

A visiting group of six guest lecturers, ophthalmologists from Europe and America, have been invited to address the Congress. At the request of the Egyptian Ministry of Health, this group is being sponsored by the World Health Organization of the United Nations. From the United States there will be Dr. Cogan, and Dr. Phillips Thygeson of San Francisco. The other special speakers will be Dr. Karl Lindner of Vienna, Dr. T. Keith Lyle of London, Dr. Rudolf Theil of Frankfurt, and another speaker to be announced.

Dr. Cogan will deliver three lectures —"Ocular dysmetria, flutter-like oscillations, and opsoclonus", "Radiation effects on the eye", and "Corneal physiology". Following the formal meetings of the Congress, seminars will be held over a ten-day period on various subjects of ophthalmological interest. This period will afford an opportunity for informal exchange of information and experiences.

Members of the Ophthalmological Section of the Brooklyn-Long Island Chapter of the American College of Surgeons spent a morning at the Infirmary on January 17. The visiting doctors went first to the Eye Operating Room galleries to observe surgery. Later, there were brief talks by Dr. Charles L. Schepens and Dr. Taylor R. Smith on the work of the Retina Service, and by Dr. Robert R. Trotter of the Howe Laboratory on "The early diagnosis of glaucoma".

A new service, known as the Hospital Dispatch Service, was activated at M.G.H. the first of the year. The reasons for its creation and the functions of this service are best explained in a letter sent on December 18 by Mr. Henry J. Murphy, Assistant Director, to all department heads at the Hospital. Mr. Murphy's letter reads:

> For many years it has been an M.G.H. practice to establish intrahospital transportation facilities within the various units. One of the most effective of these transportation groups has been the Nursing Auxiliary Service, located in the Bulfinch Building. This service, manned by a combination of volunteer and paid personnel, makes a very substantial contribution to the hospital effort.
>
> Because of the success of the N.A.S. and a belief by the Nursing Department that this type of organization could be most effective on a hospital-wide basis, a survey was instituted of all hospital transportation.
>
> This survey has been completed recently. Outlined below are a few of the conclusions drawn from the material gathered.
>
> 1. Many of the transportation groups are doing an excellent job within the areas in which they are permitted to work.
> 2. There is a hospital-wide need for more coordination between the transportation services.
> 3. There is also a need for more planning and understanding between the origin of the service and the recipients.
> 4. The Lampson Tube System could be used more effectively.
> 5. Personnel in general need to be made aware of the importance of the part played by the transportation services in the total hospital picture.
>
> As a result of this study, it was decided to establish a department that would be responsible for all intrahospital transportation. In its initial stage service will be limited to those areas which are currently providing their own transportation service. Once the initial period of trial and error is overcome, service will be extended to other areas where the need is apparent.
>
> This service is to be known as the Hospital Dispatch Service. Funds will be made available by transfer from those services to be incorporated. They are: Baker Information Messengers, White Information Messengers, Baker X-ray Messengers, White X-ray Messengers, Nursing Auxiliary Service, and Baker Messenger Service.

The Hospital Dispatch Service is based just outside the Moseley Rotunda. Juliet Vennard is Head of the Service. With its activation, the Nursing Auxiliary Service was discontinued, and Mrs. Acree of the past N.A.S. is now serving in the new H.D.S.

* * *

THE BACTERIOLOGY LABORATORY

On July 1, 1952, the Bacteriology Laboratory, which had previously been a part of the Department of Pathology, was set up as a separate Hospital department. At that time there were several changes in the personnel responsible for the laboratory. Dr. Louis L. Dienes, who had been in charge of the laboratory since 1930, retired and was appointed Consultant in Bacteriology to the Hospital. The Hospital is fortunate in that Dr. Dienes will continue to carry on his research work here. The undersigned, who is in charge of the Infectious Disease Research Laboratory of the Hospital, was appointed Chief of the Bacteriology Laboratory for an interim period. Dr. Lawrence John Kunz (Ph.D. in Medical Sciences from Harvard College, 1951) was brought from the Department of Bacteriology and Immunology of the Harvard Medical School and made Assistant Chief of the laboratory. Dr. Kunz, who is an instructor in the Bacteriology Department of the Medical School, will continue his teaching activities and will provide a closer tie between the Bacteriology Laboratory of the Hospital and the Bacteriology Department of the Medical School.

Since July 1952 several additions and replacements have been made in the laboratory technical staff. This group of technicians continues to profit from the guidance and experience of Miss Marguerite E. Burke, who supervises the laboratory work.

Though the main function of the laboratory is the provision of good bacteriologic and immunologic services to the Hospital, we are pleased to report that an old system is being reintroduced which will enable the laboratory to participate in the medical education of the house staff. House officers from the Pediatric and Medical Services are now spending a month working in the laboratory and have the opportunity to learn some practical and, perhaps, useful bacteriology. The laboratory personnel, of course, profit from the presence of these clinicians. The Pathology Department will continue to rotate its assistant residents through the Bacteriology Laboratory as it has done in the past.

Dr. Kunz, whose research activities combine immunology and virology, is engaged in the investigation of a phenomenon involving immune hemolysis and in an analysis of the antigenic components of the mumps virus.

Dr. Dienes continues his studies started several years ago on the pleuropneumonia group of organisms and the transformation of common bacteria into such forms. Attention is centered at present on the conditions of this transformation and on its eventual pathological significance.

My research interests lie mainly in the realm of microbial biochemistry, and work is currently going on with regard to the pathogenesis of secondary infections in patients receiving chemotherapeutic agents, and the modes of action of antibiotics.

Members of the house staff and others are invited to discuss problems of mutual interest with the members of the Department of Bacteriology.

Thomas F. Paine, Jr., M.D.,
Chief of Bacteriology

COORDINATING COMMITTEE

The first meeting of the Coordinating Committee was held on January 30, 1952, and since that time Dr. Clark has called four other meetings, at all of which he has presided.

The purpose of the Coordinating Committee is to utilize the combined thinking of the eight volunteer groups which make such invaluable contributions to the proficiency of the Hospital. Under this plan each organization, while maintaining its own identity, is better equipped to contribute to the many special projects of common interest. The plan also gives the administrative branch of the Hospital and the representatives from the volunteer groups opportunities to talk over problems of mutual concern.

Furthermore, informal luncheon meetings furnish additional opportunities for each group to become better acquainted with the activities of all the other groups and to plan for even greater cooperation in the future.

The members of the Coordinating Committee are concerned with certain problems which affect the M.G.H. and other institutions associated with it: questions pertaining to legislative matters, Civil Defense, hospitality, the philosophy behind fund raising, ways of recruiting volunteers, decorating projects, and similar undertakings.

At these meetings Dr. Clark has answered questions on such subjects as the ten-year plan for M.G.H., parking problems, the Minimum Wage Bill, the Hospital deficit, the Emergency Defense Committee at M.G.H., Blue Cross and Blue Shield payments to the Hospital, various building projects of the Hospital, as well as the many extramural activities of the Staff. As a member of the President's Commission on the Health Needs of the Nation, Dr. Clark has also described the work of this Commission.

VOLUNTEER GROUPS

Distaff Club

The January meeting of the Distaff Club was held on the 22d, at 8 P.M., in the Penthouse. Election of officers for the coming year was held. Hostesses for the meeting were Virginia (Mrs. Evan) Calkins and Pat (Mrs. Hugh R.) Dudley.

Ladies' Visiting Committee
Massachusetts General Hospital

At the 83d annual meeting of the Ladies' Visiting Committee of the Massachusetts General Hospital, held on Thursday, January 8, Dr. Clark presented a fifty-year MGH service pin to Mrs. Richard W. Hale. Aside from Mrs. Hale's great interest in the Ladies' Visiting Committee over these many years, she has contributed extremely valuable work during the last decade in preparing surgical dressings for the Hospital.

Massachusetts General Hospital
Volunteer Service Department

Besides the paid personnel of the Hospital, there were in 1952 approximately 465 Volunteers at the Massachusetts General Hospital who gave 42,938 hours of service. Twenty-eight of these Volunteers have served the Hospital for ten years or more; thirty of them for five years or more; and forty-eight Volunteers were given one-hundred-hour service pins during the past year.

These Volunteers work in almost every department and clinic in the Hospital, including the Nursing Department, the Blood Bank, Archives, Chaplain's Office, Credit Department, Fracture Office, Personnel Office, Post Office, Social Service, Occupational Therapy, Laboratories, Photographic Laboratory, Library Service, Linen Control, and in the preparation of supplies for the Operating Room.

Mrs. Francis E. Smith of Winchester, who has been a Volunteer in the Hospital for the past ten years, worked practically every day during the month of December helping to sort the thousands of letters and Christmas cards which flooded the MGH Post Office during the Christmas season. The rest of the year she works Mondays, Wednesdays, and Fridays in the Post Office and continues to give countless hours of Volunteer Service there.

Mrs. David E. Farrisey of Chestnut Hill was written up in a December issue of the *Boston Traveler* as the "Volunteer of the month". Her work at the M.G.H. has included the preparation of thousands of packages of sponges and rubber gloves for use in time of emergency; she engaged in the project of fingerprinting approximately 4000 people connected with the Hospital; she gave three days' service a week during the summer of 1951 in the Personnel Department; and she assembled and supervised the distribution, to the MGH staff, of the recently revised referral manual which ensures the continuance of patient care after discharge.

MGH Volunteers are also to be found in seventeen of the clinics in the Out-Patient Department. Mrs. Herbert Barry, Jr. is working under Miss Meenan as a "receptionist". This title hardly does justice to the important and useful work performed by this tireless Volunteer. Two mornings a week Mrs. Barry covers all the clinics on the second floor of the Out-Patient Department. She helps in many ways to keep patients happy: She explains the unavoidable wait when a record is delayed or an emergency detains the doctor; she brings coffee from the OPD lunch counter to patients who for one reason or another are unable to go for it themselves; she explains in simple terms the doctors' instructions; she offers magazines to those who must wait a considerable time; but, above all, her most important job is just letting a harassed patient talk to a sympathetic and understanding person who has the time to listen.

Mrs. Barry's work is part of a pilot plan which seems to be proving its worth. Probably the best proof of its value is that the personnel, nurses, secretaries, and others notice the difference on the days when Mrs. Barry is not here. Eventually, the O.P.D. hopes to have ten receptionists, and promises any Volunteer who can give one or more mornings each week a most interesting and rewarding experience for herself, as well as work which is of inestimable value to the Hospital.

Other new projects which the MGH Volunteer Department inaugurated in 1952 include the Book Cart Service in the Phillips House. Those working in the Phillips House Library Service are Miss Dorothy Bartol, Mrs. William F. Dean, and Mrs. Murray Lewis. The General Store Cart, another new project, is taken through the General wards by Miss Dorothy Bartol, Mrs. James Currens, Mrs. Virginia Hill, Mrs. Edith S. Kirkbride, Mrs. Wheaton Kittredge, Mrs. Richard Osborn, and Mrs. John S. Taylor.

Actually, Volunteers are drawn into almost every department of the Hospital. They help to alleviate the nursing shortage by their non-technical work in that department. They assist in many other departments, also, by relieving pressure not only on the Hospital workers but on the budget of the Hospital, as well.

Volunteers are always needed at the M.G.H.

MGH Volunteers who have worked 10 years or more: Mrs. Fuller Albright, Mr. William Barroll, Mrs. Herbert Barry, Miss Dorothy Bartol, Mrs. Serena R. Bentley, Mrs. Taylor Black, Mrs. Samuel S. Drury, Mrs. Nathaniel W. Faxon, Miss Ruth Agnes Fraser, Mrs. Francis C. Gray, Mrs. Richard W. Hale, Mrs. Arthur D. Hill, Mrs. E. W. Jenney, Miss Ethel Padden, Mrs. David Patterson, Mrs. Francis M. Rackemann, Miss Anna P. Revere, Miss Alice Ropes, Miss Marguerite Ryan, Mrs. Francis E. Smith, Mrs. A. L. Sneddon, Mrs. Martin E. Sullivan, Mrs. John S. Taylor, Mrs. Arthur Thiessen, Miss Elizabeth Townsend, Miss Ruth M. Waldron, Mrs. Conger Williams, Mrs. John O. Wilson.

MGH Volunteers who have worked 5 years or more: Mrs. George R. Alley, Mrs. Carl L. Billings, Mrs. F. D. Cadwallader, Mrs. Dora G. Daniels, Mrs. John L. Evans, Mrs. Edward M. Feeley, Miss Antoinette Freda, Miss Ruth Gile, Miss Adele R. Gruener, Mrs. J. R. Harding, Miss Mary C. Hardy, Mrs. Miles C. Higgins, Miss Blanche E. Houlahan, Mrs. Malleville McC. Howard, Mrs. James Irvine, Mrs. Paul Keene, Mrs. Herbert Kelley, Mrs. Carl J. Kesseli, Miss Margaret W. Kettell, Mrs. Allan Lewis, Mrs. A. S. Lucas, Mrs. Richard B. Neiley, Mrs. James A. Potter, Miss Kate Saunders, Mrs. Bonnie M. Sprague, Mrs. Percy F. Tibbetts, Mrs. Harold K. Veazie, Mrs. Guy Waring, Mrs. J. F. Wilber, Mrs. Fred G. Wilder.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs are listed each month in The News as a convenience for our readers. For that reason we ask you to send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers.

The following new titles have been received. Each title appears in a 1952 publication unless otherwise indicated. No further 1952 titles will be listed.

General Surgery

Scannell, J. G.
Medical progress: Thoracic surgery.
New England J. Med. 247:800-807, 843-850.

Scannell, J. G., Myers, G. S., and Friedlich, A. L.

No. 38 in a series of Staff photographs

Dr. Fred A. Simmons, Assistant Surgeon, Head of Fertility & Sterility Clinic

Significance of pulmonary hypertension in constrictive pericarditis: A pre- and post-operative study.
Surgery 32:184-194.

Waddell, W. R., and Burbank, C. B.
Cholangiojejunostomy (Longmire operation) for relief of biliary obstruction due to carcinoma.
New England J. Med. 247:929-932.

Waddell, W. R., and Wang, C. C.
Experimental studies in human gastric physiology—I. The effect of fat upon gastric evacuation after partial gastrectomy.
Ann. New York Acad. Sc. 56:83-92.

Neurology, Neurosurgery, and Psychiatry

Cobb, S.
Consciousness and cerebral localization.
Epilepsia, 3d series, vol. 1, Nov. 1952, no pagination.

Cobb, S., and Miles, H. H. W. (Editors)
Psychiatric conference: Migraine and character neurosis.
Am. Pract. & Digest Treat. 3:985-990.

Orthopedic Surgery

Reidy, J. A., Broderick, T. F., Jr., and Barr, J. S.
Tendon transplantations in the lower extremity: A review of end results in poliomyelitis. I. Tendon transplantations about the foot and ankle. II. Tendon transplantations at the knee.
J. Bone & Joint Surg. 34-A, No. 4:900-914.

Pediatrics

Corsa, L., Jr., Pugh, T. F., Ingalls, T. H., and Gordon, J. E.
Premature births as a problem of human populations.
Am. J. M. Sc. 224:343-360.

Urology

Colby, F. H.
Carcinoma of the bladder: Results of total cystectomy.
Canad. M. A. J. 66:144-147.

Books

Cannon, Ida M.
On the social frontier of medicine.
Cambridge, Harvard University Press.

Colby, F. H.
Essential urology, 2d edition revised.
Baltimore, The Williams and Wilkins Company, 1953.

Everyone who read that letter from Dr. Russell T. Congdon (*W.S.* 1909) which appeared in the March 1950 issue of The News will always remember it. Recently this brief, but just as cordial, note arrived from him:

> I am enclosing my check. I would miss The News very much.
>
> We are all well and busy. I have not forgotten the debt of gratitude I feel for the training I received under Drs. Mixter, Richardson, Cabot, and others.

This short letter has come from Dr. Hans J. Harder (a.r.p. *An.* 1952).

> You were so kind to send me a copy of The News because I was mentioned in it, and I thank you very much.
>
> I am still very interested in everything that happens in the "Old Mass. Gen. Hosp." because the Anesthesia Department gave me a wonderful time and a tremendous knowledge in my profession. Sometimes I am really homesick for Boston, especially now in the beautiful Christmas time.
>
> Could you be good enough to send me the monthly copies of The News? I am sure that one of my friends in Boston will subscribe for me. I will ask them within the next few weeks and will give you the information.

A letter with a new address has come from Lt. George B. Murphy, MC, USNR (*S.* 1952). From the USNS Gen. Leroy Eltinge TAP 154, c/o Fleet Post Office, New York, N. Y., he writes:

> I have sincerely enjoyed receiving my copies of The News. They have found their way here to the New York Port of Embarkation with facility, but to catch up with me now please change to the address above.
>
> At this point it looks as if I am going to see a lot of the world and very little of an operating room. However, I plan to just "relax and enjoy it".
>
> Warmest regards to all at the M.G.H.

From Dr. Laurens P. White (*M.* 1950), address 149 Castro Street, San Francisco, California, has come this note:

> Through devious channels I have been getting a copy of The News each month for some time, but would prefer to get it directly. Could you start sending it, and bill me?
>
> For 18 months I have been working at the Laboratory of Experimental Oncology, which is run by the Public Health Service and is a diverticulum of the University of California. In addition, my wife and I have been a last "port of call" for several MGH folk *en route* to Korea, the last two being Lee Cecil (*M.* 1950) and Lot Page (*M.* 1950).
>
> Our future plans are uncertain, so I can't give you anything dramatic for The News. We do hope to get back East before long, however.

We were delighted to receive even these few lines from Dr. Chiu-an Wang (*W.S.* 1944):

> This is just a brief note to inform you of the change of my office to 207 China Building, Hong Kong, China. I also wish to tell you that the Wang family has been well and has grown a bit—an addition to us of Ann, born July 8, 1952. Thus we have three daughters—one more to catch up with Dr. Clay and Dr. Linton!
>
> I have instructed my brother, Dr. C. C. Wang, to pay you for my subscription to The News. Kindly address it to this new office.
>
> Everything out here seems to be all right.

THE NEWS

No. 121 Boston, Mass. March 1953

REORIENTATION OF DERMATOLOGY

III. THE RESEARCH LABORATORY

With the reorganization of the Department of Dermatology in the Harvard Medical School and the Massachusetts General Hospital in 1948, foremost among the objectives was the development of a research laboratory. This was to be more than an amateur's attempt to learn something about the skin. It required men with the interest and scientific training, having a knowledge of the tools and methods of research, and possessing the ideas and ability to define the problems and undertake their solution.

Amazingly little is known of the dynamics in the function of the skin, although its anatomy has been the subject of study since Hebra introduced the ideas of Virchow in cellular pathology near the middle of the last century. Few thought of the skin as an organ or, if they thought of it as such, could define its cardinal function in terms of the total physiological system of which it was a part. The obvious is easily overlooked. That the skin serves as the body's great organ of protection seems hardly to have been recognized, so little were we concerned with its essential purpose.

The skin is the body's largest organ, accounting for about six percent of the body's mass. It is three times the size of the liver, if that is of any importance. Its spatial position is unique, for like no other organ except the eye it faces the world around us. It functions as a primary agency to insure the constancy of the internal environment without which mammalian life is impossible. It is the encompassing protector of homeostasis.

Man lives and moves in a world of varying heat and cold, of terrestrial solids, liquids, and gases, subjected to an almost chaotic variety of destructive forces. He lives also in an inward medium governed by circulating fluids which mediate between the shifting and perverse outer world of change and the inner stabilized world of constant temperature, of steady pH, and of orderly biochemical interactions.

The pre-eminent guardian of this inner equilibrium is the skin. And of the skin the epidermis, with its outward horny covering, is the most vital. Without the keratinous shield of the stratum corneum the body would lose its fluids, wither, and die.

The skin is a complex organ differing widely in its constituent parts. On the outward side, meeting the external environment, it is soft and vulnerable, yet here it offers stout protection to the vital functions of life. Without the narrow zone of epithelial cells, dead and hardened at the surface, life could not endure. This is the epidermis, which varies from about 0.1 to 0.2 millimeters in thickness. Only epithelial cells compose its substance. It is without blood vessels. For nourishment and the disposal of waste it depends upon the diffusion of fluids through the barrier lying between it and the supporting vascular understructures.

Lying uppermost on the stratified cells of the epidermis is a narrow zone of dead or dying epithelium, the horny layer or stratum corneum. So simply designed, the living epidermis exists that in the product of its continuous death the greater life of the body may be preserved.

It is the epidermis which has been occupying our attention in the laboratory. The epidermis with its vital function is wholly dependent for its survival upon the deeper structures of the dermis. Where the epidermis is tender and yielding, the dermis provides a tenacious and tough material of collagenous nature which gives support to the cutaneous envelope. Upon its outlying vascular elements, its secretory activity, and the horny epithelium of the epidermis, the regulation of bodily temperature is strongly dependent. Vasomotion and secretory activity of the cutaneous glands, and perhaps other functions not well defined or understood as they affect the integumentary system, are governed by the autonomic nervous system with its connection through the hypothalamus with the higher centers of the psyche, and through the humoral influences of the glands of internal secretion.

And not least, the dermis keeps the body aware of its surroundings through the sensory nerves with which it is generously endowed.

Not long ago a leading medical educator stated that prior to World War II there were no more than five persons with doctoral qualifications engaged in full-time dermatological research in the United States. When one considers the high incidence of medical problems arising from the skin or in which the skin participates, and how obvious and available for experimental study the skin happens to be, one would expect it to rank high among the subjects of medical research. The fact is, it ranks among the lowest.

The new research laboratory at the Massachusetts General Hospital was opened for work in January 1949. It may be of some historical interest that it came to occupy one of the oldest buildings making up the Hospital. This is Bradlee Ward E, once a surgical amphitheatre and wards, and later the wards of the Children's Medical Service. Over a period of six months preceding the opening of the laboratory a strange collection of rooms, large and small, holding much of interest for the collector of architectural and hospital antiquities, was transformed into modern research laboratories with an air-conditioned animal room. There are laboratories for biochemistry and histochemistry and for tissue culture and microbiology. In addition to these, the department supports a laboratory located at the Harvard Medical School. This works in close association with the laboratory of physical chemistry.

The original staff of two full-time research workers and two technicians has grown to include seven full-time research workers, two part-time workers, and seven technicians.

The central problem under investigation in the laboratory relates to the epidermis and its keratinous covering. A major part of the work is directed to a study of the chemistry of keratinization and the relation of the epidermis to the diffusion of water through the skin. Other than certain morphological changes to be observed in the maturing epidermal cells, very little is known of the mechanism by which keratin is formed and nothing as to the disturbance of the process in disease.

Errors in keratinization are perhaps the most frequent accompaniment of cutaneous disease, whether it arises from inflammation, metabolic inadequacies as in vitamin A deficiency, or in neoplastic processes. Biochemical and histochemical studies are in progress to determine the chemical transformations occurring within the epidermal cells which lead to the formation of keratin.

The keratinizing process is involved in the aging of the skin and also in the late reaction to ionizing radiation. Both conditions may be the precursor of carcinomatous disease in the skin. With a biochemical characterization of keratinization, it should be possible later to learn something of its pathogenic implications.

Related also to the same epidermal structures is an investigation of the diffusion of fluids through the skin and the loss of water under varying conditions of atmospheric humidity. This includes the location of the barrier to the loss of water and the problem of hydration of the keratinous surface. Already this has resulted in a better understanding of dry skin and the rationale of therapeutic measures directed toward the relief or prevention of surface dehydration. This problem is intimately connected with the effect of detergents on the skin.

The disruption of the horny layer of the epidermis has a bearing on the susceptibility to infection and the penetration of toxic substances which may produce disease far removed from the site of entry or contact with the pathogenic agent. In this connection a study was made on the action of various chemical agents on the bacterial flora of the skin. The apparent capacity of some to reduce quantitatively the resident bacterial population was found to result from changes in electrical charge between the skin and the bacterial cell which held the organisms more securely to the skin, the organisms being released under circumstances affecting the alteration of the charge on the cell. From this investigation an improved technique for degerming the skin was developed which is now being used as standard surgical procedure in this and other hospitals.

The phenomenon of vesiculation and blistering is a characteristic of the epidermis. A definition of the biochemical lesion resulting from exposure of the skin to the vesicating arsenical gases seemed good reason for further investigation of the mechanism of intermediate carbohydrate metabolism of the skin. Vesication in one form or another is one of the most frequent reactions of the skin in disease. It occurs as a reaction to chemical hypersensitivity and to infection. In the eczematous dermatoses of intrinsic origin, vesiculation, although of microscopic proportions, is chronic and recurring. And in pemphigus the phenomenon reaches its largest and most destructive proportions.

Related also to the epidermis is the process of neoplasia. Certain azo dyes and aromatic amines are potent sensitizing agents, which after repeated contact with the skin are carcinogenic. The effect of certain of these chemicals on embryonic skin of the chicken growing in tissue cultures has led to reproducible cellular changes, the nature of which is now under investigation as to their chemical identity and genetic significance.

A more practical application of the interest in epidermal sensitization has led to the identification of chemical agents employed in the fabrication of plastic adhesives which are responsible for contact allergic dermatitis. With this information it should be possible for the manufacturer to eliminate these substances from such articles as shoes and adhesive plaster. However, more study needs to be given to the mechanism responsible for reactions due to this cause.

Directly related to the patient has been a study of the plasma proteins in pemphigus by electrophoresis and a newer method of fractionation developed in part in one of the laboratories of the department. The lipoproteins in the diseases of lipid metabolism, some of which affect the skin, are at present under study.

Farther removed from the problems of the skin, yet well within the field of interest, has been a prolonged study of the factors influencing the localization of syphilitic disease. This is part of the general problem of the biology of syphilis which has occupied our attention for many years. It is not so much the problem of syphilis as a specific disease which intrigues us as it is the many aspects of an infectious disease characterized by recurrent episodes of activity, often quite dissimilar in localization and form, which occupy in their progression a very long passage of time. The natural history of a disease which unfolds itself from a reaction at the portal of entry of the infecting organism to a final climax of destructive proportions years later or to a gradual waning of the infection until it passes beyond clinical or even bacteriologic recognition is an object of wonderment.

A study of the course of infection early and late in its progression has yielded information regarding the presence of *Treponema pallidum* at the site of localization of active disease, but there remains an obscure period of latency lying between the beginning and the end in which the behavior of the infecting organism and the mechanism whereby the distant foci of disease, as in the cardiovascular system, are established and maintained is unknown. It was this obscure period in the life of the disease which has been investigated.

For the laboratory animal, at least, it was found that *Treponema pallidum* may inhabit the blood stream for prolonged periods of time in the absence of any evidence of tissue reaction or inconvenience to the animal, in some cases even to its death in old age or when the serological evidence of disease had vanished.

These are the problems which have interested the people working in the laboratory. They are but a few of the many avenues by which one could approach the unrevealed secrets of the skin. In no area are there so many unexplored recesses of knowledge.

Chester N. Frazier, M.D.,
Chief of Dermatology Service

This month will be climaxed by the sixty-first Annual Vincent Club Show, given for the benefit of the Vincent Memorial Hospital. Performances will be held at New England Mutual Hall, Wednesday through Saturday evenings, March 25 through 28, at 8:30, with a matinee Saturday afternoon at 2:30.

The new or Provisional Members of the Club have been working since the first of December to secure advertisements for the Vincent Show Program. As we go to press, they and the Advertising Committee have $24,000 worth of advertising contracts salted away.

Rehearsals for the Show are now going on daily. It promises to be quite different and very exciting this year. "Pass the salt, Mr. Jones" is an original musical comedy, written by Mrs. Richard M. Grandin and Mrs. Stearns Poor. It deals with the denizens of the deep—mermaids, Davy Jones, the lost island of Atlantis, atomic scientists, and a mysterious radioactive metal—not to mention jesters, dancers, singers, and the Vincent Drill.

Tickets will be on sale at New England Mutual Hall every day, Monday through Friday, beginning March 9, from 9:30 to 5, and on Saturdays from 9:30 to 1. Tickets range in price from $1.25 to $5. The box office telephone number is COpley 7-0180. Mrs. Edwin F. Cave is the chairman of the Ticket Committee.

* * *

Dr. Dean A. Clark, our General Director, has been appointed Clinical Professor of Preventive Medicine at the Harvard Medical School.

The Board of Trustees, at their meetings held on December 26, January 9 and 23, and February 4, voted:

To approve the location of the new Pathology Building between the Baker Memorial and Charles Street;

To create a new rank on the Active Staff to be known as "Consulting Visiting Surgeon" or "Consulting Physician", etc., in accordance with recommendations submitted by the ad hoc committee appointed February 7, 1952;

To grant leave of absence to Dr. Edward D. Churchill for January and February;

To accept with regret the resignation of Dr. William S. Clark as Assistant Physician, effective as of December 31, 1952;

To accept with regret the resignation of Dr. H. Bristol Nelson as Assistant Obstetrician, effective January 15;

To accept the resignation of Dr. Chiu-chen Wang from the position of Assistant Radiologist, effective January 1.

To appoint:

Dr. Morris H. Adler as Clinical Associate in Psychiatry;

Dr. Betty Q. Banker as Assistant Resident in Neuropathology, beginning July 1;

Dr. Evan Calkins as Assistant in Medicine, effective January 1;

Dr. Pierre M. Dreyfus as Assistant Resident in Neurology for one year, beginning July 1;

Dr. Parker Heath, Jr. as Assistant Resident in Medicine, beginning May 1;

Dr. Mark R. Knapp as Assistant Resident in Anesthesia, beginning November 15;

Dr. Louis W. Lewis as Assistant Resident in Anesthesia, for three months, beginning March 1;

Dr. Russell M. Nelson as First Assistant Resident on the Surgical Service, beginning April 1;

Dr. Joseph Stokes, III, as Resident in Medicine, beginning July 1;

Dr. Morton N. Swartz as Chief Resident in Medicine, beginning January 1.

At their meetings held on November 5, December 17 and 24, and during January, the General Executive Committee voted:

To promote the following men from

Interns to Assistant Residents in Medicine, beginning July 1:

Dr. John T. Binion
Dr. Beverly W. Cobbs, Jr.
Dr. Herschel D. Collins
Dr. William L. Morgan, Jr.
Dr. James A. Pittman, Jr.
Dr. Kenneth J. Ryan
Dr. John B. Thomas
Dr. Yang Wang

To promote the following men from Assistant Residents to Residents in Medicine, beginning July 1:

Dr. James B. Field
Dr. John H. Knowles

To continue the appointment of:

Dr. Robert M. O'Neal as Clinical Fellow in Pathology for one year, beginning July 1.

To appoint:

Dr. Morris E. Chafetz as Clinical and Research Fellow in Psychiatry;
Dr. N. Joel Ehrenkranz as Resident in Medicine for one year, beginning July 1;
Dr. Jonathan B. Gill as Clinical Assistant in Psychiatry, effective as of January 14;
Dr. Thomas H. Gilmore as Clinical Fellow in Psychiatry, for six months, beginning January 1;
Dr. Alfred E. King as Graduate Student Assistant in Surgery, for the period January 1 through March 5;
Dr. William R. Owen as Clinical Fellow in Medicine, for six months, beginning January 1;
Dr. William M. Tait as Clinical Fellow in Radiology, beginning July 1;
Dr. Chiu-chen Wang as Clinical Fellow in Radiology, beginning January 1.

In order that all Hospital personnel, professional and otherwise, may be informed of a certain procedure in effect here at M.G.H., we are including a copy of a letter sent out recently by Dr. Clark to all Department Heads. The letter reads:

> One of the duties of our archivist is to keep a record of the location in the Hospital of every item of historical significance concerning the Massachusetts General. Instances of the removal of items, with no notifications having been sent to the archivist, have resulted in most embarrassing situations, particularly when visitors from afar have come to the Hospital to see our collections. As an illustration: a portrait that had been hanging for years in the Medical Staff Room was found (quite by accident) to be missing, and much time was needlessly consumed before its new location was discovered—out at McLean Hospital.
>
> In order that our records mav be complete and correct, whenever an item is 1) added to our collection, 2) withdrawn from our possessions, or 3) moved to another location within the Hospital, notification of such procedure should immediately be sent by the person responsible for the addition, withdrawal, or change of location of the item, to Cora F. Holbrook, Archivist.
>
> I urge your cooperation in this matter.
>
> (Signed) Dean A. Clark, M.D.,
> *General Director*

New addresses:—

Dr. Richard T. Barton (*Otolar.* 1945), 9754 Wilshire Blvd., Beverly Hills, Calif.
Dr. Joseph L. Braudo (a.r.p. *C.M.* 1953), Department of Cardiology, Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. John F. Bresnahan (a. dir. 1918), 4670 Pine St., Omaha, Nebr.
Dr. Harrie R. Chamberlin (*C.M.* 1949), Department of Pediatrics, University of North Carolina School of Medicine, Chapel Hill, N. C.
Dr. Charles P. Gore (a.r.p. *Psychiat.* 1952), 1 Grosvenor Court, Grosvenor Hill, Wimbledon, London S.W. 19, England.
Dr. Edwin C. Hoodless (a.r.s. *Or.* 1952), St. Joseph's Hospital, Victoria, British Columbia, Canada.
Dr. Fred H. Howard (*C.M.* 1949), Department of Pediatrics, Tulane University School of Medicine, New Orleans, La.
Dr. William J. Kerr (*W.M.* 1916), Box B, Blue Lake, Humbolt County, Calif.
Dr. Sergio A. Leiseca (gr. stud. a. *S.* 1952), 29 Alpine St., Cambridge, Mass.
Dr. H. Eugene Patterson (a.r.p. *C.M.* 1952), 1111 W. Yakima Ave., Yakima, Wash.
Dr. Walter A. Reif (fel. *An.* 1952), 11 Hoeheweg, Bern, Switzerland.
Dr. Horace P. Stevens (*W.S.* 1907), 985 Memorial Drive, Cambridge, Mass.
Dr. Laurence D. Trevett (a.r.p. 1933 & r.p. *N.* 1934), 274 Commonwealth Ave., Boston, Mass.

Brief bits:—

Dr. Joseph C. Aub and Dr. John E. Gordon, both of our Staff, are members of an international team of 15 leading medical men sent on a teaching mission to India. The mission is sponsored jointly by the United Nations World Health Organization and the Unitarian Service Committee.

Dr. Benjamin Castleman, Acting Chief of Pathology at M.G.H., is going to Guatemala in March and to England in August. We hope to have details concerning these trips later.

Dr. Earle M. Chapman, Associate Physician at the Hospital, went to Steubenville, Ohio, on February 10, to deliver a lecture on "Industrial diseases as seen by an internist".

Dr. Fletcher H. Colby, Chief of our Urology Service, was elected Secretary and Treasurer of the Clinical Society of Genito-Urinary Surgeons, at their annual meeting, held in Rochester, N. Y., in February.

Dr. John F. Gibbons, Assistant Radiologist on our Staff, has been appointed as diplomate of the American Board of Radiology.

Dr. Benson B. Roe (*W.S.* 1943) announces the removal of his office to 384 Post St., San Francisco 8, California, for the practice of general surgery and thoracic surgery.

Dr. William H. Snyder, Jr. (*W.S.* 1933) writes briefly, in the second response we have received to our "singleton" letters, that he has been in the practice of surgery in Hollywood since leaving the General. He sends best wishes to all his friends.

From the office of Dr. James C. White, Chief of our Neurosurgery Service, come two items of interest: The Decima Asamblea Nacional de Cirujanos, in Mexico City last November, conferred upon Dr. White a diploma "por su meritorio trabajo y labor docente Internacional en el campo de las Ciencias Neurológicas"; a Spanish translation of *The autonomic nervous system,* by Drs. White, Smithwick, and Simeone, is being published by Artecnica of Buenos Aires.

* * *

THYROID CLINIC AFFAIRS

The year 1953 marks the 40th anniversary of the Thyroid Clinic at the Hospital. A study of respiration was begun by Dr. James Howard Means in 1913, in a triangular room below the present Out-Patient Amphitheatre. The orientation of Dr. Means and his colleagues in those early days quite naturally turned toward the thyroid because of the dominant role of that gland in controlling respiratory processes. Actually, it was 7 years later that regular weekly meetings of the workers in the clinic were held for the assessment of patients and the discussion of their specific endocrine problems.

From its beginning until the present, the Thyroid Clinic has performed a dual role within the Hospital. On the one hand it has helped in the care of patients and on the other it has attempted through clinical and laboratory investigations to explore the physiology of the thyroid gland and its role in the economy of the body and in disease states. As the years have passed, more and more emphasis has been placed on laboratory studies, but one should hasten to add that the end in view has always been the care of the patient. For example, in 1939 there began under the direction of Dr. Saul Hertz studies of the physiology of the thyroid gland as measured by the use of radioactive iodide. At its inception this study was done entirely on experimental animals, but by 1942 sufficient information had been accumulated to warrant the use of radioactive iodide as a therapeutic agent in the treatment of Graves's disease. Since that time, patients all over the world have had the benefit of this form of treatment, and in addition diagnostic tests employing radioiodide have been developed.

Each morning, in the Metabolism Laboratory on the first floor of the Bulfinch Building, determinations are made of the basal metabolic rate. After the patient has rested for a half-hour or longer, the rate at which he consumes oxygen is measured, and subsequent to this he sees one of the research fellows or visiting physicians for appraisal in the light of the available clinical and laboratory data. At this time appropriate treatment may be prescribed, or further laboratory studies may be ordered. If the patient presents a particularly difficult problem in diagnosis or management, he may be asked to return either on Tuesday afternoon at 2 o'clock or Wednesday morning at 11 when the various members of the Hospital staff who are interested in thyroid disease meet together. In this way, the patient derives the benefit of the combined opinions of several physicians and several surgeons. In addition, these clinic meetings serve as teaching exercises for students, house staff, and visitors.

The Thyroid Laboratory occupies a large part of the east end of the Bulfinch basement. In addition to its research facilities, it is equipped to measure the protein bound iodine of the blood and to determine the utilization of radioactive iodine by patients. These two measurements, coupled with the basal metabolic rate, usually enable the clinician to make a satisfactory estimate of the metabolic status of the patient and to assess the function of his thyroid gland.

One of the principal projects of the Thyroid Clinic over the years has been a study of the effectiveness of radioactive iodide in the treatment of Graves's disease and of the physiological consequences of radioactive iodine therapy. Over the course of 10 years the clinic has treated approximately 500 patients. Radioiodide has been established as an effective agent for the treatment of this disorder. Almost all of these patients are still under periodic observation. This group is the largest and most carefully studied of any in existence.

In addition to Graves's disease, radioactive iodide is sometimes of benefit in the treatment of carcinoma of the thyroid.

For a number of years the investigators in the Thyroid Clinic have been interested in thyroid cancer and in devising ways and means of improving the treatment of this disease. This has been a combined project of the physicians who have explored the value of radioactive iodide, and of the surgeons who have aided by obtaining biopsy material and in carrying out the necessary surgical procedures for the extirpation of the tumors. In addition, many patients with carcinoma of the thyroid have graciously lent themselves for extensive investigations on Ward 4, wherein observations have been made of the metabolic fate of radioactive iodide and of the effects of large doses of radioactive iodide on the patient as a whole, on his tumor, and on his bone marrow.

The activities of the Thyroid Clinic have not been confined to studies on man. The laboratory has been concerned with certain chemical studies on thyroid tissue, on the production of cancer of the thyroid by various agents, and on the effects of radiation on thyroid tissue. Each investigator in the clinic has his own laboratory project. The problems of the laboratory are so closely related to the problems of the patient as to make them inseparable.

The remarkable growth of medical physics, particularly as related to radioactive isotopes, has inevitably meant that the Thyroid Clinic, through its use of isotopic iodine, has required the close cooperation of the physicist. Three years ago Dr. Gordon Brownell joined the Thyroid Clinic and subsequently established his own Department of Physics in the Research Building. Since that time a productive and warm relationship has existed between Dr. Brownell and the Thyroid Clinic.

The clinic is very proud of its close association with other thyroid clinics and laboratories. Since 1942 there has been close cooperation and friendly interchange of information between our group and that under the direction of Dr. Samuel Haines, an MGH graduate (*W.M.* 1921), at the Mayo Clinic. Over the years our clinic has also enjoyed a cordial relationship with the important groups in London, especially those of Sir Charles Harington at Mill Hill, Dr. Selwyn Taylor of the Hammersmith Hospital, and Dr. E. E. Pochin of the University College Hospital. Drs. Means and Lerman of this clinic and Sir Charles have had a joint project on chemical analogues of thyroxin in progress for twenty years. More recently there have been cooperative enterprises with the clinic of Dr. Richard Goldsmith in Cincinnati, and for the past two years the Thyroid Clinic has enjoyed a most happy and cordial kinship with the Instituto del Bocio at the University of Cuyo, Mendoza, Argentina. Perhaps our most important and productive association has been with Professor Robley Evans and the Department of Physics at the Massachusetts Institute of Technology.

The clinic is also proud of the many friendships it has established with physicians and investigators from many parts of the world who have visited with us from time to time. Over the years we have had innumerable happy opportunities to exchange information with visitors from nearly every country of Europe and Central and South America, and on occasion with friends from Africa and the Far East. The education which the Thyroid Clinic has derived from these visitors is immense. For an example, it was one such visitor who provided the spark which led to an expedition from the Thyroid Clinic to the Argentine Andes in 1951, for the study of endemic goiter.

The exciting thing about the thyroid gland is that, in spite of 40 years of active investigation and research, many baffling problems still beg for attention. For instance, the cause of Graves's disease is as illusive as ever. The treatment of Graves's disease is good, but by no means perfect. We still have much to learn of the nature of goiter, and especially of the benign and malignant tumors of the thyroid gland and of their treatment. No one even knows to this day why goiter exists in areas of iodide abundance, such as the Eastern Seaboard of the United States, nor does one know why an occasional patient with Graves's disease suddenly develops a rapid progressive protrusion of his eyes which may be so severe as to lead to permanent impairment of vision. These problems and many others occupy us now and will continue to occupy us in the years to come.

John B. Stanbury, M.D.,
Assistant Physician
and *Head of Thyroid Clinic*

BIOGLET

Dr. Edward Dunn, Assistant Resident in Surgery—born in Englewood, New Jersey, February 4, 1925; New York University; U. S. Army: 98th Field Hospital, Pacific Theatre, 1943-46; M.D., Syracuse University, 1951; Intern in Surgery, Presbyterian Hospital, New York City, 1951-52; home: Englewood, New Jersey.

I think there is such a thing as a "surgical instinct" and that it comes from the effect of the wonderfully evolved human hand upon the brain, or vice versa. "Surgeon", after all, is a corruption of "chirurgeon" (Greek — cheirourgos) — or handicrafter—he is the doctor who treats disease by manipulation. Manipulation, of course, is primitive, and even when the hand is separated from the diseased object by the length of an instrument, it represents a shorter nervous circuit than the one which leads to the gathering and administration of herbs and simples, or to the propitiation of offended deity. When a man is transfixed by an arrow, for example, the need to remove it is obvious and the technique of doing it is learned by trial and error —with the hands. It takes more subtlety and more education to see how a diseased part is benefited by potions or penicillin administered remote from the site of injury—and still more to understand the mysterious workings of sacrifice and prayer. The activities of sorcerer and priest thus represent something higher in the evolutionary scale, and closer to that pure *a priori* reasoning power, uncontaminated by manipulative experiment, which philosophers would have us believe is man's greatest distinction and highest glory.

While the surgeon, then, goes back in evolution to an instinct—the monkey picking the head of the other monkey, the child taking his doll apart—the physician, evolved from sorcerer and priest, stands at the end of a long religious and scientific historical development whose most primitive sources are already complex.

It seems unfair, accordingly—and certainly ironical—that the surgeon, a relatively ignorant fellow, monkeying with disease because he just can't keep his hands off it, should have had so much success in treating this enormously complex, delicate, and subtle body of ours. He has gone on from removing the arrow to excising the diseased organ or tissue; to playing plumber and electrician rearranging the body's system of pipes, tanks, and wires; and finally to trespassing on the physicians' domain by pruning the overactive tissues that produce the excessive humors responsible for systemic disease. A lot of his success has probably been viewed by contemporary physicians as like that of a small boy making a recalcitrant slot machine work by kicking it.

One hundred years of success has made the surgeon a vain fellow, his vanity only made worse insofar as he has been aware of the physicians' feeling that more luck than cleverness has made him successful. With his robes, his ritual, and the histrionics of his operating theatre he seems to seek to impress the awed spectator that this is no mere handicraft, but a difficult, elaborate, and sacred art, teachable only to the elect, and then only at the cost of long watching, fasting, and prayer. How splendid for him if the ritual grows more elaborate: the audience, with the advent of color television, larger and further removed from the all-too-human aspects of the sacrificial scene; the training longer, costlier, and more ascetic; and the elect pinnacled on a taller and more multiply-layered hierarchic pyramid.

But this is not splendid enough, and another revolution—of vanity, perhaps—prevents this flowering of baroque art from occurring—vanity, because by that road the surgeon sees himself becoming merely a useful, but dangerous and temperamental, demiurge in the keep of the sorcerer-physician. Furthermore, the rites without novelty are not spectacular; the established procedures to some degree grow simpler rather than more complicated; and new things now come more from science than from art and empiricism.

Led only by the primordial manipulative instinct, the proud dream of the barber surgeon, struggling in the hard school of experience, could become, in turn, the vainglory of an impressive priestcraft, and then the vanity of a highly-paid technician. But something in the tradition of the whole healing art reaches out to prevent this from happening.

A specialty can be viewed narrowly or it can be seen as part of the whole social fabric. Cicero, trying to outline what the ideal orator should be like, found it necessary to bring in broader and broader human attributes and concluded that the perfect orator should be the perfect man. There is something grandiose and imperialistic in assigning so large a role to the orator; but it is also inevitable, so long as specialists are men, that the perfect specialist must be the perfect man. Similarly, the surgeon, as he tries to absorb physician and scientist into his being, becomes more human. Paradoxically, it may be an act of vanity for a man to seek a role larger than himself, but the result is humbling to the man. Furthermore, by maintaining science and medicine in its scope, surgery accepts two strongly developed and specifically humbling traditions—the scientists' acceptance of fact, and the physicians' ideal of service to mankind.

Recognizing the impulsions toward narrowness and vanity which, one would think, are almost intrinsic to the specialty of surgery, the tradition of the Massachusetts General Hospital has long been that the surgeon should be humble, and that he should be broad in his sympathies and interests.

I am smug and provincial enough to believe that that tradition has met with striking success. Ask yourself if you find enough stimulation to work and learn here, and then whether you are comfortable here—and if the answer to both questions is in the affirmative, I am right.

Dr. Beecher, particularly at the end of a long and fussy operation, likes to ask the rhetorical question, "Are surgeons people?" My considered answer to that, in terms of the M.G.H. would be—"Yes, only somewhat larger than life-size."

Vanity, you see, is almost inevitable.

George S. Richardson, M.D.,
Assistant Resident in Surgery

HAPPY BIRTHDAY—GENERAL STORE

After some months of consideration and investigation of previously established shops in other hospitals, the Ladies' Visiting Committee received permission from the Trustees on December 13, 1940 to establish the General Store in the then recently-abandoned cashier's quarters in the Moseley Building; and with the loan of the Katheryn Hoyt Watson Fund, which was a $1000 unrestricted legacy to the Ladies' Visiting Committee, stock was purchased and the doors were opened on March 5, 1941.

The Store was established and has since been maintained to meet, primarily, the needs of the MGH family; and Mrs. Crouch, the first director, quickly established so warm a relationship with this group that on the first birthday a cake was received from an appreciative lay patron, a singing telegram from a group of doctors, and a poem from "the boys down under", i.e., the boiler room employees. With Mrs. Crouch at the start, and Mrs. Burnell and Mrs. Warton for the last ten years, the Committee feels that this close and happy relationship with the Hospital has been preserved.

The Store was a financial success from the start, stock gradually being built up in response to the special demands of its customers, and by the end of 1943 it had paid back the $1000 loan and had turned over $1000 more to be spent by the Ladies' Visiting Committee in various ways for the benefit of the Hospital and its patients. For the first few years profits were allowed to accumulate, to establish a nest egg for possible future developments, and in 1951 $8000 was sent to the Treasurer of the M.G.H. to be invested, its interest to be added to the capital, until it might be needed by the Store. The average net gain for the 11 years is approximately $4000 per year, from which $27,000 has been turned over to the Ladies' Visiting Committee. These funds are used by that Committee as its "General Fund", covering many needs and helping support many pioneer activities in the Hospital. This yearly income has freed the members of the Committee from individual financial responsibility in supporting their program, so that visiting the sick and rendering various other services to the Hospital are all that is now required from its members.

In looking back over the Store's monthly reports to the Ladies' Visiting Committee, we live again the days of war shortages. By May 1943, candy, chewing gum, and stockings were all "short", and when we got in a supply, days were hectic! Names were entered on a waiting list, and when a shipment of stockings came in, in December, 104 pairs were sold in a week—every one of which had to be separately measured. When cigarettes came in, they were divided into three lots so that people on duty on different days might have a chance at them; and when they were put on sale they went out as fast as change could be made. The Store did all it could to keep distribution fair; and by October 1947 a note in the minutes of the Committee reads, "Rayon stockings are now in plentiful supply."

Little change has been made in the physical set-up of the Store, though a washbasin was installed in the stock closet in 1949—much needed where so many greeting cards must be handled, and the collapsible doors were added in 1951, behind which the racks can be locked up when the Store is closed. No extra space has been officially added to the original, but the racks have increased and have grown out into the corridor to a healthy degree!

Following out its main purpose of serving the Hospital as best it could, cigarette machines from which the Store gets the return were installed in four places in the Hospital. However, our profits from these machines are only one-half of that made "over the counter", the buyer pays 1¢ more per pack, and the chance of our making a secondary sale is lost whenever the machines are used. A postage stamp machine and two Coca-Cola machines also "work" for the Store. In 1952 the proceeds of the latter were turned over to the MGH Staff Wives Hospital Committee to cover the expenses of entertaining doctors here from other countries.

In 1947 the experiment of having a cart with limited supplies visit the wards was tried and given up, but in 1952 this project was revived and is now a successful and expanding adjunct to the Store.

An $80 day brought great cheer at the start, but now there are many days with receipts of over $200. The record for a single day—$451.00—was reached in Christmas week of 1949. Something like 48,000 greeting cards were sold last year—an indication of the volume of just one of many items.

Mrs. Burnell and Mrs. Warton have earned the gratitude of everyone for their cheerful and tireless efforts to keep the stock up and in order, as well as to wait upon the loyal patrons, to whom our thanks is justly due.

In the years ahead, it is our hope to fill the needs of our customers, so that they, in turn, by their patronage may help to fill other needs in the Hospital.

Helen R. Gray,
Treasurer of the General Store

[Encomiums to the General Store staff from all of us at M.G.H. for a grand job well done, and best wishes for many happy returns of your birthday.—*Editor*]

VOLUNTEER GROUPS

LADIES' VISITING COMMITTEE
MASSACHUSETTS EYE & EAR INFIRMARY

The Annual Meeting of our Committee was held on January 14. The following officers were elected:

Mrs. V. H. Kazanjian, Chairman
Mrs. F. T. Hunter, Vice-Chairman

Our Annual Rummage Sale will be held at Horticultural Hall on April 14. Rummage of any kind is urgently needed—bric-a-brac, china, glass, clothes, household utensils, etc. Rummage will be gladly received at any time at the Nurses' Home, 14 Embankment Road.

As this is our main source of revenue, we shall be very grateful for any contributions.

BOARD OF MANAGERS
VINCENT MEMORIAL HOSPITAL

The Board of Managers of the Vincent Memorial Hospital has been meeting regularly on the second Thursday of every month. As usual, the reports from the monthly visitor and the nursing supervisor were discussed. The members of the Board were especially interested in the informal report given them at their January meeting by Miss Constance McGrath, the Vincent's Medical Social Worker. It was pleasant, too, to join with the members of the Massachusetts General Hospital Ladies' Visiting Committee at luncheon.

Several members of the Board, as well as Miss Carlisle and Miss Corkum, served as sight-seeing guides for the new members of the Vincent Club when they visited the Hospital before embarking on their Provisional project of securing advertisements for the annual Vincent Show Program.

The Board of Managers of the Vincent regret the loss of Miss Adele Corkum, and hope she will find her back-to-school work interesting and rewarding.

LADIES' COMMITTEE
BAY STATE MEDICAL REHABILITATION CLINIC

I wonder if you know about the Bay State Medical Rehabilitation Clinic, where civilian teen-agers and adults who have been handicapped by accident and disease are taught how to use what they have left and therefore become useful to themselves and to others. This Clinic, located on the grounds of the Massachusetts General Hospital but completely independent of it, was started less than two years ago under the guidance of Dr. Augustus Thorndike, President of the Corporation, and Dr. Arthur L. Watkins, Medical Director. This Rehabilitation Clinic serves all handicapped patients, wherever they may reside, if they have been referred by a physician, clinic, or hospital. The Clinic has had patients from all over New England and from a number of other States in this country. Also, patients have been admitted from Panama, Mexico, and South America. The United Mine Workers of America, Welfare and Retirement Fund, always has eight patients for rehabilitation services at the Clinic under their sponsorship. An average of 25 patients a day are brought here either by car, taxi, or public transportation; or, if hospitalized, by wheel chair from one of the buildings of the Massachusetts General Hospital.

At the Bay State Medical Rehabilitation Clinic, under the guidance of the medical director, a team made up of social workers, physical therapists, occupational therapists, and volunteers, work with the patient to help him carry out the specialized treatment and training, planned by the physician, that will enable him to regain a maximum use of himself as an individual. Instead of sitting in a wheel chair at home or being waited upon by his family, the handicapped individual goes to the Rehabilitation Clinic and gradually adds to the list of things he can do for himself, thereby adding to his mental health and happiness. Many people know that physical therapists teach the handicapped such things as how to walk with braces or with an artificial leg, how to get in and out of a chair, and how to climb a stairway that has a railing. But quite a few individuals do not seem to realize that occupational therapy is not just "busy work", but is, rather, an interesting method of exercising the muscles to increase motion in an arm or shoulder. Instead of using calisthenics, the handicapped person performs purposeful activities, such as carpentry, weaving, printing, typing. The occupational therapist also instructs the patient in ways to dress, eat, and keep house for herself, for the Clinic has a complete kitchen—a retraining center for the handicapped housewife.

And where does the Volunteer Service fit into this medical rehabilitation picture? The Volunteer Service is in operation at the Bay State Medical Rehabilitation Clinic five days a week—individual volunteers being scheduled for one half-day a week. Volunteers push wheel chairs from the Massachusetts General Hospital buildings to the Clinic, prepare morning coffee for patients and staff, do errands for the physical therapists, assist the occupational therapists, and sometimes go shopping for special supplies they may need. Volunteers add the human touch to the Clinic by helping both the patients and the staff.

The Ladies' Committee of the Clinic is ever searching for volunteers who have willing heads and hearts and hands. The Committee's functions are threefold: to find volunteers to actually help at the Clinic; to give publicity to the medical rehabilitation service rendered at the Clinic; and to raise funds to cover the cost of extras, such as furnishings, equipment, parties, taxi transportation for the needy, and recreation for the hospitalized patients. The handicapped patients who are hospitalized because they are at present helpless crave to be a part of the outside world. Viewing television is one way to make him feel he is in touch with the outside. The Ladies' Committee was given a television set for the Clinic, and evening volunteers wheel handicapped patients from the Hospital to the Clinic for television evenings on Mondays and Wednesdays. It was the Ladies' Committee which saw to it that the Clinic building was attractively decorated, and by securing donations of furniture from interested friends the Clinic has assumed a homelike atmosphere. It is the Ladies' Committee that arranges for morning coffees in various communities around Boston, to raise funds for Clinic needs.

The Bay State Society for the Crippled and Handicapped, the Easter Seal Society, gives financial support to the Bay State Medical Rehabilitation Clinic. The Eighth Annual Report of the Easter Seal Society says, "An enviable record of service was achieved by the Bay State Medical Rehabilitation Clinic which is supported by Easter Seal funds. For the fifteen months of operation ending September 1, 1952 the center admitted 276 patients for specialized treatment and training. Concerned with helping physically handicapped adults return to useful living, it has, during that same period, discharged 223 of its patients. Of that number, 48 have been restored to gainful employment, three-quarters of these to their former employers. Fifteen housewives were restored to homemaking and 18 patients were made more self-independent at home. Another 68 patients were helped and then referred to other agencies to complete treatment or for vocational training."

Thank you for telling others about the Bay State Medical Rehabilitation Clinic and its service to adults who have been handicapped by accident or disease.

Harriet F. Griswold,
Chairman, Ladies' Committee of the
Bay State Medical Rehabilitation Clinic

DISTAFF CLUB

The Distaff Club held its monthly meeting on January 22 and elected new officers for the coming year. They are:

President	Mrs. Thomas Peebles
Vice-President	Mrs. Richard Kleaveland
Secretary	Mrs. Charles Huggins
Treasurer	Mrs. John Binion
Housing	Mrs. Jack Tetirick

Those members who have just successfully completed their year as officers are:

President	Mrs. Stuart Ragland
Vice-President	Mrs. Wilbur Thomas
Secretary	Mrs. John Burke
Treasurer	Mrs. John Freymann
Housing	Mrs. Rhett Talbert

In the coming year we hope to have new projects which will encourage a larger attendance at all meetings. This is the one opportunity for the wives of the house staff to meet each other, and our goal is to build an active organization. We started the year successfully with a record dance in the Penthouse on February 14. Notices of all coming events and meetings will be posted on the new Distaff Club bulletin board in the Brick Corridor. We hope the husbands will relay any news to their wives.

The new officers are looking forward to working with all of you.

MASSACHUSETTS GENERAL HOSPITAL
VOLUNTEER SERVICE DEPARTMENT

The Boston Metropolitan Chapter of the American National Red Cross has appointed Mrs. John O. Wilson of Lincoln as Chairman of day Nurses' Aides at the Massachusetts General Hospital. Mrs. Wilson has been a volunteer here for over ten years, and at present assists in the Tumor Clinic every Monday.

As *day* Nurses' Aides are urgently needed in the Hospital, Mrs. Wilson suggests that all who are interested in this service should write for information and the date of the next course to

Boston Metropolitan Chapter
American National Red Cross
17 Gloucester Street
Boston, Massachusetts

mentioning that they have a special interest in serving at the Massachusetts General Hospital.

At the present time there are 72 volunteers who are Red Cross workers at the Massachusetts General, 26 Nurses' Aides, 4 Red Cross Arts and Skills workers, and 42 Gray Ladies.

More volunteers are always needed.

MASSACHUSETTS EYE & EAR INFIRMARY

The Ophthalmic Staff of the Infirmary has set up a fellowship in honor of Dr. Frederick H. Verhoeff, Consulting Chief of Ophthalmology. This new fellowship will come chiefly from a fund collected by the Staff. The income will be used for research and study at the Eye and Ear and will be administered by a committee composed of members of the Ophthalmological Department.

A Bronze Star with Combat V was awarded to Dr. William Montgomery, Resident in Otolaryngology, for service in Korea. The presentation was made on February 11. Dr. Montgomery, who served with the Marines as a battalion surgeon, received the medal for "heroic achievement under fire"—in this case, care of the wounded during an artillery barrage. Dr. Montgomery has also received the Purple Heart and a Commendation Pendant with Combat V.

Several Infirmary doctors took part in the New England Ophthalmological Society meeting, held at the Infirmary on February 18. Dr. Abraham Pollen and Miss Ann Stromberg, orthoptic technician, presented a discussion on "Practical orthoptics". Dr. Robert R. Trotter spoke on "An ophthalmic survey in the Ryukyu Islands". At the evening meeting, Dr. Albert E. Sloane gave "An initial report on school vision testing problems".

Dr. W. Morton Grant of the Howe Laboratory read a paper before the Ophthalmological Section of the Philadelphia College of Physicians on January 15. Dr. Grant's subject was "Various aspects of the study of glaucoma".

Miss Madeline Shipsey, Case Work Supervisor in the Department of Social Service, has been appointed as a special lecturer at the Simmons College School of Social Work. Miss Shipsey assists Miss Harriet Bartlett, Professor of Social Work, in conducting monthly workshop sessions for the field work supervisors, who are in charge of the hospital field work of Simmons students.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column.

The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staffs, so that our readers may keep up to date on *current* Massachusetts General and Eye and Ear literature. *This purpose has been destroyed when authors or departments have postponed for several months the reporting of such titles.* In a few instances these reports have been withheld until after the close of a calendar year, and then lists of all titles which appeared during the previous twelve months have been submitted—too late to appear in our month-by-month listing.

Our aim still is to make it possible for our readers to find in our publications column, conveniently arranged under subjects, *all* titles of *current* material emanating from our two hospitals. *That aim can become a reality only through your cooperation.* Therefore, we repeat our monthly plea that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address. Your title should be classified with respect to subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

General Surgery

Churchill, E. D.
The architectural basis of pulmonary ventilation.
Ann. Surg. 137:1-11.

Neurology, Neurosurgery, and Psychiatry

Ballantine, H. T., Jr., and White, J. C.
Brain abscess: Influence of the antibiotics on therapy and mortality.
New England J. Med. 248:14-19.

Orthopedic Surgery

Barr, J. S., and Record, E. E.
Arthrodesis of the ankle joint: Indications, operative technic and clinical experience.
New England J. Med. 248:53-56.

Sterility

Simmons, F. A.
Correlation of testicular biopsy material with semen analysis in male infertility.
Ann. New York Acad. Sciences 55:643-656.

Simmons, F. A.
Robert Latou Dickinson: An appreciation.
Fertil. & Steril. 4:1-9.

News concerning Dr. John B. Kinmonth has reached us through Dr. John P. Monks, Assistant Physician on our Staff. A note from Dr. Monks reads:

> On a recent very brief and flying trip to Europe I saw Dr. and Mrs. John Kinmonth. He was a Fellow in Surgery at M.G.H. three years ago. He and his wife are close friends of mine—indeed, my wife is their eldest's godmother. Ralph is now 3½, and is as handsome a child as comes. His younger brother bears the good Scotch-Irish name of Fergus.
>
> John, as I understand it, is now second in the chain of surgical command at Bart's (St. Bartholomew's Hospital) in London. He does general surgery, but still has time for his special field of interest of relieving arterial spasm caused by wounds. He said that Dr. Simeone (*W.S.* 1936) wrote him recently that three cases in Korea had been successfully treated according to John's ideas. He also has started acting as an examiner in surgery for the medical students' final hurdles.
>
> He looked very fit, and recalled with pleasure his days at M.G.H.

A most interesting letter has come from Dr. Arthur C. Guyton (*W.S.* 1943). His was the first response we have had to letters we are sending out to all MGH "singletons"—those MGHers who have the distinction of being the one and only alumnus of Massachusetts General in their particular countries, States, or cities. We have asked for information regarding their own activities and also for anything of particular interest in the "local color" category. It seems as if some engaging and significant replies should be forthcoming.

Dr. Guyton writes:

> I was very much pleased to receive your recent note requesting that I send you a letter for publication in The News. Recently, for other purposes, it was necessary that I get together a list of my activities and publications. Therefore, instead of attempting to rewrite this information I will simply send you a copy of the material which has already been gathered, and you may choose from it whatever you desire.
>
> It is surprising to me that I am the only alumnus of M.G.H. in Mississippi, and I hope this state of affairs may be remedied soon. As you possibly know, this State at present is undergoing a tremendous expansion in medical facilities, including the construction of an entirely new medical school at Jackson. The basic unit of this school is now being built at a cost of slightly over $9,000,000. In addition to this, several private hospitals to be operated in conjunction with the school are now under construction in the immediate vicinity of the basic unit. Therefore, we soon will have a medical center in Jackson which should attract many alumni from the M.G.H.
>
> My own position with the present smaller medical school located at Oxford, Mississippi, is Chairman of the Physiology and Biophysics Department. When the new plant in Jackson is completed, we will transfer our activities to this new locus, with the idea of expanding our department.
>
> The opportunities for medicine in Mississippi are tremendous. The number of patients per doctor in this State is approximately four times as great as the number of patients per doctor in the Boston area. It is very surprising to enter one of the smaller hospitals in this region and find therein a great variety of very serious diseases or surgical problems, many of which, I was taught in Boston, are relatively rare. Yet, despite the great amount of pathology to be found, there is still a great need for competent doctors to cope successfully with the problems.
>
> Geographically, the winters are very mild compared with those in New England, and the summer temperatures are not a great deal different. The long spring and fall months are particularly delightful, though I must say this is not entirely conducive to tedious indoor work.
>
> Those of us who have previously worked at the Massachusetts General Hospital always look back to it as a mecca of medical knowledge. Therefore, once again I want you to know how happy I am, always, to hear of the activities at the M.G.H. I also welcome this opportunity to give you a small insight into what we are doing in the State of Mississippi.

The enclosed data mentioned above

THE GENERAL STORE—CHRISTMAS WEEK, 1952

includes an amazing list of professional accomplishments and a broad range of outside interests, such as training in wood and metal work and in glass blowing; the procurement of both amateur and commercial radio licenses, and licenses for first-class radiotelephone and second-class radiotelegraph work; and electronic development work in medical research equipment. He has developed a special patient hoist for paralyzed individuals, an electrically guided and propelled wheel chair for one-finger operation which requires pressure of less than an ounce (now in commercial production), and an automatic knee locking brace for paralyzed legs (now in the process of further adaptation by the Mellon Institute for Industrial Development).

A picture of Dr. Guyton, taken in 1947 at Warm Springs, Georgia, while he was demonstrating the electric wheel chair he had invented, may be found in the February 1948 issue of THE NEWS. As most of you know, Dr. Guyton was stricken with polio in 1946, six months after he had returned to M.G.H. for his residency training which had been interrupted by two-years' service with the U. S. Navy.

Titles of 34 publications by Dr. Guyton (all of which have appeared since 1946, incidentally) show that his professional interests are not confined to polio alone. As he says in an article in the November 1952 issue of *Wellesley Alumnae Magazine,* which Dr. Castleman very kindly brought down to us:

> . . . I am also just as much interested in the other fields of medical research as in polio, if not more so. For instance, the challenge of heart disease—which has been my major interest for many years—is infinitely greater than is the challenge of polio, for heart disease is equally crippling and far more prevalent than is polio. Though the research that I have done on heart disease does not carry the same public interest as does the development of eye-catching gadgets, I am more than sure that the value of the work from our cardiac laboratory is vastly more important medically than anything I have done or ever will do concerning polio. . . .

The list of Dr. Guyton's publications is posted on the bulletin board near the foot of Treadwell stairs for all those who are interested.

We hope Dr. Guyton will not object to our remembering, in print, the splendid adjustment he made when he found his chosen field of surgery closed to him. Because of this and the many honors that have been conferred upon him since his graduation from both high school and university with the highest scholastic average in his class, it is easy to understand why he was chosen by the United States Junior Chamber of Commerce as one of the Ten Outstanding Young Men of America for 1951.

A letter from Lt. James M. Davis, MC, USAR (*S.* 1948), written in Japan last January, contains news about several MGH-ers in military service over there. His letter reads:

> The MGH NEWS has been forwarded regularly by my wife and is enjoyed more than ever.
>
> Thought I'd write to let you know what the MGH people in this area are up to. I've been lucky enough to see quite a few of them in the past few months. Within a week of the time I arrived in Japan I ran into Austin Vickery and Bob Scully who, as you know, are assigned to the 406th General Medical Laboratory here in Tokyo. I was assigned to a hospital a few miles from Yokohama. After being there only six weeks I returned to the States for Part I Surgical Board examinations, and was lucky enough to get back to Jacksonville just two days after our third child, Katherine Walker, was born.
>
> On my return to Japan I was assigned to Tokyo Army Hospital, and soon found that Harry Makel is the Chief of Anesthesia and John Duggan is on the Pediatric Service. John and Kae will soon be leaving for the States for him to take his boards.
>
> Christmas day was happily spent with John Littlefield and Bob Hopkins at the home of Olivia and Jim Lefevre in Yokohama. (Olivia Swain, formerly, who worked in Dr. Francis D. Moore's lab at the M.G.H.) Bob and John are on a hospital ship which was in dry dock during the holidays.
>
> Roger Wilcox was recently in Tokyo on leave from Korea, but I didn't have a chance to see him. He hopes to head home in the next month or so.
>
> I believe it would be best for you to continue sending THE NEWS to my Jacksonville address, as I'm not at all sure how permanent my stay here will be.
>
> My best to all at the M.G.H.

We are always particularly pleased to receive letters from those who have been here at M.G.H. on fellowships. This letter, enclosed with his subscription to THE NEWS, came from Capt. Joseph E. Levinson, MC, USAR (clin. & res. fel. *M.* 1952).

> Since leaving the M.G.H. last June I have wandered about some of the arthritis clinics in Scotland and England, relaxed in Paris, begun and ended a private practice in internal medicine and a teaching affiliation with the Medical College in Cincinnati, and am about to embark on a recall to active duty as a Captain with the Army. I have been assigned to the Army and Navy Hospital in Hot Springs, Arkansas.
>
> There are many MGH alumni in Cincinnati. Among the more recent arrivals are Gordon Black (GU Surgery, 1950) and Richard Goldsmith (Thyroid Group, 1950).

This note was attached to a subscription card from Dr. Henry W. N. Bennett, Assistant to Dermatology from 1928 to 1936. His address is 1448 Elm Street, Manchester, New Hampshire.

> Not much to write about. Am in my 80th year. Most of my associates in Dermatology and South Medical have passed on. I still keep regular office hours, and am a consultant at two local hospitals. This will not be so much longer, I fear. Thrombosis of the central vein of the right retina and the beginning of glaucoma is the diagnosis of the eye men here.

This delightful letter came not long ago from Dr. Nils Bengt Skanse (res. fel. *M.* 1948).

> It is a great pleasure to receive THE NEWS. It is a big event each time it arrives, and I hasten to read it with the same enthusiasm as children show for comic strips and as I felt when I read *Barnaby* in Boston. I am surprised at the amount of interesting information you are able to collect for each issue.
>
> We are now living at Malmoe, Sweden. I work on the Medical Service of Malmoe General Hospital, which is part of the University of Lund.
>
> The highlight of last year was the visit of Dr. Means and his lovely family in July. Dr. Means was in very high spirits and just as enthusiastic and vigorous as ever, or perhaps even more so. One day we took a ride round the countryside to look at churches, old castles, and so on. Toward evening we passed an old tower, and we couldn't keep Dr. Means away from climbing all the stairs. The rest of us were too tired.
>
> I must tell you a little story for the MGH baseball fans. Last October I got a telephone call from Dr. Rulon Rawson in New York, who wanted some information. The telephone call came through just as we were listening to the final game of the world series. I was then able to tell Rulon the score after five innings of play, which he didn't know. Thus, this piece of information went from Ebbetts Field in Brooklyn to Malmoe, Sweden, and then back to New York. Quite an odd detour!
>
> If any people from the good old M.G.H. are ever here in Scandinavia, I hope they won't forget that M.G.H. has a metastasis in Malmoe, Sweden.
>
> My wife joins me in sending best wishes to you all.

THE NEWS

No. 122 Boston, Mass. April 1953

DENTAL SERVICE ACTIVITIES

In the reorganization of the Harvard School of Dental Medicine the clinical facilities of the Massachusetts General Hospital are used in the training of students and interns and also at the fellowship level. Key staff positions are held by appointees of both institutions. For investigative work, laboratory facilities of the Harvard School of Dental Medicine are available. Most of the laboratory studies being made are the result of clinical observations on patients at the Hospital.

Over a period of several years a study of salivary gland disease has been in progress. The observations were based upon the clinical, gross and microscopic findings. An attempt was made to evaluate sialography as a diagnostic aid. At the present time, over 400 patients with salivary gland disease have been studied and, as a result, the value of sialography has been established. In this large group of patients diseases of the salivary glands other than neoplasia and obstructions are recognized and have stimulated further research. In particular, patients may have painless swelling of the parotid gland, in which X-ray examination visualizes a cystic dilation of the duct radicles. Associated with these abnormalities is a marked increase in the viscosity of the saliva. This finding has stimulated studies on secretory control, variations in chemical and physical composition, and isolation of enzyme systems. Observations, so far, suggest many new concepts of salivary physiology.

In the consideration of any disease of the oral cavity, the local environmental factors are numerous and often difficult to isolate. Mucous membrane changes may be readily observed, but little understood. Studies made on excised mucosa from patients showing progression of changes, such as atrophy and leukoplakia, have revealed alterations in glycogen metabolism. The accessibility of the mucous membranes of the oral cavity has stimulated further study on mucous membrane physiology.

While much fundamental work is in progress in the laboratory, the Dental Clinic has its share of common complaints. The "canker" sore is now assuming the respected position as a subject for study. The causes of "canker" sores have been numerous. These have included allergy—bacterial, viral, and psychosomatic. Recently, serum complement fixation studies have been made, using herpes simplex antigen. This antigen is also used to skin-test individuals having recurrent "canker" sores. The results of this study reveal much information refuting the herpes simplex etiology.

Among other complex common complaints of patients in our Clinic is the unexplained pain along the distribution of the trigeminal nerve. At the present time every effort is being made to study this problem.

The above abbreviated description of some of our activities may suggest a revision of the meaning of the word "dental". We hope, however, that it means a more scientific approach to the study of diseases of the oral cavity.

David Weisberger, M.D., D.M.D.,
Chief of Dental Service

* * *

On Good Friday, April 3
there will be a short meditation service
in the Chapel
at one o'clock

* * *

On December 20, 1952, Dr. Edward D. Churchill, Chief of our Surgical Services, was made "Membre honoraire étranger" of La Société Belge de Chirurgie.

As we told you in our January issue, Dr. Stanley Cobb received the honorary degree of Doctor of Science during the opening ceremonies of the Psychiatric Institute of the University of Maryland, held in Baltimore last November. Since that notice appeared, we have secured a copy of the accompanying citation which was read by Dr. Jacob E. Finesinger, past Psychiatrist on our staff and now Professor of Psychiatry at the School of Medicine, University of Maryland. Our transcript of the citation reads:

> Dr. Stanley Cobb is the Bullard Professor of Neuropathology at the Harvard Medical School and Psychiatrist-in-Chief at the Massachusetts General Hospital. Dr. Cobb is one of the eminent neurologists and psychiatrists in this country. He graduated from the Harvard Medical School in 1910 and has spent most of his professional life at the Harvard Medical School. In 1928 he organized the Neurological Unit at the Boston City Hospital, which became an outstanding institution. He organized the first psychiatric department in a general hospital, at the Massachusetts General Hospital in 1934. He was among the first to recognize the importance of psychiatry in a general hospital and was a leader in recognizing the importance of psychoanalysis in psychiatry and medicine. His range of activities has been broad, and he is recognized in contemporary psychiatry as a scholar, investigator, and teacher. He has made contributions in the field of epilepsy, cerebral circulation, and psychosomatic medicine. He is the author of five volumes and is at present an editor of the *A.M.A. Archives of Neurology and Psychiatry*, the *American Journal of Psychiatry*, and *Psychosomatic Medicine*. His influence in the field has been great, and many of his students occupy leading positions in American neurology and psychiatry today.
>
> If I may add a personal word, Judge Cole, I have known Dr. Cobb well—and have worked with him for almost twenty years. To me, in addition to his other attainments, he is eminent in being a rare human being who has the unique faculty of finding and bringing out the best in those associated with him. It gives me great personal pleasure in presenting my former chief, my teacher, colleague, and friend, Stanley Cobb, for the honorary degree of Doctor of Science.

Dr. C. Guy Lane, past Chief of Dermatology at M.G.H. and now a member of our Board of Consultation, attended the 10th International Congress of Dermatology, held in London, England, last July. He was privileged to be presented to the Duke and Duchess of Gloucester, as the representative of the United States on the international committee which welcomed the Duke and Duchess to the Congress. Dr. Lane was also honored by being selected as one of the Honorary Vice-Presidents from this country to preside at the sessions of the Congress.

Dr. Lane also presided at the 11th annual meeting of the American Academy of Dermatology and Syphilology, held in Chicago on December 6-11. He turned over the gavel as President on the latter date to his successor, Dr. M. H. Ebert of Chicago.

The French Academie de Chirurgie has made Dr. James C. White, Chief of the ~~Neurology~~ Service at Massachusetts General, an "associé étranger".

* * *

Every subscriber to THE NEWS who contributes a donation over and above the subscription fee receives a note of appreciation from us. However, we wish to take this opportunity to express our thanks publicly to all our many contributors. As you may know, the small subscription fee does not cover the cost of production; therefore, we are most grateful for every supplementary donation.

During the year 1952, a total of $557.50 was received in addition to subscription fees—a very handsome amount, in our estimation!

MSCSN BALL

The Massachusetts State Council Student Nurses will hold a semiformal dance on April 16, from 8 to 12 P.M., at Longwood Towers in Brookline.

Music will be furnished by Russ Kelsey.

Price of tickets is $3.00 per couple, tax included.

Tickets are necessarily limited in number to 200—so first come, first served.

Tickets may be obtained from your own State Council representatives or from:

Miss Bonnie Gough—Massachusetts General Hospital

Mr. William Maurello—MGH Post Office Box 425

Miss Louise Jackson—Beth Israel Hospital

Miss Janet Spratt—Massachusetts Memorial Hospitals

Miss Marjorie Wheeler—Massachusetts Memorial Hospitals

Miss Barbara Gouthrie—Children's Medical Center

All student nurses are cordially invited.

The Board of Trustees, at their meetings on February 20 and March 6, voted:

To accept with regret the resignation of Dr. Nicholas M. Greene as Assistant Anesthetist, effective April 30;

To accept the resignation of Dr. Gustav G. Kaufmann from the position of Assistant in Medicine.

To appoint:

Dr. F. Dennette Adams to the Board of Consultation, as of July 1;

Dr. Ruth L. Cort as Out-Patient Resident on the Children's Medical Service for one year, beginning July 1;

Dr. James A. Flagg as Assistant Resident in Anesthesia, beginning January 1, 1954;

Dr. Thomas C. Hall as Assistant Resident in Medicine, beginning January 1, 1954;

Dr. John W. Hayden as Assistant Resident in Orthopedic Surgery for one year, beginning April 1, 1954;

Dr. Verner S. Johnson as Assistant Resident in Orthopedic Surgery for one year, beginning January 1, 1954;

Dr. William L. Kermond as Assistant Resident in Orthopedic Surgery, beginning July 1;

Dr. Philip L. McCarthy as Assistant in Dermatology, effective as of February 1;

Dr. Richard V. Wilson as Assistant Radiologist, beginning July 1.

Officers elected at the Annual Meeting of the Corporation were the same as last year with the exception of Dr. Arthur W. Allen, who was appointed by the Governor as a Trustee, replacing Dr. Francis P. McCarthy—February 4, 1953.

A note from Dr. W. Franklin Wood's office informs us that on February 2 Dr. Frederick E. Whiskin resigned as Assistant Psychiatrist from the McLean Hospital Staff.

At their meetings held on February 11, 18, and 25, the General Executive Committee voted:

To reappoint:

Dr. Melvin L. Taymor as Clinical Assistant in Surgery, assigned to Gynecology.

To appoint:

Dr. Giok S. Ang as Graduate Student Assistant in Medicine, assigned to Cardiology, effective January 1;

Dr. George Eisenman as Research Fellow in Anesthesia, beginning June 1;

Dr. Hermes C. Grillo as First Assistant Resident in Surgery, beginning March 1;

Dr. Adolph L. Gundersen as Second Assistant Resident on the Surgical Service, beginning April 1;

Mr. Helmut Hilz as Research Fellow in Biochemistry, effective as of the day he reports for duty next fall;

Dr. Gerald A. Kerrigan as Clinical and Research Fellow on the Children's Medical Service, effective as of July 1, 1952;

Theodore O. Macklin, A.B. as Research Fellow in Psychology, effective as of February 25;

Dr. André J. V. Ostende as Graduate Student Assistant in Surgery, for a period of six months, beginning February 1;

Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine, effective as of January 1;

Dr. Mary L. Scholl as Research Fellow in Neurology, for a period of four months, beginning January 20.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column.

As we told you last month, the purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. We also repeat, again in italics: *This purpose has been defeated when authors or departments have postponed for several months the reporting of titles.* Therefore, we again make our monthly plea that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address. Your title should be classified with respect to subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

General Surgery

Cope, O., Nardi, G. L., Quijano, M., Rovit, R. L., Stanbury, J. B., and Wight, A.
Metabolic rate and thyroid function following acute thermal trauma in man.
Ann. Surg. 137:165-174.

Wight, A., Raker, J. W., Merrington, W. R., and Cope, O.
The ebb and flood of the eosinophils in the burned patient and their use in the clinical management.
Ann. Surg. 137:175-183.

Laboratory Science

Nardi, G. L.
The *in vivo* conversion of glycine to serine.
Science 117:160-161.

Otolaryngology

Kelemen, G.
Nonexperimental nasal and paranasal pathology in hereditarily obese mice.
A.M.A. Arch. Otolaryng. 57:143-151.

MASSACHUSETTS EYE & EAR INFIRMARY

Last month the Infirmary held open house for Fellows of the American College of Surgeons. On the mornings of March 2-5, the operating room galleries of both services were open to visitors. As the New England Otolaryngological Society's annual meeting had been planned in conjunction with the program of the College of Surgeons, visiting otolaryngologists could attend the regular clinical meeting of the Society, held in the Infirmary on Wednesday morning, March 4. The Ophthalmology Department arranged an exhibition of stereoscopic photographs taken by Dr. David D. Donaldson, showing diseases of the anterior segment of the eye. Informal discussions on retina detachment and tonography were presented on Tuesday and Wednesday mornings, respectively.

Infirmary staff members took part in the formal meetings of the College of Surgeons. At the Section on Ophthalmology, held on March 2, Dr. Virgil G. Casten spoke on "Strabismus: Current attitudes". Dr. Brendan D. Leahey read a paper on "Fixation of corneal grafts". Dr. Edwin B. Dunphy presided.

Dr. LeRoy A. Schall was the presiding officer for the March 4 meeting of the Section on Otolaryngology, held in joint session with the New England Otolaryngological Society. The afternoon was devoted to a panel discussion on "Traumatic injuries of the face", in which Dr. Varaztad H. Kazanjian and Dr. Edgar M. Holmes participated.

THE CARDIOVASCULAR RESEARCH LABORATORY

Heart disease is mankind's most successful enemy. More people die every year from maladies of the heart and blood vessels than from any other cause. Small wonder that the Massachusetts General Hospital, throughout the years, has devoted attention to the conquest of the diseases of this family. Although total victory is not yet in sight, many battles have been won. Among the most dramatic of the Hospital's contributions have been important advances in electrocardiography and in the surgery of the pericardium. Pioneer research on the importance of the sympathetic nervous system in cardiovascular disease was done here. Dr. Richard Cabot announced the theme about which all of this work has been woven when he drove home the prime importance of seeking out the causes of disease.

Two years ago the Trustees implemented a resolve of the Research Committee to add another string to its cardiovascular bow. The Cardiovascular Research Laboratory was set up in almost ideal quarters on the first floor of the Research Building. The Hospital's earlier attacks on heart disease had been from the standpoint of the physiologist and the clinician. This new front was to be biochemical. Although our Trustees are typical Boston business men, this action of theirs represented a gamble. Could study of the chemistry of cells unlock the mysteries of cardiovascular disease? We do not yet know, but in the following paragraphs is outlined the direction in which our efforts are leading us.

The pump of the cardiovascular system is the heart. If one wants to have a proper understanding of the working of this pump, one has to know something about its motor. This motor is heart muscle. Thus, it is natural that the Laboratory has taken an interest in the biochemistry of muscle in general, and of cardiac muscle in particular. In charge of this phase of the work is Dr. John Gergely, a physician who also holds a Ph.D. degree in physical chemistry. Dr. Gergely is admirably qualified for this task, having learned muscle biochemistry from the pre-eminent master in this field, Professor A. Szent-Gyorgyi.

Researches in the past decade have shown that the contractile matter of muscle consists of two proteins: myosin and actin. They combine to form actomyosin. The energy source for the muscle machine is a phosphorus-containing organic molecule, adenosine triphosphate—ATP for short. The energy of the foodstuffs is stored in this compound, which in turn reacts with the contractile proteins of muscle, enabling them to perform work.

A problem of interest in this field is the nature of the interaction between myosin and actin, and the events occurring when ATP reacts with actomyosin. This problem is studied in the Laboratory by means of light scattering, a method which is extremely useful for obtaining information about the size and shape of protein molecules.

As mentioned above, the transfer of energy to the muscle machine occurs during the combination of ATP with the contractile proteins. We are trying to find out what happens during this interaction by working with ATP radioactively labeled in either its carbon or phosphorus atoms.

Another problem under investigation is the structure of myosin and actin. Both proteins seem to be built up of smaller units. The study of the chemical groups involved in linking the subunits together is an important step in obtaining insight into the mechanism of muscle action.

The problems mentioned above are of general interest in muscle biochemistry. Current work in the Laboratory is also concerned with specific differences between cardiac and skeletal muscle. Research along this line is directed toward comparing the two types of muscle from the point of view of the combining ratio of myosin and actin, of molecular size and shape, and of enzymatic activities.

So much for the pump, and its motor, gears, and fuel. Now we must consider the pipes leading from it. These are of equal importance, because their narrowing and blockage can be disastrous. This is the disease known as arteriosclerosis, or, in more popular terms, "hardening of the arteries". Many organs of the body can be affected by this process. As their blood supply is reduced or cut off, their ability to carry out their normal function is lost. The most serious harm to the body results when the organ involved is a vital one, such as the brain or the heart itself. If a large artery to the brain becomes obstructed, paralysis of a part of the body is apt to follow. If an artery supplying blood to the heart muscle is blocked, coronary occlusion is said to have occurred, and the heart may no longer be able to carry on its job of pumping blood to the rest of the body.

What is the cause of these disasters? We are not sure whether the primary abnormality is in the wall of the artery or in the chemical composition of the blood. At least we do know from a descriptive standpoint approximately what happens. Early in the development of the lesions, fatty deposits appear just under the inner lining, or intima, of the vessel. These grow to form large, yellow plaques which protrude into the lumen of the vessel and narrow the passageway. Later, calcium may also deposit. These lesions are often the site of formation of blood clots, or thrombi, which completely block the artery. We do not know whether the initial deposition of fat in the arterial wall must be preceded by damage to that wall. There is evidence from some animal studies that such is the case. On the other hand, abnormal concentrations of fat in the blood, or abnormal combinations of fat and protein, may be capable of producing the damage. We have elected to direct our efforts first at the chemistry of the fats in the blood, partly because we think there is a good chance that these compounds are the primary offenders, and partly because they are amenable to study with the techniques now at our disposal.

Probably the most important compound in the fatty deposits in the arteries is cholesterol. Cholesterol is present in every cell in the body. Almost every cell is capable of making it. It is also present in a normal diet, the best source being egg yolk. Cholesterol is a normal constituent of the blood. Clinical studies have tended to show that persons with manifestations of arteriosclerosis have higher than normal blood cholesterol levels, on the average. The difference is not striking, and the degree of overlap between the groups is so great that in a particular individual a measurement of the blood cholesterol is of little or no value for estimation of the degree of arteriosclerosis present. Nevertheless, the relationship is real, as is evident from statistical analysis of well-controlled groups of patients studied by Gertler, Garn, and Lerman at this Hospital.

Further support for the notion that cholesterol is important in the production of arteriosclerosis is to be found in the observation that members of the animal kingdom other than man show little arteriosclerosis, and their blood cholesterol levels are relatively low. Arteriosclerosis may be produced in animals, however, by cholesterol feeding.

With all of these facts in mind, we decided to devote a large share of our time to the question of the nature of the mechanism which controls the concentration of cholesterol in the blood. Dr. Donald S. Fredrickson has occupied a key position in this phase of the work. As stated above, human beings eat cholesterol and they manufacture it. They also burn it and excrete it. In a complicated situation of this kind, often described as a "dynamic equilibrium", the interrelated processes can be studied effectively only with the aid of tracers. Consequently, much of our work has involved isotopic techniques. We are studying cholesterol synthesis from acetic acid labeled with radioactive carbon, and from water labeled with radioactive hydrogen. We are following cholesterol absorption, excretion, and oxidation with the aid of these same isotopes. Development of techniques for the preparation of radioactive compounds necessarily preceded biochemical experimentation with them. Measurement of carbon fourteen, once considered difficult, was a routine matter when we began this work. Counting radioactive hydrogen, on the other hand, remains a tricky business which only a few laboratories have undertaken. Our ability to do it is entirely the result of the efforts of Mr. Alden V. Loud, who patiently perfected a counting system suited to our needs. We hope that eventually we will be able to give a complete description of the factors which control the cholesterol content of the body.

In conclusion, perhaps a few words are in order about the prospects of success in this effort to find the cause and cure of arteriosclerosis. Does Mother Nature hold this secret so tightly that we cannot learn it, short of complete knowledge of the workings of the cell? Such may be the case, but I am inclined to a more optimistic view. Precipitation of materials from solution is a process which is fairly well understood. Prevention of it surely is not beyond our ability.

The Cardiovascular Research Laboratory is still in its infancy. We are still trying to earn a place for ourselves in the Massachusetts General Hospital's illustrious laboratory family. If we fail to solve the problems set for us, we can say that the problems were too difficult, should we lack the courage to admit that the investigators were too inept; but I doubt if we can blame our environment.

Ivan D. Frantz, Jr., M.D.,
Assistant Physician
and *Chief Cardiovascular Investigator*

BIOGLETS

Dr. John T. Binion, Intern in Medicine—born in Commerce, Texas, March 30, 1929; B.S., East Texas State College; Research Fellow, Department of Medicine, Southwestern Medical College, University of Texas, Dallas, 1949-50; M.D., Southwestern Medical College, University of Texas, 1952.

Dr. John D. Constable, Intern in Surgery—born in London, England, June 21, 1927; educated at home and at schools in England, Switzerland, and Cambridge, Massachusetts; A.B., Harvard College, 1948; M.D., Harvard Medical School, 1952.

Dr. Ira A. Ferguson, Jr., Intern in Surgery—born in Atlanta, Georgia, September 2, 1929; A.B., Emory University, Atlanta, 1948; M.D., Emory University, 1952; home: Atlanta, Georgia.

Dr. Raymond A. Justi, Assistant Resident in Pathology—born in Mark, Illinois, September 6, 1924; A.B., DePauw University, Greencastle, Indiana; M.D., Loyola University School of Medicine, Chicago, Illinois, 1948; Intern, Cook County Hospital, Chicago, June 1948 – June 1950; U. S. Army: Captain, serving in Japan and Korea, August 1950 – September 1951; Camp McCoy Station Hospital, September 1951 – January 1952; Minneapolis Armed Forces Examining Station, January 1952 – June 1952.

Dr. Leon Reznick, Resident in Dermatology – born in Worcester, Massachusetts, November 22, 1924; A.B., Harvard College, 1946; M.D., Harvard Medical School, 1950; Intern on the Medical Service, Peter Bent Brigham Hospital, Boston, Massachusetts, July 1950 – June 1951; home: Dorchester, Massachusetts.

Dr. Kenneth J. Ryan, Intern in Medicine—born in New York City, August 26, 1926; U. S. Navy: Naval Air Corps and Submarine Service in the Pacific Theatre, 1943-46; Northwestern University, Evanston, Illinois, 1949; M.D., Harvard Medical School, 1951.

Dr. Bernard B. Stone, Assistant Resident in Neurosurgery—born in Revere, Massachusetts, April 20, 1924; Boston College, 1942-44; M.D., Tufts College Medical School, 1948; Intern, Worcester City Hospital, Worcester, Massachusetts, 1948-50; U. S. Navy: service in this country and in Korea on the hospital ship U. S. S. *Haven*, 1950-52.

Dr. Jacob Stovner, Assistant Resident in Anesthesia—born in Norway, March 14, 1916; military service: medical service with the Royal Navy, 1941-45; M.D., University of Oslo, Norway, 1947; practice of General Medicine and Surgery, 1947-49; Intern in Anesthesia, 1949; World Health Scholarship for the study of Anesthesia in Great Britain, 1951; temporary Head of Anesthesia Department, Aker Hospital, Oslo, Norway, 1952.

Dr. John B. Tallon, Assistant Resident in Radiology – born in Cornwall, Ontario, Canada, October 29, 1924; B.A., St. Michael's College, University of Toronto, 1947; M.D., McGill University Medical School, 1951; Intern, Montreal General Hospital; home: Cornwall, Ontario.

Dr. Yang Wang, Intern in Medicine—born in Tangshan, Hopeh, China, May 12, 1923; Yenching University, Peiping, 1940-41; St. John's University, Shanghai, 1942-43; M.B., National Medical College of Shanghai, 1948; Health Division, Sino-American Joint Commission for Rural Health Reconstruction, ECA, Canton, China, 1948; Fellow in Pathology, Free Hospital for Women, Brookline, Massachusetts, 1949-50; M.D., Harvard Medical School, 1952; home: Peiping, China.

Dr. Howard S. Yaffee, Assistant Resident in Dermatology—born in Brookline, Massachusetts, October 14, 1927; A.B., Syracuse University, 1947; M.D., Harvard Medical School, 1951; Intern in Medicine in the Veterans Administration, Yale University Program, at Newington and New Haven Hospitals, Connecticut July 1, 1951 – June 30, 1952.

Your editor suggested to me recently that I might like to set down a few thoughts in this column. She flattered me to the extent of adding that my words might deal with other than a strictly medical topic, thus implying that my reflections regarding non-surgical matters might interest those who chance to peruse this page. Indeed, Drs. Benjamin Barnes, Robert Shaw, Thomas Green, and George Richardson of the surgical resident staff have previously written such excellent letters that I am led to believe that surgeons are not all unschooled in the art of exposition.

As an amateur ecologist I am vitally concerned with the conservation of America's natural resources and, by the same token, with the preservation of the fair face of the land. How deep are the scars on that fair face! A glance at any billboard-bedecked highway with the view beyond obscured, or a summer Sunday spent hopscotching fragments of broken bottles littering New England's beaches, remind one that our country is not as beautiful as it once was. Yet the problem goes far deeper than appearances. A few examples will illustrate my point.

In a profligate manner we have set the land to plow in the West, producing wheat far in excess of our capacity to consume, apparently spurred on by greed and the specious economics of government parity price supports. All the while we disregarded the warnings of the soil conservationists. Today we learn that we are threatened by drought and dust perhaps more devastating than the blight of the 1930's. In areas of many Western States the natural water table has receded to below critical levels, largely a result of wasteful consumption and bad soil economy. Where range grass once grew, cattle must be fed upon prickly pears.

A large tributary to the Mississippi River was named "Ohio" by the Indians. This, translated, means "beautiful river", but the resemblance to beauty today is one in name only. Polluted by the untreated refuse from numerous industrial communities, the river has become an eyesore and a major health problem in the large area which depends upon it for water supply. Its value as a recreational facility is potentially great but actually nil, for who can imagine fishing, swimming, or boating in a sewer? Yet we are told that it is possible to dispose of the refuse of a city and the wastes of industry in more desirable ways.

The frightful industrial smogs in many areas are now an old story. Some of these conditions have been poisonous and have even resulted in loss of human life. Suffice it to say that it is not necessary to foul the air, because scientists know of safer and more esthetic ways to dispose of these chemicals and dusts, though no doubt such methods might be more expensive than the present ones. Today and in the future we are faced with a much more ominous threat of air contamination—viz, the air-borne by-products of atomic fission. One must be a physicist to comprehend fully the magnitude of the threat. We are assured that were the problem to go beyond our ability to control it, as well it might in the event of atomic warfare, there would be dire consequences for all living creatures—man included.

A last illustration of the thesis comes to mind for all of us who love hunting as a sport while maintaining a deep interest in the conservation of our wild life for future generations. Some steps in the right direction have been taken, to be sure; but the laws are so ill-conceived in many States and the regulation of those who carry lethal weapons so irresponsible that the annual harvest of the dwindling deer herds in many areas is inversely proportional to the harvested hunters.

In some other countries, I have seen that the waste of resources is not so wanton and the scars on the land not so deep. The peasant in Germany and France has tilled the same fields for 2000 years. These fields are still fertile because of wise conservation involving crop rotation, fertilization of the soil, and prevention of erosion. Truly scientific forestry and careful utilization of timber resources in Germany far exceed the general practice in the United States. Nowhere have I seen better kept or handsomer cities than in Switzerland. To litter the streets with paper and other refuse in a Swiss city is a misdemeanor which is punished by a heavy fine. In the rural areas of England one is struck by the loveliness of the countryside and the tidy way in which man has gone about his living off the land. The people seem to have a respect for the land and its resources, and for the appearance of the places where they reside.

I have been admittedly critical, and the criticism in this brief essay is not constructive. Let me hasten to add that I have often thought about what should be done to conserve our wealth of resources and the beauty of America. However, it is not now my purpose to pursue the subject further. I do believe, though, that it is the responsibility of each of us who has children to help these little ones acquire an appreciation of the beauty of the world in which they live. Children should learn to respect the land and its resources, and to feel responsible for the conservation of our natural heritage, just as they must learn to respect and heed the rights and feelings of other persons.

Clifford J. Straehley, Jr., M.D.,
Assistant Resident Surgeon

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

The third in the series of "International Teas", given by the MGH Staff Wives Hospital Committee this year, was held on March 17 in the Medical Staff Room of the Bulfinch Building. This tea, like the preceding ones, was well attended by our members and the visitors from abroad who are currently at the

Hospital. The Committee is exceedingly pleased with the popularity of these teas and will continue to hold them periodically.

All members of the Staff Wives Committee are invited to attend a morning coffee at 10:30 on Wednesday, May 6, in the living room of the Walcott House. Officers will be elected for the coming year, the annual report will be read, and Dr. Henry K. Beecher will address the meeting as guest speaker.

Dr. and Mrs. Bradford Cannon have once again offered the use of their home in Lincoln for a picnic to be given on Saturday, May 23, for the members of the House Staff and their families, as well as the visitors from abroad and their families. The picnic was a memorable event of last year, and one we are all looking forward to again.

Additional books and phonograph records are urgently needed for the House Staff Club Rooms. Please leave donations at the front desk of the White Building, clearly marked "Penthouse". They will be deeply appreciated.

It is difficult for those who come to the M.G.H. from other lands to find apartments—particularly furnished ones. Therefore, a committee has been established by Mrs. Richard H. Sweet to collect a supply of furniture for the use of those who are lucky enough to find unfurnished apartments. If you have something to contribute, please send a card to Mrs. Sweet, 27 Chestnut Street, Brookline 46, Massachusetts, or telephone her at Longwood 6-5671.

* * *

Plans have already been made for the 1953 summer courses in Clinical Pastoral Education at Massachusetts General Hospital. These courses, conducted under the auspices of the Institute of Pastoral Care, Incorporated, are now given at nine Chaplain Supervisors Training Centers in the United States. Besides the Massachusetts General, these centers include: University Hospital, Ann Arbor, Michigan; Miami Valley Hospital, Dayton, Ohio; Emanuel Hospital, Portland, Oregon; Augustana Hospital, Chicago, Illinois; and Medfield State Hospital, Boston State Hospital, Tewksbury State Hospital and Infirmary, and Worcester State Hospital, in Massachusetts. At Augustana Hospital in Chicago, courses will not be offered this summer. Additional training centers will be opened in the future in institutions having competent pastoral supervision, contributing professional personnel, and which maintain treatment programs.

Rev. James H. Burns, Protestant Chaplain at Massachusetts General, will again be in charge of the work here, which includes a course for 18 students from June 1 to July 10, and one for 12 teachers, chaplains, or clergy from July 13 to August 21.

A folder has been issued giving information on such subjects as goals, training centers, courses of instruction, eligibility, application procedures, fees, living accommodations, financial aid, and academic credit. In case you may not have seen the folder and may know of someone who might be interested, we are quoting the following from its pages:

The four primary objectives of the Institute of Pastoral Care in its Clinical Training Programs are as follows:

1. To enable the student to gain a fuller understanding of people, their deeper motivations and difficulties, their emotional and spiritual strengths and weaknesses.
2. To help the student discover more effective methods of ministering to individuals and groups and to intensify his awareness of the unique resources, responsibilities, and limitations of the clergy.
3. To help the student learn to work more cooperatively with representatives of other professions and to utilize community resources which may lead toward more effective living.
4. To further the knowledge of problems met in pastoral care by providing opportunities for relevant and promising research.

At each center the Chaplain Supervisor is in charge of all instruction. He is assisted by as many qualified associates as the enrollment may require. The ratio is five or six students per leader. Guest lecturers from each institution and its community are invited to participate in the scheduled seminars. While the programs at the centers vary in content, depending upon the nature of each institution, all utilize the clinical approach of actual work with people under pastoral supervision, such work being recorded and submitted to the Chaplain Supervisor and his associates for constructive evaluation and class instruction. Selected books and articles are assigned for reading and review. Ample opportunity for personal conferences is provided. The daily schedule requires approximately eight hours of attendance at the training center. Ordinarily there are neither evening assignments nor night classes, and all students are usually free on Saturdays and Sundays.

All applicants shall be enrolled in or alumni of seminaries or other accredited religious training schools, or shall have had a minimum of three years of professional religious work, or shall present other similar qualifications. In those centers where two sessions are offered, enrollment in the second is usually restricted to persons who have had previous training or professional experience. In order to provide an ecumenical group, ordinarily not more than one-third of the total enrollment in any session shall be from one denomination or faith. . . .

The tuition charge at each center is $60.00 for a six-weeks' session and $120.00 for a twelve-weeks' session. A deposit of $5.00, which is later applied to the tuition cost, must accompany each application. This deposit is returned only if the applicant is not accepted. . . . All checks should be made payable to the specific Chaplain Supervisor of the center where training is desired.

While a few centers are able to provide room and board in return for some limited service to the institution, in most centers the cost is assumed entirely by the student. Full information concerning living arrangements will be supplied *upon request* by the Chaplain Supervisor. Final plans, however, shall be made by the student.

Applicants who desire local preaching appointments or supply work should communicate directly and in advance with their denominational representatives. In some areas scholarship grants can be secured through a local seminary or denominational office. These arrangements, however, must be made by the student. . . . Clergymen who have had previous clinical pastoral training may apply for appointments as Course Assistants or Clinical Associates. A few teachers of pastoral care, parish ministers, and chaplains, as well as students enrolled in the four seminaries affiliated with the Institute (Andover Newton Theological School, Boston University School of Theology, Episcopal Theological School, and Harvard Divinity School) are eligible for scholarship aid through the Institute of Pastoral Care.

Upon receipt of certification from the Institute of Pastoral Care most seminaries and theological colleges grant three to six credits for each six-weeks' course. If credit is to be requested the student should make arrangements with his seminary for Institute certification to be accepted, before he applies to a Chaplain Supervisor for admission to a training program.

Copies of the folder from which we have quoted may be obtained from the office of Rev. James H. Burns, on the second floor of the Moseley Building.

New addresses:—

Dr. Robert K. Brown (*W.S.* 1939), 1624 Gilpin St., Denver 6, Colo.
Mr. A. L. d'Abreu (v.s. pro tem 1951), 12 Church Road, Edgbaston, Birmingham 15, England.
Dr. Roderick Heffron (*E.M.* 1931), The Commonwealth Fund, 1 East 75th St., New York 21, N. Y.
Dr. Alfred O. Ludwig (*E.M.* 1932), 82 Marlborough St., Boston, Mass.
Dr. S. Forrest Martin (*Oph.* 1938), 165 Bay State Road, Boston, Mass.
Lt. Walter T. St. Goar, MC, USAFR (*M.* 1950), Gunter Air Force Base, Montgomery, Ala. (from Mar. 23 until May 1).
Dr. William J. Shriber (a. *M.* & a. *Phys. M.*), Beth Israel Hospital, 330 Brookline Ave., Boston, Mass.
Lt. Roger E. Wilcox, MC, USAR (*S.* 1949), 8063 MASH, APO 301, c/o Postmaster, San Francisco, Calif.
Dr. James B. Wyngaarden (*M.* 1949), National Heart Institute, National Institutes of Health, Bethesda, Md.

Brief bits:—

Dr. William P. Beetham, Surgeon in Ophthalmology at the Eye and Ear Infirmary, recently attended a symposium on medical ophthalmology at the New Orleans Academy of Ophthalmology, where he gave three lectures on diseases of the outer eye as related to general disease, and participated in five round-table discussions.

Dr. Walter S. Burrage, Associate Physician and Head of our Allergy Clinic, and Dr. John W. Irwin, Clinical and Research Fellow in Medicine, addressed the 9th Annual Meeting of the American Academy of Allergy, held in Boston in February. The subject of the address was "Microscopic observations of the pulmonary circulation of living mammals before and during anaphylaxis". Dr. Burrage is the president of the Academy.

Dr. Irwin and Dr. Burrage presented a colored moving picture, demonstrating microscopic observations of the pulmonary circulation of arterioles, venules, and capillaries of the mammalian lung, before the American Association of Anatomists at the Annual Meeting in Columbus, Ohio, on March 25.

Dr. Grantley W. Taylor, Visiting Surgeon on our Staff, has returned from Paris and Morocco where he was invited to speak on the subject of cancer before the Société de Chirurgie de Paris and the Société de Médicine du Maroc.

This letter—and a fine one it is—has come in response to our "singleton" letter sent to Dr. Lawrence K. Lunt (*W.M.* 1916), the only MGH-er practising medicine in the State of Wyoming. From Double Four Ranch, Wheatland, Wyo-

No. 39 in a series of Staff photographs
Dr. Ivan D. Frantz, Jr., Assistant Physician and Chief Cardiovascular Investigator

ming, Dr. Lunt writes:

I am very sorry to have been so long in answering your request from this solitary MGH-er in Wyoming. It has not been from neglect, but because I have hoped I might find something of interest to write about.

From the medical point of view, there is little I can report at first hand, except the general impression that there are some excellent doctors in the State and some mighty poor ones, which holds true of any State in the Union! The State Health Department is headed by a very active and excellent man, Dr. Franklin D. Yoder. The State Society and the State Board of Medical Examiners are doing a fine job of keeping medical standards up to a high level. Except for the few relatively large cities, practice is of the rural type, each doctor having to do most everything and, in many instances, doing it well. As we happen to live pretty well off the beaten track (35 miles from town) and in the mountains, reached over not too good roads, and with always something that seems to require doing, I have shamelessly neglected attending any medical meetings, but I understand they are of good quality and are generally well attended.

As in several Western States, osteopathic physicians are represented on the State Board of Medical Examiners, so are legally licensed to practise. It has surprised me how many people swear by chiropractors—people of whom one would expect more discrimination! Possessing the title of "Doctor" out here raises the question as to what kind—osteopathic, chiropractic, or some other strange cult—or, more legitimately, veterinary.

There is still plenty of room for improvement in the understanding on the part of physicians with an M.D. of the many kinds of human illness requiring a knowledge of and sympathy with the effects of emotions on physiological processes.

In order to be of whatever use possible, I have kept my license to practise, but this is confined to rare emergencies and to having a supply of medicines on hand, especially antibiotics, to use when a neighbor comes in or calls me out for some malady. We are in a tick area and I have seen several cases of Colorado tick fever, my wife and my son and I having had it. It is relatively mild, not leaving any sequelae, lasting a week or so with characteristic ups and downs of temperature, but with an aftermath of general misery for two or three weeks.

Diseases of cattle have interested me, finding them in many instances not unlike those of humans. It surprised me, though it shouldn't have, to find that all the newest medicines—sulfas and antibiotics—are extensively and effectively used on livestock. Many animals, like humans, are now saved where formerly they could not have been. Though the veterinary medicines are a bit cheaper than those for human use, the treatment is quite expensive because of the correspondingly larger doses needed. Veterinary Medicine is closest to Pediatrics in that it is impossible for the animal under treatment to verbally cooperate as to location and nature of symptoms!

Some years ago, I remember a colleague retiring and taking up farming in New Hampshire. It seemed to me a strange thing to do, and I fear I was rather censorious. Yet here am I, doing much the same thing and loving it! Being able to be out-of-doors much of the time, having animals about to observe, horses to ride, deer so plentiful they constitute at times almost a nuisance, beaver in one's front yard (fascinating, but annoyingly destroying one's best and most beautiful trees and having to be trapped), plenty of fresh air, lots of time blowing by at a high rate of speed, not too many periods of real cold and only occasionally more than a few inches of snow, never any oppressive heat, cool nights all through the summer—it all adds up to what seems to be, to this family, a pretty satisfactory way to live.

Our older son, after serving through the war in the Air Force out in the Pacific, elected to become a rancher and since his return from a second tour of duty as Radar Observer, again in the Pacific (Japan), has settled down with us. The younger son, after some years of thinking he was going to be a rancher, switched to medicine and is now in his third year at P & S (Columbia). Till now he has been able to spend vacations here, enjoying the ranch work but more than satisfied with his objective. Both boys have been more or less bitten with the rodeo bug and have tried their luck, unsuccessfully, on the bare-back broncs and the Brahma bulls. It has been interesting to find how many men and boys are preoccupied with this sport—and a real sport it is, and how absorbed they become in it, just as others become absorbed in golf, tennis, or sailing. The rodeos in the small towns are far more fun and interesting than the big shows, and one sees almost as much skill and finesse in them.

We have enjoyed having our daughters and their families visit us, and many friends find their way over the confusing roads (so called) to our valley. We like to think we will have much more of the same enjoyment—more than we would be allowed in the normal course of things. On the whole, not a bad way to spend one's time—new and interesting situations, new problems, old pleasures renewed, and learning that it is more sensible to play along with the changing seasons than to fight against the inevitable.

Good luck to you and The News.

This report has arrived from Dr. William N. Christenson (*M.* 1949):

Early in January I was released from active duty with the Navy, and have returned to civilian life as an assistant resident on the Medical Service at the New York Hospital. Please change my address for The News to 525 East 68th Street, New York 21, N. Y.

A short note has come from Dr. Ellsworth H. Trowbridge, Jr. (a.r.p. *N.* 1940), which reads:

I am still located in the Bryant Building, 1102 Grand, Kansas City 6, Missouri.

Besides maintaining a laboratory in the office suite, I am in charge of the brain wave laboratory at the University of Kansas Medical School and have established a new laboratory at Menorah Medical Center.

This note has come from Dr. Leland F. Carter (*Oph.* 1926):

Have just returned from the West Indies cruise of the Pan-American Association of Ophthalmology—a most delightful way to soak up sunshine, renew old friendships and make new ones (including the distaff), and to learn plenty!

Sorry none of the boys from Boss-ton were along, but I met many Eye and Ear Infirmary alumni from elsewhere.

I enjoy The News in all its departments.

A letter from Dr. Bernard G. Stall, III (*M.* 1947) says, in part:

Enclosed is my subscription to The News. This act represents the culmination of three years of intention.

Please note my change of address to Medical Department, Brookhaven National Laboratory, Associated Universities, Inc., Upton, Long Island, N. Y. After reverting to an inactive military status (Oct. 31, 1952), I began work here in association with Dr. Lewis K. Dahl (c.r.p. 1947). Recently we were joined by Dr. George C. Cotzias (*M.* 1944). Therefore, it would seem that we constitute a rather pure MGH metastasis in this isolated scientific community.

THE NEWS

No. 123 Boston, Mass. May 1953

MASSACHUSETTS EYE & EAR INFIRMARY

In the years since the war, research has become an increasingly important function of the Massachusetts Eye & Ear Infirmary. Through this Hospital's affiliation with the Harvard Medical School and close association with the research being carried on at the Massachusetts General Hospital, investigations here into the causes of blindness and deafness are a part of a much larger research effort than would be possible in one institution operating alone. In this fertile environment, the staff of the Infirmary serve as consultants in ophthalmology and otolaryngology for all units and often collaborate with them in specific projects. With larger funds available from Government agencies, the amount expended on research at the present time represents a sizable percentage of the total Hospital budget.

Because of this rapid growth, the Board of Managers recently decided to consolidate the two existing research committees into one combined Committee. This new Committee will have the responsibility for the over-all policy of the total research being carried on in the Infirmary. Mr. William H. Claflin, III, representing the Board of Managers, was made Chairman; the Chiefs of Services, the Dean of the Medical School, the Director, and the staff members active in research are also on the Committee. Dr. Robert L. Berg acts as Executive Secretary. The following serve on the Committee:

Mr. William H. Claflin, III, Chairman
Dr. LeRoy A. Schall
Dr. Edwin B. Dunphy
Dr. George P. Berry
Mr. Francis S. Hill
Dr. Moses H. Lurie
Dr. Philip E. Meltzer
Dr. Herman J. Sternstein
Dr. George Kelemen
Dr. Francis L. Weille
Dr. David G. Cogan
Dr. Charles L. Schepens
Dr. Merrill J. King
Dr. Parker Heath
Dr. William Stone, Jr.
Dr. Robert L. Berg, Executive Secretary

In addition to the responsibility for general policies, the Committee will function to relieve the investigators of many administrative burdens relating to the non-scientific aspects of their projects and should also be able to assist them in obtaining research funds. It will be a means of intercommunication between investigators and should stimulate the exchange of ideas among the various groups.

As adequate space for research has been one of the major problems at the Infirmary for some time, the Committee will be actively concerned with the planning of a new research building into which all units, now widely separated, can be brought together. Several areas have been under consideration for the construction of this building, which necessarily will have to be adjacent to the Infirmary clinics, but, at the moment, no definite decision has been possible.

In the past, the social implications of blindness and deafness never have been properly appreciated by the public, and far too little has been done to find and remove the causes of such crippling handicaps. Literally, millions are expended annually in caring for the blind and the deaf, but pathetically little, until recently, has been given for research into the cause and cure of either. As there are comparatively few eye and ear centers in the country, the Infirmary feels a tremendous responsibility in providing facilities for productive research.

One of the great challenges for research here can be illustrated by the increasing incidence of the comparatively new disease of retrolental fibroplasia, which was first described by the late Dr. Theodore Terry at the Infirmary in 1942. This disease, which occurs primarily in premature babies, has spread so widely that it is now regarded by many to be the principal cause of blindness in infants.

As an example of the seriousness of this disease, over 300 of these children have been followed in the Infirmary clinics during the last few years. At the Perkins Institution for the Blind, the first cases of children blinded by retrolental fibroplasia were admitted in the fall of 1945 — 3 of 54 admissions. Since then their enrollment of such cases has steadily mounted so that, between 1945 and 1952, they have admitted 96 children with retrolental fibroplasia. In the fall of 1952, more than one-half of the new admissions were such cases — 19 of 36 admissions.

The Infirmary has been searching for the cause of this disease since 1942, and at the present time is collaborating with Boston Lying-in Hospital and the Children's Medical Center. As many groups throughout the country are now investigating the disease and reporting their findings, it is hoped that the combined efforts of a coordinated nation-wide research program will prove successful in combatting retrolental fibroplasia in the not too distant future.

This particular research program is not necessarily more important than the other interesting work going on in both services of the Hospital. For example, the clinical study of pressure-regulating mechanisms in glaucoma being carried out in the Howe Laboratory is of tremendous importance because of the large number of people suffering from this disease. The aim is to discover more about the cause of glaucoma and to improve the treatment of this condition. Tonography, a method of measurement developed in the Howe Laboratory, has been found to be an indispensable adjunct to existing methods of clinical examination.

The Howe Laboratory is also studying the effects of ionizing radiation on the lens. This is being done currently in two ways: first, by contacting all persons who have received a known amount of x-ray through the eyes, incidental to x-ray therapy of the head region, and re-examining their eyes; and secondly, studying the opacification of the lens in rabbits exposed to various doses of x-rays and neutrons.

At the Retina Foundation, a study of the fine structure and chemical properties of the vitreous body and tissues of the eye is in progress. This group is also working to improve the mathematical methods for computing optical instruments, in order to make better instruments for use in the examination and treatment of cases of retinal detachment.

Then there is the work of the Winthrop Foundation, which for a number of years has been studying the influence of the lymphoid tissues of the nasopharynx on the Eustachian tube as a cause of deafness, particularly in children. The Foundation is also investigating the effect of x-ray or radium upon these tissues, as it bears upon the improvement of hearing.

The recently initiated study on atrophic rhinitis was brought into being from the need to evaluate new methods of treatment for this troublesome disease. Another comparatively new research project is the work on cold virus — a study which we hope will add to the sum total of knowledge being brought to bear against the common cold.

These projects, picked at random, are mentioned primarily to show the great need for a specialized hospital whose staff is interested, not only in basic research, but in the specific problems of otolaryngology and ophthalmology.

Francis S. Hill,
Director

Mrs. Paul Doehler, teacher of the Esophageal Voice classes held at the Infirmary, has been chosen to enter a nation-wide contest to honor the handicapped individual who has done most for other handicapped persons. Mrs. Doehler has been nominated as a candidate by the Massachusetts Division of the American Cancer Society, which sponsors the Boston voice classes, and by the Rhode Island Division, as Mrs. Doehler also teaches speech classes in Providence.

Mrs. Doehler has been teaching Esophageal Voice classes at the Eye and Ear since 1944. Some ten years ago it became necessary to remove her larynx because of cancer. When she found herself faced with the loss of normal speech, she consulted with Dr. LeRoy A. Schall, Chief of the Ear, Nose and Throat Service. He told her of a new theory of esophageal speech for the laryngectomized which, unlike former methods, used no mechanical devices to aid in speaking. Mrs. Doehler got in touch with the man who was exploring this new method, and very soon she had mastered the basic technique of swallowing air and causing it to vibrate against the esophagus, to produce sound without vocal chords.

Before her operation, Mrs. Doehler had been an English teacher. She had studied speech therapy, phonetics, and voice training. In teaching remedial reading, she had worked with those who had speech difficulties. It was not long after her operation when Mrs. Doehler developed an esophageal speech method that capitalized on her previous knowledge. By proper use of the lips and tongue and teeth, she herself mastered, and now teaches her students to acquire, a new voice which, although somewhat husky, has clear enunciation and good tone quality.

Mrs. Doehler now devotes her entire time to teaching laryngectomized patients and has already taught 600 men, women, and children to speak again. Last summer she was elected Secretary of the International Association of Laryngectomies at their first meeting in Cleveland, Ohio. Very recently she completed a manual, setting forth her methods of instruction in esophageal voice. To be published under the aegis of the Cancer Society, Massachusetts Division, this will present for the first time a textbook that can be used by teachers and patients.

The Annual Meeting of the Eye and Ear Alumni Association was held on April 14 and 15 at the Infirmary. Morning sessions were devoted to surgical clinics and presentation of cases; the afternoon and evening sessions to papers.

The Alumni Dinner was given on the evening of April 15 at the Harvard Club. Dr. Thomas Davis had been invited as guest speaker. He gave a lecture, with motion pictures, on a trip "From New Zealand to Boston by ketch".

The Boston Eye Bank will give the first hospital showing of the organization's new motion picture on May 12. The film explains the program of the Eye Bank through the story of one patient's corneal graft operation. Designed primarily for the lay public, it presents the work of the Eye Bank so that the prospective donor will understand just how a gift of eye tissue after death can be used to restore sight.

The film — in color and sound — was made at the Eye and Ear in March. It was produced by Sturgis Grant & Company, who several years ago filmed *They speak again*, a brief documentary on the Infirmary's Esophageal Voice classes. The Junior League of Boston sponsored the new picture.

Eyes of service will be available to community groups free of charge and is expected to play a large role in publicizing the work of the Eye Bank. Such lay education is essential, since only the active interest and cooperation of the public make this program possible.

The picture will be shown both in the morning and in the afternoon on May 12 — Hospital Day — at the Infirmary. All who are interested are most cordially invited to attend.

Dr. Joseph S. Barr is in Indonesia with a group of medical scientists. The team is under the auspices of the World Health Organization and the Unitarian Service Committee. Dr. Frederick J. Stare, Professor of Nutrition at the Harvard School of Public Health, is the other New England member of this international team.

Dr. Henry K. Beecher has been appointed by the Secretary of the Navy to be Honorary Consultant to the Surgeon General of the Navy.

Dr. Benjamin Castleman spent two weeks in March as Visiting Professor of Pathology at the Universidad de San Carlos de Guatemala in Guatemala City, where he gave a series of five lectures and three clinico-pathological conferences under the auspices of both the university and the Colegio de Médicos y Cirujanos. He had a chance to put "Rudy" Herrera (*E.S.* 1943) on the mound in his home field.

Dr. and Mrs. Castleman were house guests of Dr. Pablo Fuchs, who spent a year on the MGH Surgical Service during the war and who now is a professor of surgery and one of the foremost surgeons in Guatemala.

In addition to being royally entertained and given a chance to see many parts of the country (and it really is "the land of eternal spring"), Dr. Castleman was honored by being made an Honorary Professor of the University and an Honorary Member of the Juventud Médica — a student organization similar to the Boylston Society at Harvard.

At the meeting of La Société de Chirurgie de Lyon [France] on January 29, Dr. Edward D. Churchill was elected Membre D'Honneur Étranger.

Dr. Nathaniel W. Faxon is Acting Director of Mount Auburn Hospital, pending the selection of a new Director.

The Board of Trustees, at their meetings on March 20 and April 3, voted:

To promote Dr. Claude E. Welch to the position of Visiting Surgeon, effective as of February 20;

To change the appointment of Dr. Frederick E. Whiskin from Resident to Assistant Resident in Psychiatry, beginning July 1, 1953, and Resident as of January 1, 1954.

To appoint:

Dr. John F. Brock as Visiting Physician pro tempore, for the period May 11 through May 16;

Dr. Charles R. Campbell as First Assistant Resident in Pathology for the year beginning July 1, replacing Dr. Hanna Klaus;

Dr. Henry H. Faxon to the Board of Consultation;

Dr. Leland S. McKittrick as Consulting Visiting Surgeon, as of July 1;

Dr. George F. Odland as Assistant Resident in Dermatology for one year, beginning July 1;

Mr. E. Michael White as Assistant Director and to assign him as administrative head of the Out-Patient Department. Mr. White will continue to serve as Director of Organization of the Massachusetts General Staff Associates.

To appoint the following Medical and Surgical Interns for the year beginning July 1:

Medical

Charles G. Barnett
Zanvil A. Cohn
Daniel D. Federman
Howard S. Frazier
Lamont W. Gaston
David J. L. Luck
Robert F. Moore
Stuart H. Mudd
Joseph R. Petranek
Harvey D. Rothberg, Jr.
Jan Wolff
Donald N. Wysham

Surgical

Edwin L. Carter
Harry B. Ditmore, Jr.
Edward L. Ferguson
John A. Mannick
Harold L. May
Jens G. Rosenkrantz
Edwin W. Salzman
George D. Zuidema

To appoint the following to the Ladies' Advisory Committee to the School of Nursing:

Mrs. Lloyd D. Brace	three years
Dr. Dean A. Clark	three years
Dr. Rita M. Kelley	three years
Mrs. Van Courtlandt Elliott	five years
Mrs. Harris Fahnestock	five years

At their meetings during March and on April 1, the General Executive Committee voted:

To promote:

Dr. Earl M. Wedrow from the position of Assistant Resident to that of Resident in Psychiatry, beginning July 1.

To reappoint:

Dr. Fa-Chi Dunn as First Assistant Resident in Dermatology, for the year beginning July 1;

Dr. Leon Reznick as Resident in Dermatology, for the year beginning July 1.

To appoint:

Dr. Jacques Y. Chatillon as Clinical and Research Fellow in Medicine for one year, beginning March 11;

Dr. Nechama deShalit as Clinical Fellow on the Children's Medical Service for one year, beginning March 19;

Dr. Jacques O. Gagnon as Clinical Fellow in Medicine, beginning July 1;

Lt. Col. George W. Geiss as Clinical Fellow in Physical Medicine, beginning April 1;

Dr. William E. Reynolds as Clinical and Research Fellow in Medicine, for the period March 15 through December 31;

Dr. Samuel R. Schuster as Clinical Fellow in Pathology, for a period of six months, beginning July 1;

Dr. Robert B. Sloane as Resident in Psychiatry, for the period April 1 through June 30.

At an earlier meeting the General Executive Committee voted:

That Dr. Leland C. Brannon be appointed as Clinical and Research Fellow in Neurosurgery for the period January 1 through June 30, and that his appointment as Assistant Resident become effective July 1.

* * *

BIOCHEMISTRY LABORATORY

The biochemical approach has more and more become the dominant avenue leading to the understanding of living organisms and of the processes by which they perform such functions as we attribute to the living state. Zoology, botany, genetics, microbiology, and that composite mixture of all of them, medicine, are recognizing more and more the central position of biochemistry. Although each of these branches of the biological sciences has its own peculiar biochemistry, there is a general pool of biochemical phenomena which is common to all living things. It appears proper, therefore, that in an institution like ours, there exists some center doing pure fundamental biochemistry aimed at the general understanding rather than at a special application. Our biochemical research group thus represents an ideological center for the various more or less applied biochemical activities occurring all around in clinical departments and in the research laboratories of our new Research Building.

What are we more precisely doing in our "lofty" region on the fifth floor of the Research Building? From the early beginnings with Dr. Cope on White 4, through our more extensive activities on the top floor of the Bulfinch Building, we have been developing and mapping a relatively new field of biochemical research concerned with the synthesis of body material — the study of biosynthetic mechanisms.

The constant need for energy supply is one of the most fundamental characteristics of all living beings. Cellular respiration or, more specifically, the burning of foodstuffs, has long been known as a main source of energy. However, how this initial combustion is converted into useful energy has been one of the stubbornly evasive problems which has long puzzled the biochemist.

The over-all metabolism of an organism may be understood as an interplay of breaking down and building up. Since it is generally easier to break down than to build, it was also easier to understand how such functions as, for example, intestinal digestion, occur: Food is broken up through specific agents, biocatalysts, or enzymes which gently cleave apart large particles to smaller and smaller units. These reach the blood stream through the body cells. There they are burned partly and used partly for building or rebuilding the ever changing organism. Our understanding of the mechanisms involved in this building up of body material has started to develop only during the last two decades, first slowly and now recently with considerable speed.

Of great importance for the advance in this new field has been the realization that vitamins are more essential parts of many biosynthetic enzymes. The whole family of the so-called "B-vitamins" represents to the biochemist a variety of peculiar chemical compounds which the animal is shy of synthesizing, but rather imports from the outside. Thiamin, nicotinic acid, riboflavin, pantothenic acid, biotin, and others respectively form the core of enzyme systems which fulfill very special metabolic functions. In the form of a particular "coenzyme", every one of these vitamins covers a certain metabolic territory. The first vitamins, the territory of which was mapped out, were thiamin, nicotinic acid, and riboflavin. This happened in the middle and later thirties. After that we had to wait for quite a while for a new metabolic function to become related to one of these peculiar vitamin molecules. In 1945 it was our good fortune, through a number of fortunate accidents, to uncover the metabolic function of pantothenic acid. During our work on the acetylation of sulfanilamide, we became aware of the existence of a new coenzyme. Together with Tuttle, Kaplan, Novelli, Gregory, and an ever changing and increasing group, this new coenzyme was isolated and found to contain pantothenic acid, adenylic acid, and a sulfhydryl-containing part, thioethanolamine. We called it "coenzyme A" (CoA), indicating that it carries Acetic acid and, more generally, various organic Acids.

Acetic acid, the acid of the common vinegar, has lately attracted considerable attention among biochemists, as it developed to be a major building stone for biochemical structures. Isotope research long had uncovered the amazing role which "active" acetic acid (or, as it frequently is called, the "active 2-carbon fragment"), plays in the building of large carbon structures. The chemical identity of this active acetate remained a mystery for a long time. We now have identified it as Acetyl-coenzyme A. It is the function of CoA to carry acetyl groups in reactive form. It performs this subtle function by picking up the active 2-carbon fragment during the respiration of carbohydrate and of fat. Acetyl-CoA in various ways brings forth the construction of the long straight carbon chains of fatty acids or the branched and ring structures of the steroids. The role of CoA in cholesterol and steroid synthesis and particularly the relationship of CoA to adrenal function has recently attracted considerable attention. Dr. Klein in our laboratory has contributed much to the understanding of this field by correlating the CoA content of the cells with their ability to synthesize steroids and fatty acids.

Aside from these specialized studies, we always continued with our general interest in metabolic energy transformation and in the utilization of this energy for biosynthesis. The "acyl transfer" which we just discussed is only a particular type of group and energy transfer. The general problem of energy metabolism was earliest understood, however, in the case of phosphate bond generation. Phosphoryl groups or "energy-rich phosphate bonds", as we proposed to call them, like active acetate, are generated metabolically in various processes by fixing phosphate in energy-rich bonds and by using phosphate as an energy catalyst. As an extension of this early theory of energy utilization, the interplay between phosphoryl and acyl transfer has now become of paramount interest for the understanding of the energy transformation picture in general. Lately, we have become most interested in aspects of energy transfer in animal cells relating to the function of the thyroid hormone.

Recent studies by Dr. DuToit and Dr. Hoch in this laboratory brought out certain features of the cellular action of thyroxine, characterized by direct effects of the hormone on intracellular processes of energy transfer. We are entering therewith into the field of hormone biochemistry, which has so far proved much more difficult than the understanding of the function of the vitamins. The hormones, as we see it, act on a secondary and regulatory level. Our understanding of this action presupposes the understanding of the primary or catalytic enzyme level. Our recent limited success with the thyroid hormone makes us now hopeful that sooner or later the biochemist may be able to break open the hormone field in a fashion similar to the opening up of the vitamin field.

Then we might hope to bridge the gap which at the present time, we feel, still exists between the biochemist and the clinical investigator. The clinical investigator is working downward from the level of highest complexity. The biochemist is working upward from the levels of isolated enzyme systems. They have to meet eventually somewhere in the middle. It is one of our main functions in this Hospital community to work toward achieving this junction on the broadest possible basis.

Fritz Lipmann, M.D.,
Biochemist

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

Your title should be classified with respect to subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to The News.

The following new titles have been received:

Dermatology

Lever, W. F.
Pemphigus.
Medicine 32:1-123.

General Medicine

Harwood, R.
Results of a screening program for diabetes mellitus.
Diabetes 2:43-46.

Laboratory Science

Lever, W. F., and Hurley, N. A.
The plasma glycoproteins and lipoproteins.
In Blood cells and plasma proteins, J. L. Tullis, Editor, New York, Academic Press, Inc., pp. 392-403.

Roque, A. L.
Chromotrope aniline blue method of staining Mallory bodies of Laennec's cirrhosis.
Lab. Invest. 2:15-21.

Neurology, Neurosurgery, and Psychiatry

Lorenz, M.
Language behavior in manic patients: A qualitative study.
A.M.A. Arch. Neurol. & Psychiat. 69:14-26.

Pathology

Canada, W. J., Goodale, F., Jr., and Currens, J. H.
Defect of the interatrial septum, with thrombosis of the pulmonary artery: Report of three cases.
New England J. Med. 248:309-316.

Books

Swartz, J. H.
Dermatology in general practice.
Baltimore, The Williams and Wilkins Company.

Having become one of the "old-timers" on the House Staff, I have been invited by our editor to fill up a column or two with whatever ideas or thoughts might come to my mind. This was taken to be a *carte blanche* and, accordingly, my remarks will not be confined to strictly scientific channels. With so many physicians departing for military service or anticipating a future call to duty, I thought it might be well to draw upon my vast military experience in order to explain some of the idiosyncracies and niceties of the soldierly way of life. These sage words are not directed at the bulk of new Army physicians, but rather at that rare exception who finds military life to be somewhat different from the former mufti-clad existence.

After receiving the glad tidings that you have passed the extremely stringent physical requirements as well as the educational qualifications, your glee will know no bounds. With Panglossian optimism, your immediate response will be to run into the street and embrace the first colonel you meet, explaining breathlessly that you have just entered the Army and are ready to straighten things out. A careful survey of this problem has shown the need to curb this impulse.

Probably the most important aspect of military life in any land is "the wearing of the uniform". When your final orders to active duty arrive, you will desire a handsome new uniform in which to appear at your first duty station. Very commendable! However, remember that as a military physician you have a certain tradition and reputation to uphold. The regular "line" officers will expect this and will, I am sure, be quite miffed if you let them down. Thus, one or two buttons on your jacket should remain unfastened at all times. Further, a red carnation is appropriate on this occasion, since it really is "Change Day". Forgetting one's overseas cap once or twice a week at formation is definitely mandatory, but, actually due to oversight, was not mentioned in the most recent edition of the *Officers' Guide*. Also, don't be bluffed by your fellow officers into the error of polishing those four little brass "do-dads" on your jacket, as they are meant to look dull and distinguished. However, one should make a conscious effort to remember to put on at least two or three of those four insignia when one is out in public. Some generals do check on this point every so often.

Official military orders are very interesting documents and, to the novice, might be a subject of some bewilderment. If you keep in mind several important points they will present no obstacle and your equanimity will be restored. First, all words, including those of one letter, are abbreviated. The orders themselves are written in code — a code which the cryptography branch in the Pentagon has almost succeeded in breaking. Finally, the destination on your orders is usually a spurious one in order to keep our troop movements under a veil of secrecy. You will soon become aware of this by actually going to the place mentioned in your orders. There the adjutant will invariably show utter surprise and amazement upon your arrival, and insist that there is no position for another officer in that particular battalion. Actually, this usually turns out to be a rather charming interlude for you — a four- or five-day vacation, while headquarters is frantically wiring about to find out what the devil you are doing there. A thorough knowledge of local beers is often obtained under these circumstances.

Most Army surgeons will agree, I believe, that one of the most beguiling experiences in their careers was the six-weeks' Orientation Course at Fort Sam Houston, Texas. This course was set up several years ago in order that Regular Army officers might become aware of the hazards involved in dealing with medical officers. In addition to becoming cognizant of military customs, tradition, and usage, the embryo officer also learns the art of map reading in a most thorough fashion. It has been said that physicians are better map readers as a group than artillery or infantry officers. One of the jolliest evenings of your stay in Texas will be spent on the so-called "night problem". You will be sent out into some wooded reservation with map, compass, and instructions, to walk by midnight a certain number of miles through enemy lines to a rendezvous area. Some physicians have returned to camp several days later, arriving by Greyhound bus. Despite our protestations, the authorities have been unwilling to admit their errors in the preparation of these maps and continue to keep them in use. I suppose you will face this same military intransigeance when you go through this course.

Prior to departure overseas, you will be allowed to go through an Infiltration Course — a singular event and one which should always be cherished in your memory. The main point in this exercise is to escape with your life. Apparently some sergeants, who are disappointed candidates for O.C.S., man a group of machine guns, with the object of satisfying certain sadistic needs as you crawl several hundred yards before them, beneath barbed wire entanglements. To prevent your drowsing off from the sheer boredom of the situation, charges of TNT are set off in close juxtaposition to your location. Rather than risk injury to body or clothing, it often is wiser to find a small hole in the course and relax there with a good book until the gunners run out of ammunition. Being acquainted with "One-Upmanship", certain infantry officers have been known to release copperheads into the area to mobilize some of the slower moving candidates.

Having satisfactorily completed this introductory period, you will be sent to your first permanent duty station. One of the most magnificent sights in military life is that of the new officer reporting in officially to his commanding officer. This is a very formal scene in which the junior officer very erectly and smartly marches in, snaps to attention, and shouts out, "Lt. Cronkhite reporting for duty, Sir, as directed by the War Department, Sir." Since you are a medical officer, however, the "line" officer will try to confuse you by suddenly proffering his hand while you are involved in one of those snappy cinema-type salutes. Stick to your guns! Remember, you can court-martial the blighter if he does not respond to your salute.

How to address one's colonel has always been somewhat of a ticklish problem. As a rule, when alone with him it is best to call him "Sir" or "Colonel". While talking about him with fellow officers, he is usually referred to in a somewhat more colloquial fashion. In any formal ceremony, particularly when a general is within earshot, you will find that you can make him pleased as punch by addressing him as "Colonel, old chou".

N. Swartz, M.D.] **Anon.**

⁂

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

There will be two choral concerts, held in the Moseley Rotunda in May, in the series arranged by the MGH Staff Wives Music Committee.

On Thursday afternoon, May 7, at 3 o'clock, the Morning Chorale will present an interesting program. This group of twenty-eight women is composed chiefly of homemakers and busy mothers. Under the competent professional direction of Mary Loud, they sing primarily for their own pleasure. However, they are conscientious and devoted music-makers, as all who heard them in the Rotunda at Christmastime will remember, and they enjoy sharing their accomplishments with others who enjoy good music.

On Wednesday, May 27, at 3 o'clock, the Technology Matrons and Dames Choral Group will present another program in the Rotunda. The wives of faculty members and graduate students from Harvard and M.I.T. sing under the direction of Mrs. George Scatchard, Associate Professor of Music at Smith College. These thirty-five women also sing for fun, but share their fine music by giving five or six concerts each year in the Greater Boston area.

These concerts, which were begun in the fall, will continue through June. While priority in seating in the Rotunda or the Chapel is given to our patients, all others who are interested are cordially invited to attend.

Distaff Club

Minutes of the March meeting of the Distaff Club:

On Thursday, March 19, the Distaff Club had a very successful business meeting with its president, Mrs. Thomas Peebles, officiating and forty enthusiastic members participating.

The following Bylaws to the Constitution were voted upon and approved by the members:

Article I
Section II

Its members shall consist of the wives of our house staff, women physicians, wives of clinical and research fellows, Staff Wives who wish to remain in the Club, and such others as this group shall approve by majority vote.

Article III
Section I

The officers shall consist of a president, vice president, secretary, treasurer, and service representatives; this group as a whole to be referred to as the Executive Committee, and shall meet at the discretion of the president.

The following Amendment to the Constitution was approved:

One service representative shall be appointed to each service by the president to act, together with the officers, as an executive board, to direct such policies and activities as seem reasonable. Also, they shall have authority to vote expenditures whenever they deem it necessary for the benefit of the group.

Service representatives appointed at this meeting are as follows:

Anesthesia	Mrs. James Hepburn
Dentistry	Mrs. Robert Lincoln
Medicine	Mrs. Stephen Krane
Neurology	Mrs. Carl Essig
Neurosurgery	Mrs. Bernard Stone
Orthopedics	Mrs. Harrison O'Connor
Pediatrics	Mrs. Robert Rosen
Psychiatry	Mrs. Peter Sifneos
Radiology	Mrs. Alexander Macmillan, Jr.
Staff	Mrs. E. Wayne Wilkins, Jr.
Surgery	Mrs. Ira Ferguson, Jr.
Urology	Mrs. Thomas Mathieu

The service representatives will act as a group who, at periodic intervals, will contact each member on the respective services and report any information of importance to the officers. This will also aid the file secretary in maintaining an accurate list of members — a most important duty of these representatives. Also, to include additional members in the actual business proceedings of the Club strengthens the foundation of the organization.

Other chairmen appointed to various committees are as follows:

Housing	Mrs. Winfield Morgan
Penthouse	Wilma Canada, M.D.
Hospitality	Mrs. George Nardi
Child Care Service	Mrs. Elbert Tuttle

The housing service was established to give assistance to those who wish to obtain apartments in the vicinity of the Hospital or in the suburbs, particularly those who come from a distance. The housing officer should be notified of a vacant apartment, so that she, in turn, may notify someone in need of quarters. There is also a plan being worked out with the MGH Staff Wives Hospital Committee (Mrs. Richard Sweet, Chairman), toward the exchange or rental of available furniture. The housing officer will keep a list of such furniture as can be utilized.

The Penthouse is now under the care of the Distaff Club. One person is appointed to supervise the general housekeeping and the replenishing of supplies. She will also give permission to any eligible group who wishes to use the Penthouse for a gathering, provided she is notified at an early date.

The hospitality committee is a very important addition to our organization. It will send a note of welcome to each new member of the house staff and his wife and family. This welcome will include information on how help may be obtained in finding an apartment, a plan of Boston if the newcomers are strangers to this part of the country, and an introduction to the activities of the Distaff Club. This committee will be responsible for sending out cards when special occasions arise. A news bulletin, also, will be printed at various intervals and sent to the members. In this way we hope to foster friendliness among our members. If we all get to know each other better, our organization will become more active and vital.

There is a problem involved in finding people to care for the children of our members who would like to attend the meetings of the Distaff Club and also give their services to one of the Volunteer Groups in the Hospital. At the moment, the assistance of the student nurses is available by calling LA 3-8200, Extension 314. Members of the Club would like to install another service to help solve the problems of those who require baby sitters when the existing service fails.

The meetings of the Distaff Club will be held on the first Wednesday of each month, and will include social as well as business meetings. Meetings in prospect are a Spring Picnic for members who are leaving the Hospital and those arriving, and a Spring Fashion Show. During the summer no official business meetings will be held, but we hope to entertain the members at parties.

At this time it is always propitious to remind members that dues of the Distaff Club are two dollars for one year, one dollar for half a year. Our treasurer is Mrs. John Binion, and she would appreciate receiving your contributions.

Ladies' Advisory Committee to the School of Nursing

The Annual Meeting of the Ladies' Advisory Committee to the School of Nursing was held in Miss Sleeper's office on Tuesday, March 24. Miss Dorothy Bartol, Chairman of the Nominating Committee, presented the following report, which was accepted and sent to the Trustees for approval:

Dr. Dean A. Clark, Hospital Administration representative
For a term of 3 years
Mrs. Lloyd D. Brace, Chairman
Dr. Rita M. Kelley, Medical Staff representative
For a term of 5 years
Mrs. Van Courtlandt Elliott, member of the Committee
Mrs. Harris Fahnestock, member of the Committee

The Committee extended a sincere and unanimous vote of thanks to Mrs. W. K. Jordan, retiring Chairman, for her progressive leadership during the past six years. Her previous experience in the field of liberal education and her sound judgment have been of inestimable value to Miss Sleeper. Her enthusiasm for the School itself and her keen grasp of its problems have made her a stimulating Chairman of the Committee.

The Ladies' Advisory Committee has been enlarged to include: "At least 4 representatives from the community at large, and in addition representatives from the field of education and health"

Fabian Bachrach

NO. 40 IN A SERIES OF STAFF PHOTOGRAPHS
MR. FRANCIS S. HILL, DIRECTOR
MASSACHUSETTS EYE & EAR INFIRMARY

together with "3 members of the Alumnae Association of the M.G.H. School of Nursing and one member of the Medical Staff of the Hospital." Besides these elected members of the Committee, there are 3 ex officio members: "One representative of the Ladies' Visiting Committee of the Hospital, the General Director of the Hospital or his representative, and the Director of the School of Nursing."

Mrs. Jordan and the Committee felt that, due to the changes in and the growth of nursing education during the past ten to fifteen years, a new plan of organization should be set up and the purposes of the Committee clearly stated. This was done in 1952 and the plan was sent to the Trustees for approval. As these purposes may be of interest to other groups in the Hospital and will explain the work of the Committee and its plans for future development and program, they are set forth here.

PURPOSES

1. To study the over-all educational program of the Massachusetts General Hospital; to study the needs of the School of Nursing and ways of improving its curriculum, personnel, and program; and to consider problems of Nursing Service in the Hospital as they influence the education of nurses.
2. To interpret the purposes and program of the School of Nursing to the public.
3. To make known community opinions and needs to the Director of the School.
4. To make reports of the progress and the needs of the School of Nursing to the Trustees' Committee on Nursing.

Each year the Committee has studied, along with other current business, one specific problem related directly to nursing education in the M.G.H. This past year a series of doctors and supervisors have spoken to the Committee on their specialties as they related to research at M.G.H. and their effect on nursing and nursing education. These discussions have been both informative and interesting and will be reviewed by the Committee at their May meeting.

New addresses:—

Dr. Edwin L. Cantlon (*E.S.* 1938), 220 South Virginia St., Reno, Nev.

Dr. David W. Compton (r.p. *An.* 1946), 1110 Harvard Ave., Seattle, Wash.

Dr. Jaime Cortázar (gr. stud. a. *M.* 1951), Apt. 101, Carrera 12 #24-66, Bogotá, Colombia.

Dr. Albert G. Engelbach (past a. dir.), 228 Commonwealth Ave., Boston 16, Mass.

Lt. John O. Esslinger, MC, USAR (a.r.s. *Or.* 1952), Tokyo Army Hospital, APO 1052, c/o Postmaster, San Francisco, Calif.

Dr. Freddy H. Frankel (r.p. *Psychiat.* 1953), 15 Friedland Ave., Cyrilbene, Johannesburg, South Africa.

Dr. S. Grant Holmes (*C.M.* 1943), 1606 East La Rua, Pensacola, Fla.

Dr. Theodore F. Hueter (res. fel. *Physics*), 43 Algonquin Rd., Newton, Mass.

Dr. Joseph Lentine (assoc. s. *Otolar.*), 15 Bay State Rd., Boston, Mass.

Dr. Terry E. Lilly, Jr. (*E.S.* 1943), 915 Argyle Bldg., Kansas City, Mo.

Lt. John W. Littlefield, MC, USNR (*M.* 1948), Oak Knoll Naval Hospital, Oakland, Calif.

Dr. Hugh A. MacMillan, Jr. (a.r.s. 1947), 1801 High St., Denver 18, Colo.

Dr. Roger W. Morrison (*E.S.* 1943), 65 Sunset Parkway, Asheville, N. C.

Dr. Edwin H. Mulford, II (a.r.s. *N.S.* 1947), 144 Golden Hill St., Bridgeport, Conn.

Dr. William Parson (c.r.p. 1942), University of Virginia, University, Va.

Lt. Paul S. Russell, Jr., MC, USAFR (*S.* 1949), 1601 Azalea St., Victoria, Tex.

Lt. Walter T. St. Goar, MC, USAFR (*M.* 1950), 21st Med. Group TAC, George Air Force Base, Victorville, Calif.

Dr. Truman G. Schnabel, Jr. (a.r.p. 1947), 209 Woodside Ave., Narberth, Pa.

Dr. James K. Stoddard (*E.M.* 1917), 1311 Delaware Ave., Wilmington 6, Del.

Dr. Marcy L. Sussman (r.p. *R.* 1930), 801 North Second Ave., Phoenix, Ariz.

Dr. Gray H. Twombly (*W.S.* 1932), 842 Park Ave., New York, N. Y.

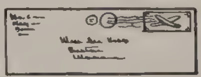
Brief bits:—

The Doctors Benedict sailed for Europe recently aboard the *Queen Mary*. Their schedule includes addresses to be given in France, Belgium, Switzerland, London, Birmingham, and Leeds. They expect to return by June 30.

Dr. Bradford Cannon was the speaker on Cancer Conference Day for the New Hampshire Medical Society, at the Carpenter Hotel, Manchester, N. H., on April 8. His topic was "Plastic operations in treatment of cancer".

Dr. and Mrs. John B. Graham returned in March after spending five months in Europe. Most of their time was spent in Stockholm, Sweden. While there, they conducted investigative work on one hundred cases of cancer of the cervix seen at the Radiumhemmet. After leaving Sweden they visited clinics in Denmark and England. Mrs. Graham spoke on "Cytologic diagnosis of cancer" at the University of Edinburgh and at the Royal College of Obstetrics and Gynaecology in London.

Dr. Robert J. Vitt (a.r.s. *Or.* 1951) announces the opening of his office in the Beebe Building, 210 South K Street, Tulare, California. His practice will be limited to orthopedic surgery.



A short note, giving us a new address for Dr. Joseph H. Boyes (*Path.* 1930), reads:

> Although your records show that I am the only MGH alumnus in the town of San Gabriel, California, this is because the metropolitan Los Angeles area consists of a large number of small communities surrounding the main city. My office address is 1401 South Hope Street, Los Angeles 15, therefore I cannot qualify in your "singleton" class.

> I have enjoyed receiving THE NEWS from Massachusetts General Hospital, and at various meetings throughout the country I often see many men whom I first met there. Next year we hope to visit Boston to again renew old acquaintances.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 124 Boston, Mass. June 1953

EDITOR'S NOTE: In our attempt to cover, in THE NEWS, every professional department in the Hospital, we have up to now omitted one very important (in fact, indispensable) individual without whom no department could function — to wit, the patient. That omission is herewith canceled out.

A few days ago Dr. Dean A. Clark sent us a communication which had come to him. In Dr. Clark's opinion the article deserved wide circulation and he suggested that we might like to publish it in THE NEWS. As soon as we had read it we agreed, enthusiastically, and we understand that it will also appear in an early issue of *Hospitals*.

The letter, transcribed below, was written by Dr. J. M. Mackintosh of the London School of Hygiene and Tropical Medicine (University of London), and was addressed to the members of the Hospital Administrators' Correspondence Club. The sketches which accompanied the letter were drawn by Miss B. E. M. C. Stillwell. They are reproduced on page 8 of this issue.

Here is the letter:

ENEMIES OF THE PATIENT

Quite recently I was in a hospital where administrative efficiency had run mad. The patient was described officially as "a unit of sickness." Even in more humane hospitals, however, it is not a good thing to be a patient, unless one is ill. I once knew a man who was convalescent and he was able to move around fairly well in a large, crowded ward. I understand that he was mistaken for a ward attendant for several months! The story is also told of a young surgical intern who was believed to be a patient because of his diffidence in the wards. It is easy to tell when a patient is ill: he is either silent or he bleats like a little ewe lamb. When he becomes difficult and cantankerous, he is convalescent.

The patient in bed has enemies lurking amongst his many real friends in hospital. The first and greatest of these is:

(1) NOISE

He must be able to open and close his ears at will. In consideration of the noise going on by day and by night in many hospitals he will be tempted to keep them permanently closed. The main elements of this more or less constant hubbub are:—

(a) Elevators. These are called "lifts" in England and are so designed as to create the greatest possible noise over the largest possible area. Their gates clang, with a jangle of discord; the machinery, although housed far away in the basement, uses the shaft to trumpet its mechanical faults at all times, and finally the elevator is placed as close as possible to the patient area.

(b) Movable furniture. This consists of quite a number of things on squeaky wheels used to carry food or medical equipment and dressings or even (in the more primitive British hospitals) a pestilent substance called coal. There are many ways of making a noise with these trolleys. Perhaps the most effective and loudest is to bang them against doorposts and beds. Another successful method is to place cups, saucers, etc. on them in such a way that they rattle violently with every movement. [See illustration No. 1] Bed screens on wheels can be designed to give excruciating agony to sensitive patients. Even curtains on rails can be so maintained as to give constant irritation when they are moved on their runners.

(c) Other human beings in the hospital. Some of the noises cannot be altogether avoided: there are, for example, patients who are noisy by nature or illness, and there are those dear souls who carry on a conversation about their children or grandchildren across the ward. Unnecessary noise created by the staff is sometimes a just cause for complaint. [See illustration No. 2] Laughter and cheerfulness on part of nurses and attendants are great assets, but their ministrations can be overdone in the late evening; and then there is the intern who arrives on the ward at 2 a.m. after having had a pleasant evening at the local pub.

(d) Noises outside. In a recent issue of a newspaper I came across this letter from the Administrator and Secretary of one of the largest teaching hospitals in London. I think that you will agree that it is interesting and significant:

> Hospital noise
>
> You carried two letters last week from patients complaining of the noise made by cars and motorcycles starting up in the streets round this hospital. My Board of Governors are greatly concerned about this nuisance as they are well aware that this goes on until the small hours of the morning. Everyone realizes that this must be particularly trying for patients, but unfortunately the authorities who are responsible for controlling our parking places are not influenced by these considerations.
>
> About two years ago the police sited public parking places alongside the hospital and, in reply to our protest, informed us that it would practically take an Act of Parliament to have these parking places moved a short distance away from the hospital.
>
> Our problem would be greatly eased if a short section of the road at the back of the hospital could be turned into a private roadway and thereby closed at night. This is being considered at present by the local authority.

(2) EXCESSIVE LIGHT

He must be able to dim or black-out his eyes at will. There is nothing more trying for a patient who is sick in bed than a bright light full in his eyes. This may come from a window by day or a ceiling light by night. There is in England a historical reason for our failure to appreciate the importance of design in lighting. Years ago hospitals were stuffy, dangerous and full of smells. The sanitarians of the late nineteenth century were naturally anxious about light and ventilation and in hospital design they went to the extreme worship of cubic space. They provided enormous windows, ceilings of incredible height, and bright, draughty wards. These one can see today in almost any large general hospital. The ceilings are so high in fact that some of the four-bed rooms would be considerably larger if they were laid on their side. These sick rooms may be agreeable to visitors and even nurses and they lend a certain dignity to the view; but they are very annoying to patients, especially the unfortunate people who are fixed in frames or other apparatus. In most of our new or redesigned hospitals the beds are placed sideways to the windows and that is all to the good because it gives much more freedom to the patient and helps him to get away from the light, but how are we to improve the innumerable older hospitals where these changes are hardly possible? Outside blinds and shutters may give some relief but they tend to cover too great a window area. We often provide movable screens for patients out of doors and the principle of the adjustable shade which could be moved by the patient himself would be of value indoors also, especially when the bright light is shining on the bed.

Another method is to grow eyebrows sufficiently large, dark and bushy to act as eyeshades. [See illustration No. 3] This saves the hospital the trouble and expense of doing anything about it.

(3) LACK OF PRIVACY

This enemy appears in several forms, some material and others like malignant ghosts. When a patient lies in an open ward, especially if this has more than four beds, he must, if he is at all sensitive, feel the need at some time of the day to be by himself. A large room means that everything has to be shared by everybody, that every action may be seen by prying eyes. Movable screens, although useful for toilet and dressing purposes, do not meet the patient's real need for a little privacy. Probably the best method is to have curtains with fixed rails above each bed so that the patient can himself draw the curtains, partly or wholly, if only to screen himself from neighboring occupants. This is little protection against noise but it at least cuts off excessive light and the irritating feeling of constant movement.

Another enemy is that abominable anachronism known as the bed-pan. We are learning at last in many hospitals, in the interest of safety, quiet and efficiency, to provide special rooms for dressings and other personal attentions to patients. We have yet to learn in most hospitals that special rooms provided with toilet and lavatory basin are essential for the comfort for all but a few patients. There are, of course, emergencies and exceptional cases which have to be met but in the overwhelming majority, patients are far less exhausted and far more comfortable when they can be taken to an appropriately designed lavatory for washing and toilet.

In a very real sense this is an engineering problem rather than a medical or architectural one and it is high time we invited the engineer to advise us. I have never been able to understand why in hospital design and management, we are so reluctant to put the fundamental problems of *lifting* and *moving* to the engineer and bring him into our counsels. We are in the absurd position that in industry we can easily, almost without effort, lift one or a dozen wooden cases, weight 300 pounds apiece; but we still lack a design for lifting and moving a patient weighing perhaps 150 pounds or less. Modern methods of simple weight-raising apparatus should be studied and applied to the patient in bed. When that has been done the special room will replace the bed-pan for the vast majority of patients, and for mechanical lifting of a sick person a much more efficient apparatus, anatomically and physiologically, will meet the patient's needs at the bedside.

While we are on this subject of engineering facilities, I should like to refer to a simple device which would greatly ease the task of nurses and attendants and at the same time give the patient a sense of mobility — of being able to get about — which is so lacking at the present time. Every morning as I drive into London I see in our streets people delivering supplies of milk in bottles; the truck on which these bottles are stacked is far too heavy to be moved by any individual yet the milkman simply seizes a handle and presses a lever and off he goes happily trailing his milk truck behind him. It would surely be very easy, and in the long run inexpensive, to devise a simple apparatus of this kind to move beds. It is not necessary that it should be permanently attached to every bed but simply in the form of an electrically operated "jack and handle" to move beds from place to place. This would greatly ease the work of staff for both dressings and toilet operations. It would be great fun if we could get the patients to drive their own beds in suitable cases, especially in country hospitals with a large amount of space. [See illustration No. 4]

(4) LONELINESS

So far I have been quoting a few illustrations dealing only with the physical side of a patient's needs but, of course, that is not nearly enough; there are many enemies with much greater subtlety in the psychological field. I think we should speak first perhaps about loneliness. Most people who are no longer acutely ill feel that time goes rather slowly. On the other hand they are often quickly fatigued by conversation and also by frequent interference for one service and another. Even where visitors are most welcome, patients in hospital are easily tired by the effort of talking and of concentrating their minds on matters outside the hospital routine. On the other hand, it is notorious that many patients, adults as well as children, in single rooms are apt to become desperately lonely and miserable. Loneliness is an enemy, but excessive attention, fussiness and interference are almost as vicious. The ideal is to strike a balance between the two according to the patient's needs and wishes. It is sometimes not realized that a patient can be as lonely in a crowded ward as in a separate room.

In many cases patients are worried by lack of a reasonably continuous period for sleep. It has been said bitterly that a patient's working hours in hospital are from 4 a.m. to 10 p.m. and this indictment is true enough where there are innumerable petty services, examinations and consultations to prevent the patient having continuity of rest. This problem deserves close study at regular intervals in every nursing unit. Another serious enemy to the patient's well-being in hospital is a sense of insecurity: this is partly due to doubt about the course of the illness but even more often to the lack of somebody to sit down and answer simple questions from time to time. In one of our leading newspapers not very long ago there was a good deal of correspondence about the anxiety that patients feel before an operation or a confinement and a number of patients complained that if only some kindly person had told them what to expect, it would have made all the difference to their comfort and relieved any apprehension. This is by no means always the fault of the administrative services in the hospital. There is in England, at any rate, a long tradition of silence amounting to secrecy about medical matters. I wish we could give more study to the question of what a patient should be told. The facile attempts to allay fears by telling nothing in soothing words is a greater irritation to most patients than mere silence. Patients do not like to be treated like small children; and incidentally even small children need some words of explanation before anything happens to them in hospital.

In all my enquiries about patient amenities I have been struck again and again by complaints about the conduct of confinements in hospital. One young mother after another has told me plaintively that she was left alone and in fear about the time of the delivery of the child. I am satisfied on enquiry that the overwhelming majority of these complaints are due to a misunderstanding which could easily be cleared up when the mother has recovered from the immediate effects of labour. If I am right what seems to happen is this: that towards the end of the second stage the patient, who is in any case in pain and discomfort, is given an anaesthetic of one kind or another. Even the mildest anaesthesia is sufficient for considerable disorientation; the patient no longer sees clearly the people who are around her and she imagines that she is entirely alone. Very often some kind of explanation is given before the baby is born and the surgeon or nurse says comfortingly, "I will be with you at the time." In spite of this, apprehension quickly turns to resentment when she goes over her experiences after the baby is born. Now if someone were to sit beside her for a few minutes and explain in clear enough language what happened and say "I was there", then her apprehension and resentment would be quickly dissolved and so we should be relieved of many unnecessary complaints.

We have already set out in many volumes the qualities of a good administrator. It might be valuable to study the qualities of a good patient for a change.

(1) A patient's education should conform to the standards established by the American College. He should be conversant with the current trends of medical treatment and thoroughly posted on everything pertaining to the sickroom.

(2) He should have a pleasant personality and so inspire confidence in his medical and nursing attendants.

(3) Sense of importance. He must be mindful of the fact that he is the person about whom the entire institution revolves and that his own comfort comes first. [See illustration No. 5]

(4) Tact and diplomacy. Probably no vocation, other than being a patient, requires more tact and discretion in handling people. There are nurses to be considered and attendants who bring tepid meals, often poorly served; there is the need for affability during the farce of the consultant's weekly round at the head of a column of lesser personages. A colleague of mine, himself recently in hospital, said, "The patient is so overawed that he asks none of the questions he would like to, and even if he did it is doubtful if he would get a reasonable answer." The cultivated air of detachment is not reassuring to the patient who has, after all, some interest in his illness and deserves a little recognition in any discussion round the bedside.

(5) Patience. This is obviously the basic need of the patient. There is little to be gained, and much to be lost, by throwing the bed-pan out of the window. [See illustration No. 6]

(6) A controlled sense of humour. The patient may find considerable scope for entertainment but when the matron,

or principal nurse, slips on a discarded banana skin his laughter should not be too obvious.

(7) A sense of fairness. You cannot be a good patient unless you can see your position in relation to the staff and the other patients.

These are merely light illustrations but you will appreciate that they conceal a good deal of serious thought beneath. The administrator's main duty to patients, I feel, is to make sure that they have a sense of confidence in the hospital and all of its staff. This can be done by careful education and explanation before unusual or frightening events occur, and when a sick person has to undergo an operation it is of vital importance to tell him about it and to say in Browning's words:

"You will wake, and remember, and understand."

* * *

Dr. Edward D. Churchill was made an Honorary Member of the Korean Communications Zone Medical and Dental Society on April 4.

* * *

Research activities, June 30, 1952 — *December* 31, 1952 will be available in the Research Committee office to any subscriber of THE NEWS who is interested in receiving a copy.

This pamphlet contains a listing of research publications, department by department, written by MGH staff members during the period covered, and titles of papers already accepted but not yet published during this period. It also contains a listing of projects for which grants were obtained during 1952.

In addition, there are reprints of articles that have appeared in THE NEWS, which summarize representative departmental programs.

The Board of Trustees, at their meetings on April 17 and May 1, voted:

To promote:

Dr. Howard Rasmussen from the position of Intern to that of Third Assistant Resident in Surgery, beginning July 1.

To appoint:

Dr. Ralph C. Darling, Jr. as Intern on the Children's Medical Service, beginning July 1;

Dr. Richard R. Evans as Assistant in Medicine;

Mr. Frederick D. Foster as an Assistant Director, effective as of April 1;

Dr. Charles F. Goodnough as Assistant Resident in Anesthesia for one year, beginning October 1;

Dr. Samuel L. Katz as Assistant Resident on the Children's Medical Service for one year, beginning July 1, 1954;

Dr. Stephen M. Krane as a Dalton Scholar, from July 1 through December 31;

Dr. Jane S. Rasmussen as Intern on the Children's Medical Service, beginning July 1;

Dr. Désiré J. Rebello as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Raymond D. Sphire as Assistant Resident in Anesthesia, beginning July 1;

Dr. Henry F. Zartman as Intern on the Children's Medical Service, beginning July 1.

At their meetings on April 8, 15, and 22, the General Executive Committee voted to appoint:

Dr. Len H. Andrus as Graduate Student Assistant and Clinical Fellow in Dermatology, beginning May 1;

Dr. Alexander S. Macmillan, Jr. as Clinical Fellow in Radiology, on leave of absence at Oak Ridge Research Hospital, for the period July 1 through December 31;

Dr. Maria L. Martinez as Clinical Fellow in Dentistry for one year, beginning April 15;

Dr. Miguel A. Mora as Clinical Fellow in Psychiatry, beginning July 1;

Dr. Edith Simandl as a Fellow in Anesthesia for one year, beginning September 1;

Dr. Warren B. Weil as Clinical Fellow in Medicine, to work with Dr. Harriet L. Hardy, for the period April 20 through October 31.

At meetings held earlier, the General Executive Committee voted to appoint:

Dr. Teruyoshi Hashiba as Clinical and Research Fellow in Neurosurgery for one year, beginning February 1;

Dr. Suzanne Leroy-Wilkin as a Fellow in Anesthesia for one year, beginning September 1;

Dr. Henry Neiditsch as a Fellow in Anesthesia, beginning September 1.

* * *

National Hospital Day was observed as a special visiting day at M.G.H. As the guests entered the White Building they were greeted by Dr. Clark and the Assistant Directors, who spoke briefly on a few outstanding features concerning Massachusetts General. Following this, the visitors were taken in groups on a tour of the Hospital, with MGH Volunteers acting as guides. The route included the Emergency Ward, the Overnight Ward, the Chapel, a solarium on White 7, an Operating Room, the Ether Dome, and the Research Building, ending at Bartlett Hall where refreshments were served.

THE ROBERT W. LOVETT MEMORIAL LABORATORY

THE BIOLOGY OF CONNECTIVE TISSUE

In 1929 the Arthritis Research Unit was created under the joint aegis of the Harvard Medical School and the Massachusetts General Hospital for the purpose of studying articular disease. This unit was organized and is directed by Dr. Walter Bauer. In the course of 24 years the group has undertaken extensive detailed clinical studies on the natural history of rheumatic disease and has, in addition, made contributions to our knowledge of the anatomy and physiology of articulations and the properties of connective tissue — that tissue which appears to be intimately involved in the rheumatic process.

One very significant feature of the work of this unit is its necessarily broad scope. The large group of disorders involved include rheumatic fever, rheumatoid arthritis, lupus erythematosus disseminatus, scleroderma, dermatomyositis, periarteritis nodosa, degenerative joint disease, and allied disorders, many of which are severely crippling as well as fatal. Not the least of the problems within our province is the aging process itself. Most of these maladies are generalized, constitutional in nature, and are rarely localized to a single organ or tissue.

Despite the concentrated efforts of this and many similar research groups, the nature of rheumatic and allied illnesses is still a mystery. To quote Dr. Bauer from the 1950 report to the MGH NEWS on the Arthritis Unit: "The failure to disclose specific leads as to the etiology or pathogenesis in the clinical studies of rheumatoid arthritis and the related diseases has . . . reoriented us to a more fundamental approach — namely, a characterization of the tissues involved, so that as the normal is defined we can better interpret the alterations produced by the disease. Such an approach necessitates also a study of the reactions of tissues in vivo and in vitro and of the individual as a whole to insults of various types. These studies will be pursued in the years to come."

During the past 5 years Dr. Bauer has brought together a small nucleus of laboratory investigators including an organic chemist, enzyme chemist, physical chemist, biologist, and pathologist for the purpose of studying the nature of connective tissues, their reactivity, their physiological significance, and their derangements.

The connective tissue which fills the space between the cells and organs throughout the body is composed of a variety of proteins, carbohydrates, and lipids, in addition to its own particular cell types. In some instances it is highly differentiated — for example, into bone, cartilage, and basement membranes. It has been rather generally considered to be the excelsior of the body. Until relatively recently little thought has been given to the physiological significance of this ubiquitous tissue other than to its obvious mechanical functions.

Several evident facts indicate that the connective tissue is not just so much inert stuffing, but may play an important role in both fluid transport and embryogenesis. It is obviously involved intimately in wound healing and pathological sclerosis, and plays a significant part in limiting the spread of infection. The fact that in every organ and tissue in the body there is a layer of extracellular substance, often loose and thick, frequently compact and thin, between cells and blood and lymph vessels suggests the possibility of modulation of the flow of fluid nutrients and metabolic products between cells and plasma. There are no free extracellular spaces through which fluid trickles freely. The presence of this extracellular gel composed of highly charged proteins, carbohydrate polymers, and lipids makes very real the possibility that the extracellular substance may function in an ion exchange capacity and as a selective semipermeable barrier, passing some molecules freely, barring others completely, and changing the rate of diffusion of still others. There is a growing body of experimental evidence indicating such activity. It is also known that certain hormones can markedly influence the composition of the extracellular ground substance, also that these materials are profoundly modified with age. It is reasonable to presume that any factors which interfere with the flow of electrolytes, nutrients, or water to the cells, or with the removal of waste products, could exert considerable influence on cellular function.

The importance of embryonic connective tissue in the development of the various organs and other structures has become increasingly evident. Some of the mechanisms have been dramatically demonstrated by Paul Weiss, University of Chicago embryologist, and have led to practical applications in the treatment of severed nerves. Operation of these mechanisms in the general processes of wound healing are yet to be exploited.

The author entered this field via an interest in rheumatic fever, but felt that further advances in unraveling the pathogenesis of the disease required the application of principles and methods which would attack more fundamentally the chemical and structural processes involved. An early introduction to the biophysical and chemical approaches made it evident that an understanding of tissue abnormalities on a molecular or colloidal level required a thorough knowledge of the nature of the normal structures and the range of their reactivities. The first step was a study of the characteristics of the normal purified components of connective tissue. A firm foundation had already been laid by the chemists who had made intensive analytical studies of collagen — that all-pervading fibrous protein (which comprises upwards of 30 percent of the protein of the mammalian body), and of the mucopolysaccharides — the carbohydrate components of the connective tissue ground substances. A good beginning had already been made in the study of the molecular and colloidal organization of collagen by x-ray diffraction and electron microscopy, particularly in the Biology Department of Professor F. O. Schmitt at M.I.T. where the author served his apprenticeship and with which department he is still associated.

The advent of the new Research Building at the Hospital made available to the Arthritis Unit the 2d floor for the study of connective tissues and their diseases. Here it has been possible to provide additional laboratories other than those concerned with clinical investigation. We now have a completely equipped and well staffed organic Chemistry Unit under the direction of Dr. Roger Jeanloz. He is engaged in the successful unraveling of the structure of the acid mucopolysaccharides. Dr. Morris Soodak continues with the study of the enzyme systems and substrates involved in the synthesis of these substances. Dr. Karl Schmid, formerly a member of the University Laboratory of Physical Chemistry, Harvard Medical School, is in charge of the Physical Chemistry Laboratory in the Research Building. He is working on the purification and characterization of the carbohydrate-containing proteins (glycoproteins) of the blood and tissues. Dr. David Kahn, our pathologist, and Dr. Peter Kulka, his predecessor, are attempting to provide a more complete and instructive picture of the pathological processes in the so-called "connective tissue diseases". In addition, there are several research fellows working on individual aspects of these problems: Dr. Allan Dixon, from England, is trying to split off and characterize the carbohydrates of the purified blood glycoproteins isolated by Karl Schmid; Dr. Pierre Stoffyn, from Belgium, is working on the structure of chondroitin sulfate; and Dr. Eino Kulonen, from Finland, is studying the chemistry of "procollagen", an extract of connective tissues. In subsequent publications in this series the purposes, results, and directions of these studies will be discussed in detail by some of the workers mentioned.

The aspects of the problem undertaken in the author's laboratory are concerned with (1) the physical and chemical characterization of collagen from various members of the animal kingdom, ranging from the sponge to man; (2) an intensive study of the mechanism of fibrogenesis, or the formation of collagen, undertaken in collaboration with Professor F. O. Schmitt of M.I.T. and Dr. J. H. Highberger of the United Shoe Machinery Corporation; and (3) an attempt to define the range of reactivity of purified and native collagen by studying the influence of a variety of known reagents including acids, alkalis, swelling agents, and enzymes, such as collagenase, proteinase, hyaluronidase, etc. The laboratory is equipped to do electron microscopy, several forms of light microscopy, analytical chemistry, histochemistry, and tissue culture. We are not committed to any one technique and will develop any procedure within reason which is required for the solution of the problem. The electron microscope happened to be admirably suited for the study of certain aspects of the above mentioned problems because collagen fibrils have a unique fingerprint in the colloidal range of dimensions, namely, a periodic striation with distinctive intraperiod banding which repeats itself with remarkable regularity about every 640 angstrom units or .000064 millimeters. This pattern is well below the resolving power of the light microscope. It appears to be characteristic of collagen throughout the animal kingdom with few known exceptions. By studying the effect of chemical, physical, and physiological agencies on this characteristic pattern we are able to learn a great deal concerning the structure and reactivity of this protein.

Our most exciting problem is the study of the fibrogenesis of collagen. Following the lead of some simple brilliant experiments of Nageotte in France in the early part of the century, wherein he showed that certain forms of collagen could be dissolved in dilute acid and reprecipitated as fibers by salt, we were able to demonstrate with the electron microscope that such reprecipitated fibers had the same distinctive axial periodicity in all its detail as did the original native collagen. This result suggested that the building blocks of collagen, the large molecules in solution, could be polymerized to form a highly organized fibril structurally identical to native collagen solely through the alteration of the ionic environment — in the absence of cells or enzyme systems. This in vitro phenomenon serves as a working model, probably highly oversimplified, of the process whereby collagen may be organized into fibers in the extra cellular spaces of the connective tissue. We have learned how to control within limits the type of fibril precipitated from solution in terms of the type of axial periodicity obtained, through the intervention of the acid glycoprotein of the blood, mentioned previously, and of adenosine triphosphoric acid (ATP) in such a way as to shed significant light on the characteristics of the collagen molecule and mechanisms of their polymerization. We have extracted certain soluble collagen fractions from connective tissue with mildly alkaline buffers from which can be reconstituted fibers and "crystals" having the same structure as those produced by addition of acid glycoprotein in one case or ATP in the other to simple acid solutions of rat tail tendon collagen. It would seem, at this time, that the collagen molecule itself contains all the essential qualities needed to form the several types of periodically banded fibrils; materials like glycoproteins and ATP act as polymerizing agents. Chemical analyses are in progress to determine the carbohydrate moiety and possible nucleotide content of the native collagen and that precipitated from its extracts. There exists the possibility that these or similar fibril-inducing agents may play a role in the genesis of collagen. Also under study are the dimensions and properties of the extracted collagen with the now classical physical chemical tools, such as the ultra centrifuge. It is worthy of note here that the electron microscope is being used as one important tool among many in the study of a dynamic process.

There is little need to point out the general importance of fibrogenesis in the fundamental process of structure formation in cells and tissues, and of the genesis of collagen fibers in particular in wound healing and pathological sclerosis. The present studies on fibrogenesis in the test tube are to be followed up by investigation of this process in tissues in which it can be experimentally controlled, as in healing wounds in normal and scorbutic animals (already begun), in the coxcomb of the rooster under the influence of the sex hormones, in tissue culture, and in certain tumors. Other members of our group are interested in the nature and synthesis of the mucopolysaccharides and glycoproteins in these tissues, and a joint effort is being planned for an over-all attack on one of these biologically reactive systems.

It is hoped that the establishment of a basic body of knowledge concerning the nature and behavior of the connective tissues will provide a broad base from which to logically attack the problems of their function and malfunction, thereby contributing to our understanding and treatment of these mysterious maladies.

Jerome Gross, M.D.,
Associate Biologist

Bartlett Hall, our new 9-floor, apartment-type nurses' residence was opened for inspection on April 29 — only a few days over the time schedule of one year set for its completion.

We intended to give you a description of the building, its furnishings, and equipment for this issue of THE NEWS; but, as we take our typewriter in hand, we find ourselves utterly stumped. Where to begin? Where to end? In an entire page of print we could not begin to give even a hint of its charm.

So — instead of making a futile effort (and it *would* be futile, at best) — we simply say, if you haven't yet been inside Bartlett Hall, avail yourself of the first opportunity to see it.

Congratulations again to the MGH family! A highly successful food sale was held on May 7 in the Brick Corridor. Nominally under the auspices of the Nursing Department, it actually encompassed all the departments in the Hospital and even included the surrounding community.

It is impossible to list all who gave so generously of time, labor, supplies, food, or money. The goal was far surpassed. At the last tally the sale realized $483.75. We thank you all for your splendid cooperation and support. The occupants of Bartlett Hall can now enjoy good listening with the FM radios in the sitting rooms.

The "Homecoming" celebration of the Massachusetts General Hospital Nurses' Alumnae Association will take place this year on June 5-7. A program of the many exciting and interesting events scheduled for each of the three days is posted on the bulletin board near the foot of Treadwell stairs.

New addresses:—

Dr. Albert G. Engelbach (past a. dir.), 1801 Calvert St., N. W., Washington 9, D. C.
Dr. Nathan O. Kaplan (past a. res. chem.), McCollum-Pratt Institute, Johns Hopkins University, Baltimore 18, Md.
Dr. Louis Kunian (clin. a. *M.*), 8 Broad St., Lynn, Mass.
Dr. John R. Mote (*W.M.* 1937), Chemical Specialties Co., Inc., 22 E. 40th St., New York, N. Y.
Dr. John S. Robey (*C.M.* 1953), Crowe Agency, Mont.
Dr. David A. Sampson (a.r.p. *R.* 1937), 203 Suburban Square Bldg., Ardmore, Pa.

MASSACHUSETTS EYE & EAR INFIRMARY

Members of the Infirmary staff traveled to New Orleans to attend Otolaryngological Meetings and Board examinations held during the third and fourth weeks in April. Dr. LeRoy A. Schall, Dr. Harris P. Mosher, Dr. Philip E. Meltzer, and Dr. Werner Mueller attended sessions of the American Board of Otolaryngology for the examinations given from April 19 to 22.

Dr. Schall, Chief of our Ear, Nose and Throat Service, retired as President of the Board and was succeeded by Dr. Frederick T. Hill (*Aural* 1916). Dr. Gordon D. Hoople (*Otolar.* 1926) was elected Vice President and Dr. George F. Reed (a. *Otolar.*) was elected as an Assistant to the Board.

Since so many of his former students and residents were in New Orleans for the conference and Board meetings, it was a fitting opportunity to pay a tribute to Dr. Harris P. Mosher, former Chief of the Otolaryngology Department and now a member of the consulting staff. Thirty persons attended the breakfast held in his honor at the Roosevelt Hotel on April 27.

Some fourteen members of the Otolaryngological staff participated in the various meetings that took place from April 24 through May 2.

Dr. Schall presented a paper before the American Laryngological Association on the subject "The laminagraph as an aid in the diagnosis of diseases of the larynx". The co-authors of the paper were Dr. Alexander S. Macmillan, Infirmary Roentgenologist, and Dr. Paul M. G. St. Aubin, Resident in Radiology at Massachusetts General Hospital.

Dr. Werner Mueller, Director of the Mosher Laboratory, gave a paper before the American Laryngological, Rhinological and Otological Society. The topic was "Selection of hearing aids as an office procedure".

Dr. Moses H. Lurie, Surgeon in Otolaryngology, and Dr. Philip E. Meltzer, Surgeon in Charge of the Winthrop Foundation, read papers before the American Otological Society. Dr. Lurie's work was entitled "The ototoxicity of dihydrostreptomycin and neomycin". His co-author was Joseph E. Hawkins, Jr., Ph.D. Dr. Meltzer's subject was "Unrecognized cholesteatosis in children".

At the election of officers of the Triological Society, Dr. Schall was elected President for the coming year and Dr. Kenneth Day (*Otolar.* 1924) was chosen President-Elect.

Mr. Alan Feldman, Audiologist for the Winthrop Foundation for the Deaf, spoke before the Worcester Hearing League on May 8. Mr. Feldman discussed "Rehabilitation of hearing-impaired children and adults".

Dr. Edwin B. Dunphy, Chief of the Ophthalmic Service, traveled in Italy during the month of April. Dr. Dunphy visited several eye clinics. At the University of Parma he presented a paper on "The use of radioactive phosphorus (P^{32}) in the diagnosis of ocular neoplasms".

BIOGLET

Dr. Robert B. Rosen, Intern on the Children's Medical Service—born in Brooklyn, N. Y., August 13, 1921; military service: served with the 8th and 9th Air Forces in the ETO as Intelligence Officer, 1942-45; A.B., Brooklyn College, 1947; M.D., University of Rochester School of Medicine and Dentistry, 1952; home: Brooklyn, N. Y.

With some misgivings I have decided to make my contribution to THE NEWS an account of my own tour of duty in the Army, which in all honesty I must admit did me a lot of good. Since I was never stationed in this country, I was never exposed to the problems of dealing with difficult colonels, parades, dress uniforms, etc. which seem to have plagued our friend "Anon." whose article appeared in the May issue of THE NEWS. I can say that in the somewhat more relaxed atmosphere of overseas theatres, especially in the combat zones, these are not major problems and anyone schooled in the art of outwitting the administrative staff at the M.G.H. should have no trouble with a little Army brass.

All I can say about my brief stay at Fort Sam Houston is that they really do try to give credit for your residency training and to assign you according to your specialty. Certainly no one with whom I'm acquainted was grossly misassigned. Naturally, the more training you have the better chance you have to land the good jobs; but I saw several fast talkers, who were subsequently able to back up their claims, land very good jobs with only one year's training. In my own case, I got an assignment to a large hospital in Japan, albeit not one of the major surgical centers, where I was in charge of the general surgical patients.

Actually, our main task in that hospital was plastic reconstruction of Korean casualties. Fortunately, our Chief of Surgery was Lt. Col. Dave Fisher, whom some will remember from his year here with Dr. Cannon. He is a capable plastic surgeon and ran a very good service, where I certainly learned a lot of surgery. Moreover, I soon realized that most Army medical men of any worth are still primarily doctors and they treat you as much like what you have been used to in civilian life as possible. Aside from the surgical experience I was getting in Kobe, Japan, I was exposed to many other unusual and valuable situations and problems which are never encountered in this country. One of the clinical situations of note was the great prevalence of narcotic addiction in the troops, since Kobe is the narcotic center of the Far East now that Shanghai is out of the picture. During eight months there I saw at least half a dozen cases of acute intoxication from intravenous overdoses of heroin — the prevalent drug. A recent article in the *New England Journal of Medicine* gives an account of one of these cases in our hospital at that time. Heroin was so easily available that practically every rickshaw driver had it for sale, and we frequently had as many as thirty patients in the hospital who had become addicted from outside sources while being treated for other problems.

Of not inconsiderable interest was the opportunity to get to know the Japanese people, who ultimately must be our strongest allies if we are to succeed in Asia. Like all Asians, the Japanese are faced with the day-to-day problem of finding enough to eat, and one can't begin to understand how they look at political problems until he understands this more fundamental problem of the battle for survival which the Japanese must continuously wage. Our training leaves too little time for the consideration of this issue, and perhaps one of the most important things that the Army can do for us is to expose us to this problem and afford us a little time to think it through.

Finally, in Japan I had a chance to do a good deal of sight-seeing in what was to me one of the most beautiful countries in the world. At the time I was there the Army was running most of the large Japanese resorts as rest hotels, and you could travel anywhere in Japan and stay in a beautiful hotel for a dollar a day and eat steak and sea food for fifty cents a meal. At present most of these hotels have been turned back again to the Japanese, I understand, but a good many are still open to service personnel.

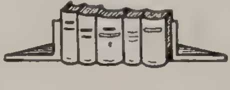
After eight months in Japan I was sent to Korea, where again I was on duty in a hospital — the first being the 121st Evacuation Hospital, outside Seoul. I hit there just at the time of the Heartbreak Ridge and Punchbowl battles of the fall of 1951. Nothing else that has ever happened to me approaches the emotional impact of landing in that Evacuation Hospital which handled 10,000 in that six-weeks' period. The forward units were completely swamped, and we were able to keep only the most serious cases that they passed on. Despite the strain, it was an experience I shall never forget. Needless to say, I had all the work any surgeon could want, although the rush of cases during that particular period prevented careful follow-up and some of the more complicated technical procedures which we were able to carry out when things became quieter later on.

In January of 1952 I was sent up to a Mobile Army Surgical Hospital on the eastern end of the front, about 15 miles from the line. While there we were able to get acquainted with most of the units we were caring for, which enabled us to identify ourselves more closely with the troops doing the fighting, and consequently made our work much more interesting, as we were able to follow the action. Our MASH had about 200 beds. We had four helicopters attached to our unit, which evacuated men right from the line in about twenty minutes. As a result, we were getting our casualties much sooner than was the usual case in World War II and were able to save a good many limbs by artery repair which would have been lost with longer delay. This vascular surgery was only one of the many clinical problems we handled, all of which will be of great value in civilian practice. Another lucky break for me was that the Surgical Research Team from Walter Reed Hospital happened to be stationed with us and we learned a great deal from their studies of shock and lower nephron nephrosis.

Certainly, the Army is willing to provide almost any aid in the way of equipment or consultant advice you might want. Moreover, the theatre surgeons interfered very little in what we did as long as our work was going well. Incidentally, it is of interest that Dr. Churchill's TBMED [Technical Bulletin Medical] on the management of battle casualties is still pretty much the standard text in this war, as it was in the last.

Korea is a miserable place and unbelievably oppressive during times of inactivity, but in the main I was occupied and doing interesting and worth-while work. I look back upon my year there as time well spent, even if time I definitely do not want to put in again. In fact, this is a good summary of my whole tour of Army duty, and I don't see why others expecting to be called can't do as well.

James M. Shannon, M.D.,
Assistant Resident in Surgery



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, *please,* remember to include that information. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Allergy

Burrage, W. S., and Irwin, J. W.
Microscopic observations of the intrahepatic circulation of living guinea pigs before and during anaphylaxis.
Ann. Allergy 11:137-142.

Burrage, W. S., and Irwin, J. W.
The role of cortisone in the treatment of severe bronchial asthma.
New England J. Med. 248:679-682.

Anesthesia

Beecher, H. K.
Rejoinder to Dr. James D. Hardy, Dr. Harold G. Wolff, and Miss Helen Goodell (Pain — Controlled and uncontrolled, Science 117:164-165).
Science 117:166-167.

Katzman, R., Villee, C. A., and Beecher, H. K.
Effect of increased carbon dioxide concentrations in fixed acid production *in vitro.*
Am. J. Physiol. 172:317-323.

Biochemistry

Ryan, K. J., and Engel, L. L.
The interconversion of estrone and estradiol by human tissue slices.
Endocrinology 52:287-291.

Ryan, K. J., and Engel, L. L.
The interconversion of estrone and estradiol-17B by rat liver slices.
Endocrinology 52:277-286.

General Medicine

Farnsworth, D. L.
Medical progress: Health in colleges.
New England J. Med. 248:543-552.

Jones, C. M., Benson, J. A., Jr., and Roque, A. L.
Whipple's disease: Report of a case with special reference to histochemical studies of biopsy material and therapeutic results of corticosteroid therapy.
New England J. Med. 248:665-670.

Stare, F. J., Waddell, W. R., and Geyer, R. P.
Current therapeutics, LXIV. — Clinical uses of fat emulsions.
Practitioner 170:413-418.

Stare, F. J., Waddell, W. R., Mann, G. V., and Van Itallie, T. B.
Nutrition.
In Medical progress, Philadelphia, The Blackiston Company, chap. 6.

Neurology, Neurosurgery, and Psychiatry

Brown, M. R.
Biographic sketch of Arnold Pick.
In Founders of neurology, Springfield, Ohio, Charles C. Thomas, pp. 202-204.

Brown, M. R. (with Tauber, L. N.)
Biographic sketch of Karoly Schaffer.
In Founders of neurology, Springfield, Ohio, Charles C. Thomas, pp. 207-211.

Brown, M. R.
Headache.
In Current therapy—1953, Philadelphia, W. B. Saunders Company, p. 625.

Pathology

Burt, A. S., and Castleman, B.
Some histological effects of estrogens and castration on the anterior pituitary in women with carcinoma of the breast.
Cancer 6: 236-247.

Physical Medicine

Watkins, A. L.
Betaine and glycocyamine in treatment of poliomyelitis.
New England J. Med. 248:621-623.
Watkins, A. L.
Serum neuritis: Analysis of sixteen cases.
Arch. Phys. Med. 34:231-234.
Watkins, A. L.
Team training for upper-extremity prosthetic service. (Editorial)
Arch. Phys. Med. 34:249-250.

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

On Wednesday, May 6, the MGH Staff Wives Hospital Committee held its annual meeting in the living room of the Walcott House. Coffee was served at 10:00 A.M., followed by the business meeting at 10:30. Mrs. Joseph C. Aub addressed the group briefly, announcing that a summary of this past year's activities would be mailed to each member within a few days. Mrs. Robert S. Palmer, Chairman of the Nominating Committee, then presented the slate for the coming year. The following officers were elected:

Chairman	Mrs. Edward D. Churchill
Vice Chairman	Mrs. Howard Ulfelder
Recording and Corresponding Secretary	Mrs. E. Peirson Richardson, Jr.
Secretary of the Executive Committee	Mrs. Grant V. Rodkey
Treasurer	Mrs. Bradford Cannon
Publicity	Mrs. John W. Raker
Hospital Projects	Mrs. Richard H. Sweet
Hospitality	Mrs. Joseph C. Aub
Volunteer Service	Mrs. Charles B. Burbank

Following the election of officers, Dr. Henry K. Beecher gave a very interesting talk on "Stress".

On Saturday, May 23, a picnic was held at the home of Dr. and Mrs. Bradford Cannon in Lincoln. Members of the House Staff and their families, as well as doctors who are with us from abroad and their families, were invited. The hospitality of the Cannons and the charm of their lovely country place make this one of the outstanding parties of the year.

Under the auspices of the Music Committee, the M.I.T.-Harvard Choral Group graciously presented a program for patients in the Moseley Rotunda at 3 P.M. on Wednesday, May 27. Staff Wives assisted in the moving of patients who wished to attend the concert.

Mrs. Richard H. Sweet, who has been in charge of the collection of used furniture to be placed at the disposal of doctors from other lands who are here at M.G.H., reports she now has a limited amount to offer. Included in the furniture and other household necessities are a number of refrigerators. She may be reached at Longwood 6-5671 if you have any furniture, curtains, china, or other items you can contribute that would add to the comfort or attractiveness of a temporary home. If you are a visiting physician and have need of furnishings, your problem may be solved by telephoning Mrs. Sweet.

Mrs. William H. Sweet and Mrs. Charles W. Cheney will arrange and place flowers in different parts of the Hospital on Monday and Friday of each week. Anyone who may wish to donate flowers for this purpose may get in touch with Mrs. Sweet at Aspinwall 7-3717, or Mrs. Cheney at Kirkland 7-2977. Contributions will be deeply appreciated.

Distaff Club

On Wednesday, April 29, the members of the Distaff Club attended a travelogue on "Japan, Korea, and points beyond" presented by Dr. Edward D. Churchill. During the months of January and February, 1953, Dr. Churchill and Dr. Paul W. Sanger of Charlotte, North Carolina, visited hospitals at various points round the world. At the same time they took advantage of the excellent subject material available for the use of Kodachrome film. Dr. Churchill showed the group some beautiful sections of Japan, Korea, Thailand, India, and Greece, plus photographs taken from the airplane. With each picture there was a story concerning either the people or the country. Our group was taken on a most enjoyable trip by Dr. Churchill.

Brief bits:—

Dr. Louis Bakay took part in the 5th South American Congress of Neurosurgery, as guest of the Peruvian Government. The Congress was held in Lima, April 12-18.

Dr. Walter S. Burrage presented a motion picture before the American College of Allergists in Chicago on April 27. The film was prepared in the MGH Allergy Laboratory. Its title was "Microscopic observations of the intrahepatic circulation of living guinea pigs before and during anaphylaxis".

Dr. Edwin F. Cave lectured in New Haven on April 29 before the Connecticut State Medical Society. His subject was "Knee disability due to derangement of the patella".

Dr. Earle M. Chapman went to the American Goiter Association meeting, held in Chicago May 7-9, to give a paper on "Ten years' experience with radioactive iodine treatment".

Dr. John W. Irwin spoke before the American Academy of Pediatrics at the Statler Hotel in Boston on April 20. His subject was "ACTH and cortisone in pediatrics: Effects on allergic reactions".

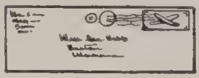
Dr. George D. Parker (*Dn.* 1939) announces the opening of his office for the practice of Dentistry and Dental Surgery at 138 Adams Street, Monte Vista, Colorado.

Dr. Judson A. Smith left the first of April for a five-weeks' vacation in Europe. He visited Italy, Sicily, the Isle of Capri, and France, and toured southern England by automobile. He flew the Atlantic both ways.

Dr. David Stafford-Clark, a Fellow in our Psychiatry Department in 1950 and now a member of the staff at Guy's Hospital in London, has sent us a copy of his new book, *Psychiatry to-day.* It is a 300-page volume, published by Pelican Books, and is available in this country.

Dr. William R. Waddell attended the third Middle East Medical Symposium at the American University of Beirut, Lebanon, April 17-19, and spoke on the subject "The role of intravenous fats". After staying there in Beirut with Dr. William D. Shorey (*E.S.* 1946) for a week after the meeting, he then enjoyed a short sight-seeing tour.

Dr. James C. White was invited to give the Hughlings Jackson Lecture at the Montreal Neurological Institute on May 13. His subject was "Conduction of pain in man: Observations on its afferent pathways within the spinal cord and visceral nerves".



Here is news of the interesting work being done in Guatemala by Dr. Rodolfo E. Herrera (*E.S.* 1943) — our "singleton" past resident down there:

Five years have gone by since I started practising in Guatemala City. They have gone by fast, although the pace here is slow if judged on the basis of West Surgical standards.

My activities have been divided between ward and private practice. Our public health system is so set up that it is easy to be connected with it. As a result, I have been president of the Guatemalan Antituberculosis League, and am now president of the National Counsel for the Control of Tuberculosis. The charity work has consisted of organizing the surgical service of the Chest Hospital — a 300-bed institution — where I am Chief of Surgery and work there three times a week. Private practice has consisted of organizing a group and building a small private hospital. Our group is made up of men all trained in the U. S. We have recently enlarged from six to ten members and we have just finished the construction of our hospital. It should be ready to open in about three months, and will allow us to take care of our patients under close to ideal conditions, which has not been the case up to now.

My work has been about equally divided between thoracic and abdominal surgery, without much contact with isotopes and positrons. We have done some work in the dog lab and we have, of course, organized medical meetings to present it. I also happen to be on the editorial board of the *Journal of the Guatemalan Medical College,* to make sure the work gets published. This is, as you see, a chain roughly comparable to growing corn and manufacturing corn flakes.

Ben Castleman, your Acting Chief of Pathology, visited us recently and gave a series of lectures and CPC's. He attracted larger audiences than any previous medical lecturer, and we hope he is the first in a long line of MGH visitors we will have the pleasure of seeing in Guatemala. The country is quite beautiful and there are ample opportunities for fishing, hunting, and water-skiing — the latter our favorite pastime on Lake Atitlan — all of which deserves a detour when a Bostonian travels south of Dedham. Edward Shannon (r.s. *N.S.* 1944) has liked it enough to come down three times in two years.

I have been delighted to see that we have six Guatemalans getting training at the M.G.H. This represents an important statistical percentage of our population. If the same proportion of the Chinese were at the M.G.H., all of the staff and non-professional personnel of the Hospital (including Mike, the elevator man) would have already been replaced by Formosans.

I certainly hope that all my fellow countrymen at the M.G.H. will return to work with us. I am ready to change the name of our group from "El Centro Medico" to "The MGH Associates of Guatemala"!

Best wishes to all at the Massachusetts General.

Our decision to send out "singleton" letters is paying off handsomely. Already, several delightful responses have arrived — this one no less so. It comes from Dr. Paul W. Harrison (*E.S.* 1909), from the American Mission Hospitals, Bahrain, Persian Gulf.

It gave me quite a thrill to get a letter from you and be invited to make a report as of the only center of MGH light and leading in this part of the world.

We reckon ourselves as part of Arabia, though Bahrain, as a matter of fact, is a small island about twenty-five miles from the coast of the actual peninsula.

In the old days this was a pearl-diving community, and while there was not so much to eat and wear then, the community was more of a homogeneous unit. The evil eye is still reckoned as the major cause of disease. Right now the evil eye has the edge on the rest of us for a bad case of tetanus died in the Hospital this morning, with no scratch on her skin, no history of recent delivery, and no other cause. I think it must be very convenient to be able to fall back on the evil eye.

We used to have malaria for breakfast, dinner, and supper, but that is a thing of the past, fortunately. One of the good things the oil money has done for us is to make possible some very effective health measures, and from this island, at least, that disease is due to really disappear.

We have lots of malignant disease here, especially cancer of the stomach, and here the eye is especially evil for the patients never get to us until all chance of complete cure is entirely gone. I used to do palliative gastroenterostomies, but the patients seem to get a longer period of relief, before they go under, with a subtotal resection.

We do a good many hernias here, too, and at the moment we are experimenting with an injection method, making use of a different solution from those which were used before. It really is not a solution at all, but rather a suspension of asbestos particles, and so far as four years' experience goes the fibrosis they induce is permanent. We will probably be making a report on this eventually, if the late results seem to be good.

We have a good deal of tuberculosis, also — a hold-over from the days of pearl-diving. In those days all the divers spat blood the first two weeks of the season on account of the cold water. Their diet was poor and everybody was thin and undernourished. Now, with the oil companies here, the income of the people has gone up and their work is less of a tax on the lungs. It is only a question of time, we hope, till tuberculosis disappears.

Politically, we are off at one side of the heavy currents and controversies elsewhere in the Middle East, and we hope we can remain that way.

And, finally, your name makes me remember that when I was senior on the East Surgical, my pup (house pupil, for long) was Charlie Holbrook. He was a good pup.

Very warm appreciation of your writing and sincere regards.

No. 125 Boston, Mass. July and August 1953

INSIDE EUROPE — 1953

Invitations to speak in Berlin and Vienna, and possibly to operate at the famous Allgemeinen Krankenhaus in Professor Denk's clinic in Vienna, were sufficient impetus to investigate the air routes to Europe this past February. As I needed an interpreter because my German is chiefly of high school vintage, and whereas Mrs. Linton's is good, that selection was not difficult to make.

Our Pan-American Super D-6, the fastest American commercial plane, roared down the runway at East Boston on February 18 at 3 P.M., nonstop to Iceland. The luxury of cocktails before dinner was missed, as we were traveling air tourist instead of first class, at a saving of $200 each, which seemed more than a few drinks were worth. Our first stop was at Keflavik, Iceland, where we were greeted by one of my patients, Miss Kolbrun Olafsdottir, a former member of the 1946 Icelandic Olympic swimming team, and her parents. Despite the fact that it was 3 A.M. in Iceland, we had a very pleasant visit. Few postoperative check-ups in my experience have given me so much pleasure, because the patient and her parents were so enthusiastic with the result we had accomplished at the Baker Memorial in reducing her huge right leg (due to elephantitis) to the size of the left normal one. The captain of our stratoliner kindly held up our departure for a short time, since we were ahead of schedule, so that I could do a careful examination of the patient. We left Iceland at 4 A.M. The next stop was made at Prestwick, Scotland, for fuel, and then on to Frankfort, Germany, our jumping off place for the little island in a big Red sea—Berlin.

A short tour of Frankfort showed it well on the way to recovery, what with much help from the U.S.A., as all the other places outside the Soviet sphere showed—even to the complete restoration of the old Goethe home, which had been badly bombed.

At 8:30 P.M. we left in an overcrowded DC-4, but fortunately still a Pan-American plane, for Berlin. Despite fog, a routine landing was made at 10 P.M. at the huge Templehof Airfield in the center of Berlin—the former parade ground for the Kaiser's armies—about twenty-four hours after leaving Boston. A welcoming committee of Berliners greeted us. They were so pleased and thrilled to meet the lady, Mrs. Linton, who had packed and sent much clothing and many CARE packages to them and also to less fortunate ones in the Soviet Sector of Berlin. Excellent hotel accommodations were arranged at the Flughafen Hotel at the airport.

The following day was a busy one, including a visit to the Templehof refugee camp in some of the old military barracks. The conditions were crowded, but on the whole it seemed quite sanitary. However, as one entered the building there was the typical odor of a stable, even though there were no livestock other than humans within miles. Doctors and nurses were in attendance, but the medical care was of the simplest. In one room a volunteer woman in charge of the young children—about 40 or 50 of them—was teaching them to sing and dance. The majority, although quite well nourished, seemed never to have known what it was to smile or laugh. The matron in charge was doing an excellent job in getting them to do so. Many of the men were in the bunk rooms, either reading or wrapped up in their thoughts. It seemed too bad, with so much that should be done in cleaning up the premises—and even Berlin itself, where there is still much rubble about—that these able-bodied ones could not be put to some kind of work.

In the afternoon I toured parts of the Western Sector of Berlin with a very competent guide—a former artillery officer of World War I—who finally left the military service when Hitler came into power in 1933, and became a newspaper correspondent. We traveled to the edge of the East Sector, but did not venture across because of the danger of never returning. Unknown to me, Mrs. Linton had done what men do not dare to do: she had gone into the Russian Sector with her nurse friend to attend the World Day of Prayer Service in Marienkirche, the oldest church in Germany. The church, as are all homes in the Russian Sector, was without heat. Two days later the minister of Marienkirche was abducted after the evening service. Fortunately, Mrs. Linton and her friend were unmolested; but while there, they did not dare converse for fear that Mrs. Linton might be detected as an American. She was also protected, probably, because of a bright red hat she was wearing!

The Russians seemed to be playing up the Rosenberg affair. Large posters were seen showing their pictures, with "AMERICA" above them, and beneath a large caption, "PARADIES!!", telling how they were martyrs to the cause of freedom. Even standing in the West Sector and looking across to the East, the difference between the freedom of the inhabitants was apparent. On the side of the street that was Western, one could see hundreds of people walking along the sidewalk or going into the innumerable little shops; whereas, on the Eastern side, one could see, at most, perhaps half a dozen people looking straight ahead, not across at the more fortunate. No shops were to be seen on that side.

My tour continued on to the Brandenburg Tor which still stands, but instead of the famous statue of horses on top, one now sees the Red flag of the Communists which flies day and night. The remains of the old Reichstag are still standing amid all the other ruins of recent bombings. I supposed it had suffered the same fate as the other buildings, but was told that Hitler himself had caused its destruction. Unter den Linden was "verboten", since it is in the East Sector, but from all I could see little remained of this famous street except that it was repaved. The Swiss Legation building was the only one in this whole area which had escaped serious damage. Hitler's chancellery was a mass of rubble near the Brandenburg Tor and, according to my guide, he was absolutely sure Hitler had perished in it. From what could be salvaged of it, the Russians built a war memorial which stands on the Charlottenburger Drive about a quarter of a mile within the British Sector. It was constantly guarded by a Communist soldier with his automatic rifle. Nevertheless, he permitted his photograph to be taken. Across the street the famous Tiergarten has disappeared, since its trees were cut down for fuel for cooking in the homes of Berlin immediately after the war.

The remainder of the afternoon was spent seeing some of the famous old Berlin landmarks, some badly bombed and others not. The most optimistic note shown by these people was the fact that they were tearing down the bunkers—that is, the bomb shelters—or attempting to, at least. They had been very strongly built. It seemed to me, with the war clouds so ominous, that they would have kept them for future use, but instead they were slowly being pulverized to be used for new building material and perhaps to help erase the memories of the siege of Berlin.

A pleasant evening was spent with a medical doctor and his family. Both he and his wife work long hours but receive little pay. When the door was opened by a very beautiful young girl, the oldest daughter in the family, something about her seemed familiar—as if I had seen her before. I soon discovered why. She was wearing one of Mrs. Linton's dresses that I had helped her choose some years ago. Mrs. Linton also recognized the dresses on the other children and the wife of the doctor, since she had packed them and sent them over from headquarters at our church in West Newton. It was surprising how well the dresses looked and, needless to say, how grateful the wearers were to have them. Our dinner was plentiful but simple—frankforts (long ones) and potato salad. It is difficult to comprehend what would have been the fate of these people without the good old Irish tubers. Starvation, undoubtedly, worse than it was. Butter also seemed very plentiful so, as a result, the people were well nourished on the whole.

Next day I performed my official duty in Berlin, giving a lecture at the 279th Station Hospital and making rounds with Colonel Churney. While this was going on Mrs. Linton was on a china shopping tour with the Colonel's wife, and what Mrs. Churney doesn't know about German china probably isn't worth knowing.

The following day we toured the Western Sector of Berlin, mostly on its perimeter, with our doctor friend, in his little volkswagen automobile. One of the most memorable events on this trip was seeing the new Government Building and hearing the Freedom Bell toll out its message. I believe the bell effects an important tie between free people and, as I told them over there, we hope it long may ring. It was on this trip that I almost became famous, because later that evening I discovered my passport was nowhere to be found! All the police stations in West Berlin were alerted in case it was turned in; and the next morning I notified the American consul, but nothing could be done that day to furnish me with a new passport because Washington's birthday had fallen on Sunday, and Monday was a holiday even in far-off Berlin. Perhaps that was fortunate because, much to my relief and to confirm the consul's opinion that the passport was not really lost, my doctor friend found it under the seat of his volkwagen. This called for a celebration, so we all went to Berlin's new and famous French restaurant for dinner that night. It has an excellent cuisine and I'm sure our German friends enjoyed the food even though it was French, which did not occur to me until we were on our way home.

The next day we left the little island in the big Red sea for Vienna via Air France, by way of Munich. An hour's tour showed what a difference in restoration had taken place in a city well outside the Russian influence. Despite 65 percent destruction by bombing, the business section had been built up to a surprising degree and the rubble carted away. Hitler's house and Eva Braun's house, strangely, showed no damage. The famous beer hall where Hitler was almost killed late in the war is now an American snack bar.

The next stop was Vienna, where we first saw the sunshine—actually and figuratively. Here in this jewel of a city the people seemed more lighthearted and friendly than in Berlin, even though everyone was constantly reminded of the Communists because their soldiers were always in evidence and the big Red star with hammer and sickle was hanging on a building on the Ringstrasse. But it was encouraging to see the flags of the United States, Great Britain, and France flying beside that of Russia on a nearby building. Not only did one move around freely in the International Sector, but we were not aware most of the time of which sector we were in. Unlike Berlin, where only three flagpoles have flags flying at the Four-Powers Building, in Vienna one sees all four side by side—the French, the Russian, the American, and the British, in this order on top of the building.

Two lectures, one before the Society of Surgeons of Vienna on the treatment of aneurysms by the intrasaccular wiring method, and the other on the surgical treatment of bleeding esophageal varices before the Society of Internists of Vienna—both at the Allgemeinen Krankenhaus, and the wiring of two thoracic aneurysms in Professor Denk's clinic constituted my official duties.

Excellent medicine and surgery are still practised at the Allgemeinen Krankenhaus, although the buildings are somewhat antiquated. In spite of crowded wards, the patients receive good care. All the beds are supplied with trapezes, which certainly should be copied at the good old M.G.H. The operating rooms, as elsewhere in Europe, double up frequently like the old East Surgical room at the M.G.H., with two operations going on at the same time. Although my lectures were in English, except for my slides which I had made up with the help of Dr. Schmidt of our Anesthesia Department, I had to resurrect some of my high school German to get the correct instrument at the operating table. Fortunately, the wiring of an aneurysm is pretty much a one-man job except for opening and closing the chest, so on the whole everything went very well—and why shouldn't it have done so with Professor Denk as my assistant!!

The Allgemeinen Krankenhaus is a tremendous hospital, with about 3,000 beds and covering approximately a space the size of Boston Common. It is subdivided into many clinics. Fortunately, within the grounds are many green lawns and trees. The concrete bunkers for protection against bombs still stand, since it is almost impossible to demolish them without demolishing the hospital at the same time. Because of the somewhat antiquated buildings, the Vienna doctors told me they had hoped much of it would be destroyed during the war instead of the business section of town so that new hospital buildings could be erected. Strangely, little if any damage by bombing resulted to this sprawling institution, which to me seemed fortunate, as it was with a sense of deep respect and homage that I visited these surgical shrines of Billroth, Semmelweis, Eiselberg, Wertheim, and others.

Mrs. Linton had an enjoyable visit and tour of the Rathaus with the Vice Burgomaster of Vienna, and later I joined them to visit Klosterneuburg Monastery—a site few foreigners are privileged to see. This pleasant interlude in Vienna was made possible by our introduction to the Vice Burgomaster through his daughter, Traudel, who is attending Mount Holyoke College with our oldest daughter, on a Fulbright scholarship. An enjoyable evening was spent at the opera, hearing Aida. The star was Karla Martinis, who played the part of Aida and sang beautifully. Unfortunately, the opera house had been bombed during the war and is not yet completely restored.

It was possible to motor through a great deal of Vienna, the Vienna woods, and to enjoy the view from Leopoldberg, looking down on the blue Danube. The pine boughs hanging outside the wine shops, telling us that the new wine was ready to drink, were enticing, but unfortunately we were always in too much of a rush to stop. A visit was made to a sport shop, however, where I purchased a pair of Norwegian skis made from American hickory! These were obtained at a reasonable price and proved to be excellent ones.

On our way to the railroad station Saturday morning, I informed our taxi driver that I still wanted to take some photographs, especially of Russian things, and most of all I wanted to take a picture of the building with the huge Red star with the hammer and sickle in the middle of it. He disapproved strongly of this suggestion, finally agreed to drive by the various sights I wanted to photograph, but said that under no circumstances would he stop, and that if I wanted photographs I would have to take them from the taxi window. Fortunately, all the assignments were obtained and, I believe, without inciting any international incidents.

Our train ride to Bad Gastein for skiing was pleasant, even though by third class. At the river Enns, where the Russians boarded our train and asked for passports and gray cards, we bade goodbye to them. Without the proper papers we would not have been allowed to travel further, but would have been taken off the train and put in charge of the soldier standing guard with his automatic rifle outside our train. The Russian official seemed very young—hardly twenty years of age. He said the one word, "Passport" in Russian, looked at our papers, then left the compartment without a glance at any of us.

At Bad Gastein excellent skiing was found on the Stubnerkogel at an altitude of 2,245 meters. The chair lift was of the latest variety, each holding four people and the skiis, and all enclosed with windows so the view could be enjoyed and the passengers still protected from the wind. The run was about 10 kilometers—the upper half alpine skiing on open slopes, the lower through the forest trails, like those in New England, and finally through the pastures and barnyards to the railroad station of Angertal. The return to Bad Gastein was by train or bus, for the sum of ten cents. Chair lifts to other runs were available up the opposite side of the mountain from the Stubnerkogel, but with less open running. Another one was reached from Hofgastein, a neighboring village.

The town of Bad Gastein has been for centuries a health resort where Europeans have gone for mineral water baths and rest cures. With the coming of the atomic age and the Geiger counter, the naturally heated waters have been found to be slightly radioactive. By some it is now claimed that this property explains the beneficial response that many ailing executives and neurotics derive, forgetting perhaps that the baths can be taken only by a doctor's prescription and that no benefit can be derived unless the period of treatment lasts at least a period of three weeks. As a result of this business, the town consists practically entirely of hotels. Some are small, but many are huge, with hundreds of beds. In the town museum it was of interest to see that the peak years for visitors were 1940 and 1944, just before the crumbling of the Nazi empire—probably not surprising. Though undoubtedly visited by Hitler, his hotel and bedroom were fortunately not advertised, I presume, because we were in Austria. The number of visitors is again beginning to rise since the end of the war, due in part to the new skiing facilities that have been installed. With so many hotels idle in the winter, it naturally became an excellent resort for the skier as soon as the ski lifts were installed. Most of the hotels are arranged one above the other on the precipitous sides of the valley, so in addition to the exercise of skiing one obtains even more of it by climbing up and down the streets, none of which are on the level.

Our ski guests and companions were three Austrians—Dr. E. von Hueber, Mr. R. von Hueber, his brother, and Dr. Tauler, a native of Bad Gastein. We were also joined by Mr. and Mrs. Selden of Andover, Massachusetts, and Mr. Horace Bright of Cambridge, Massachusetts. After five days of skiing and relaxation we decided to move on, so we bade farewell to our Austrian friends and headed for Switzerland. We were tempted to get off at Innsbruck and also at Zurich, but we were anxious to reach the bigger and better ski region of Wengen, Switzerland. After a good night's rest at the Hotel Bauer au Lac, we hired a taxi the next morning for a very nominal fee and drove to Lauterbrunnen. This proved to be a very interesting trip, with a young university student as our chauffeur. In addition to being a good driver, he also was an excellent guide—taking us to interesting places on the route, including the city of Lucerne. This means of travel saved four changes of trains that would have been necessary, with the trouble of moving our luggage and skis each time—an inconvenience of railroad travel in Europe that can be appreciated only by those who have experienced it.

Wengen was reached by a cog railway from Lauterbrunnen. It is a cozy little village tucked onto the side of the foothills, looking up to the Jungfrau. The accommodations at the Silber Horn Hotel were pleasant though not overly sumptuous; but the skiing, the ski lifts, and the cog railways we found hard to beat. The ski runs, to name a few, were wonderful from Kleine Scheiddig down to Grindelwald, a T-bar lift from Kleine Scheiddig up to Lauberhorn, then down to Wengen Alp or Wengen itself through new powder snow. The glacier tours on the Eismeer and the Aletsch glacier, reached by cog railway which has been drilled out of the center of the Jungfrau, offered some wonderful skiing—especially the former, as the slopes are steeper and the snow was virgin powder where other skiers had not marred the surface. After five days of this skiing, with the longest run of twenty miles, it was hard to leave, but we did—to see Paris in a day!

This was accomplished, but left much for another visit. Most of the sights seen on the morning and afternoon tours were chosen to show us the glory of France's past military history and conquests—very similar to what we were shown in Berlin, Vienna, and Munich. It was depressing to learn from our guide in Paris that if he showed us Pasteur's monument, which can be seen in the distance from Napoleon's tomb, he would lose his job. Pasteur—one of the greatest benefactors to mankind.

Much can be learned from history, but much should be forgotten. Even in Ireland the next day, on a tour of Limerick while waiting for our plane to be repaired, our genial Irish driver showed us the Stone Monument commemorating a treaty between the Irish and the English in the 13th century, and told us the treaty had been broken before the ink with which it was signed had dried. It is unfortunate that the peoples of the European countries continue to live so much in the past instead of looking forward to the future. They still glory in the victorious military regimes of previous years, apparently not taking into consideration that about all that was accomplished by these wars was to kill off the cream of the youth of many nations; and, furthermore, because of this worship of the past they seem to continue to embitter each succeeding generation, thus laying the seeds for future wars.

Robert R. Linton, M.D.,
Visiting Surgeon

* * *

Dr. Fritz Lipmann received the following letter from Dr. Lawrence A. Kimpton, Chancellor of the University of Chicago:

> I have the honor to inform you that the Board of Trustees of the University of Chicago, upon the recommendation of the Faculties, proposes to confer upon you the honorary degree of Doctor of Science at the Convocation to be held on Friday, June 12, 1953.
>
> It is my hope, both personally and on behalf of the University, that you will permit us to have the privilege of recognizing your achievements on this occasion. Will you let me know if the proposal to confer the degree is acceptable to you and whether it is possible for you to attend the Convocation at three o'clock in the afternoon of June 12. . . .

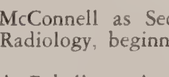
On June 8, President Harold C. Case of Boston University, in presenting degrees at the June Commencement Exercises, conferred the honorary degree of Doctor of Humanities upon Miss Ruth Sleeper, Director of our School of Nursing and Nursing Service.

In making the award President Case said, "Ruth Sleeper, Director of the School of Nursing and Nursing Service, Massachusetts General Hospital, since 1946; Past President of the National League of Nursing Education; First President of the new National League for Nursing; distinguished leader in the improvement of education and the use of the services of nurses; exponent and friend of international good will: You have given nursing graciousness, and by improving its standards you have enhanced the health for many people. On the recommendation of the University Council, and by the authority of the Trustees of Boston University acting under the Statutes of the Commonwealth of Massachusetts, I confer upon you the degree of Doctor of Humanities, and admit you to all the honors, privileges, and responsibilities thereto appertaining."

* * *

Miss Ida M. Cannon, a pioneer in the field of medical social work and head of our Social Service Department from 1907 until her retirement in 1945, celebrated her 50th anniversary as a member of the National Conference of Social Work when she attended the 80th annual meeting of the NCSW in Cleveland last month.

Among many other activities, Miss Cannon is a trustee and corporation member of the Bay State Society for the Crippled and Handicapped, Inc., and a member of the advisory board of the Massachusetts State Department of Public Welfare. She is the author of many articles on social work. The title of her latest book—*On the social frontier of medicine*—was included in the list of staff publications in our February issue.



The Board of Trustees, at their meetings during May, voted:

To accept with regret the resignation of Dr. Harley C. Shands, Assistant in Psychiatry, effective May 14.

To appoint:

Dr. Charles F. Goodnough as Assistant Resident in Anesthesia for one year, beginning October 1;

Dr. Fleming McConnell as Second Assistant Resident in Radiology, beginning January 1, 1954;

Dr. Désiré J. A. Rebello as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Paul S. Russell as Second Assistant Resident on the Surgical Service, beginning July 1;

Dr. Robb H. Rutledge as Third Assistant Resident on the Surgical Service, beginning July 1;

Dr. Albert Van Eerde as Assistant Resident in Anesthesia, beginning March 1, 1954;

Dr. Edward W. Webster as Physicist in the Department of Radiology, beginning October 1;

Dr. Ruth S. Weiss as Assistant in Psychiatry

at the McLean Hospital, beginning July 1, 1954;
Dr. Roger E. Wilcox as Second Assistant Resident on the Surgical Service, beginning July 1.

At their meetings on April 29, May 13, 20, and 27, and June 3, the General Executive Committee voted:

To promote the following, on the Surgical Service, beginning July 1:

Dr. John D. Constable to the position of Third Assistant Resident;
Dr. Richard R. Curtin to the position of Third Assistant Resident;
Dr. Ira A. Ferguson, Jr. to the position of Third Assistant Resident;
Dr. Donald J. Glotzer to the position of Third Assistant Resident;
Dr. Sigurd B. Gundersen, Jr. to the position of First Assistant Resident;
Dr. William H. Hendren, III, to the position of Third Assistant Resident;
Dr. Charles E. Huggins to the position of Third Assistant Resident;
Dr. Benjamin B. Jackson to the position of Third Assistant Resident;
Dr. John A. Malcolm to the position of Third Assistant Resident.

To continue the appointment of:

Dr. Thorkild Wainφ-Andersen as Clinical Fellow in Anesthesia for one year, starting May 18.

To appoint:

Dr. John S. Barlow as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Jean G. Cadilhac as Research Fellow in Neurology, assigned to the Electroencephalographic Laboratory, retroactive to April 1 and continuing through July 31;
Dr. Robert A. Cleghorn as Clinical Fellow in Psychiatry, beginning September 1;
Dr. Eino I. Kulonen as Research Fellow in Medicine, for the period April 15 through June 13;
Dr. John F. McGinty as Clinical Fellow in Medicine, assigned to Cardiology, effective as of May 27;
Dr. Guillermo C. Sanchez as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Dr. William Sharpe, Jr. as Clinical Fellow in Psychiatry, beginning July 1;
Dr. Rhett Talbert as Clinical and Research Fellow in Neurology, for a period of six months, beginning July 1;
Dr. Heribert L. Thaler as Research Fellow in Medicine, effective when he arrives in this country from Austria;
Dr. Albert Van Eerde as Clinical and Research Fellow in Anesthesia, for the period July 1, 1953 through February 28, 1954.

On May 4, Dr. Virginia B. Calkins was appointed Clinical Assistant on the McLean Hospital Staff.

* * *

THE CLINIC FOR ALCOHOLISM

The Clinic for Alcoholism was established in the Out-Patient Department of the Hospital in the spring of 1951. It operates with funds provided through the Department of Preventive Medicine, Division of Alcoholism, of the Commonwealth of Massachusetts. In the fall of 1952 it was decided by the State to designate this Clinic as a center for study and research on the problems of alcoholism.

Since this time, the Clinic has been operating five afternoons weekly with the services of one psychiatrist who works half time, two other psychiatrists who work one afternoon each week, a full-time social worker, and a secretary. Since January of 1953, the Clinic has been able to utilize the part-time services of a clinical psychologist. Conferences of the Clinic staff are held each Wednesday afternoon at 4:00 P.M. Anyone interested in the problem of alcoholism is cordially invited to attend.

Progress in the therapy of alcoholism has been greatly hampered by the generally prevalent attitude of hopelessness and futility among the medical profession in regard to the problem. In this respect, it is significant that over half of the sixty-three patients followed during the year 1952 have been benefited by treatment. It must be emphasized, however, that while "benefit" denotes cessation or diminution of the severity of pathological drinking and while this contributes a very useful social result, it does not constitute a cure. These individuals continue to be in danger of resorting to alcohol as a means of dealing with conflicts or stress.

No substantial progress in the management of the problem of alcoholism may be hoped for unless an intensive study of all phases of the problem are carried out. It is the aim of the Clinic to undertake such a study, covering the psychiatric, medical, neurological, and social aspects of alcoholism. Only when sufficient valid data regarding the dynamic etiologic factors have been accumulated, can one hope to evolve practical and successful therapeutic methods. In order that extensive individual psychiatric study of each patient can be carried out, it will be necessary to add to the psychiatric personnel of the Clinic staff. It is planned, also, to utilize the services of an internist in order to study and treat the medical complications secondary to alcoholism. Dr. Raymond D. Adams and Dr. Maurice Victor have already carried out extensive studies on the neurological complications of alcoholism, and it is planned to enlist their closer cooperation in the work of the Clinic.

The rehabilitation of the alcoholic patient demands certain special considerations. The present attitude of moralistic judgment, hostility, and hopelessness toward these patients, which stems largely from a lack of understanding of the problem, must be replaced by an objective approach, as with any other illness. Only such an attitude, coupled with patience and the willingness and ability to provide much support, can hope to hold these extremely disturbed, insecure, and suspicious patients in treatment. An extensive educational program will be necessary in order to achieve this end—not only with the public, but with the medical and nursing professions as well.

In addition to a shortage of trained medical personnel on the staff of the Clinic, one of the most pressing needs is adequate facilities for hospitalization of the patients. The nature of their illness necessitates hospitalization for short periods following episodes of prolonged intoxication with or without the complication of delirium tremors, psychosis, or neuropathy. However, there is an even more urgent need for facilities for interim hospitalization at times of stress, for purposes of support or to forestall renewed drinking, as well as for longer periods of "partial hospitalization" during convalescence for such patients who may need the support of a protective environment at night even though they may be able to work during the day.

Our limited experience has already demonstrated that individuals with alcoholism can be treated with some hope of success. Much further study and understanding will be required before we can evolve treatment methods which are adequate to cope with the enormous magnitude of the problem of alcoholism.

Alfred O. Ludwig, M.D.,
Associate Psychiatrist
and *Director of the Clinic for Alcoholism*

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in many instances. It would save your editor considerable time and trouble if you would, PLEASE, REMEMBER TO INCLUDE THAT INFORMATION. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Cardiology

Cohen, M. E., Robins, E., Purtell, J. J., Altmann, M. W., and Reid, D. E.
Excessive surgery in hysteria: Study of surgical procedures in 50 women with hysteria and 190 controls.
J.A.M.A. 151:977-986.

Currens, J. H., Thompson, W. B., Rappaport, M. B., and Sprague, H. B.
Clinical and phonocardiographic observations on the Flint murmur.
New England J. Med. 248:583-587.

Rappaport, M. B., Sprague, H. B., and Thompson, W. B.
Ballistocardiography. I. Physical considerations.
Circulation 7:229-246.

Thompson, W. B., Rappaport, M. B., and

Sprague, H. B.
Ballistocardiography. II. The normal ballistocardiogram.
Circulation 7:321-328.

White, P. D.
Alteration of the pulse — Still a common and important clinical condition.
Mod. Concepts Cardiovas. Dis. 22:174-176.

White, P. D., King, R. L., and Jenks, J., Jr.
Medical intelligence: The relation of heart size to the time intervals of the heart beat, with particular reference to the elephant and the whale.
New England J. Med. 248:69-70.

General Medicine

Dobyns, B. M., Vickery, A. L., Maloof, F., and Chapman, E. M.
Functional and histologic effects of therapeutic doses of radioactive iodine on the thyroid of man.
J. Clin. Endocrinol. & Metab. 13:548-567.

General Surgery

Bartlett, M. K., and McDermott, W. V.
Surgical treatment of diverticulitis of the colon.
New England J. Med. 248:497-499.

Laboratory Science

Baddiley, J., Thain, E. M., Novelli, G. D., and Lipmann, F.
Structure of coenzyme A.
Nature 171:76-77.

Bucher, N. L. R.
The formation of radioactive cholesterol and fatty acids from C^{14}-labeled acetate by rat liver homogenates.
J. Am. Chem. Soc. 75:498.

Crane, R. K., and Lipmann, F.
The effect of arsenate on aerobic phosphorylation.
J. Biol. Chem. 201:235-243.

Crane, R. K., and Lipmann, F.
The relationship of mitochondrial phosphate to aerobic phosphate bond generation.
J. Biol. Chem. 201:245-246.

DuToit, C. H.
The effects of thyroxine on phosphate metabolism.
In Phosphorus metabolism, vol. 2, McElroy, W. D., and Glass, B. (Editors), Baltimore, The Johns Hopkins Press, pp. 597-617.

Elliott, W. H.
Isolation of glutamine synthetase and glutamotransferase from green peas.
J. Biol. Chem. 201:661-672.

Hall, T. C., McCracken, B. H., and Thorn, G. W.
Skin pigmentation in relation to adrenal cortical function.
J. Clin. Endocrinol. & Metab. 13:243-257.

Hoch, F. L., and Lipmann, F.
Inhibition of mitochondria phosphorylation by thyroxin.
Federation Proc. 12:218.

Lipmann, F.
On chemistry and function of coenzyme A.
Bact. Rev. 17:1-16.

Maas, W. K.
Synthesis of pantothenic acid by a pyrophosphate-liberating cleavage of ATP.
Federation Proc. 12:241.

Maas, W. K., and Novelli, G. D.
Synthesis of pantothenic acid by depyrophosphorylation of adenosine triphosphate.
Arch. Biochem. & Biophys. 43:236-237.

Novelli, G. D., and Hoagland, M. B.
The enzymatic degradation and resynthesis of coenzyme A. (Abstract)
In Abstracts of papers, 123rd Meeting, American Chemical Society, March 16-20, pp. 26C-27C.

Schmid, K.
Isolation and characterization of glycoproteins from human plasma.
J. Am. Chem. Soc. 75:2532.

Neurology, Neurosurgery, and Psychiatry

Abrams, R. D., and Finesinger, J. E.
Guilt reactions in patients with cancer.
Cancer 6:474-482.

Rounds, F. W., and Rounds, C. E.
The principles and technique of exodontia.
St. Louis, The C. V. Mosby Company.

MASSACHUSETTS EYE & EAR INFIRMARY

On June 9, Dr. Frederick H. Verhoeff, our Consulting Chief of Ophthalmology, was awarded a Doctor of Laws degree by Johns Hopkins University, where he had attended medical school. The degree was given in recognition of his outstanding work in ophthalmology. Dr. Verhoeff has been associated with the Infirmary since 1900, and is on the staff at Harvard Medical School, where he is now a Professor *Emeritus*.

Dr. Andrew A. Eggston of New York was the guest speaker at the regular Spring Meeting of the New England Oto-Laryngological Society, held on June 17 in the Upper Amphitheatre of the Infirmary. Dr. Eggston spoke on "Malignancies of the ear". Other speakers were Mr. Alan S. Feldman, Audiologist of the Winthrop Foundation, whose subject was "Hearing aids: Their indications and contraindications"; Dr. Jarrett H. Folley, a guest from Hanover, New Hampshire, who spoke on "The effects of atomic radiation on humans"; Dr. Otis F. Jillson, also of Hanover, whose subject was "Histoplasmosis of the larynx"; and Dr. Eugene G. Boss of Springfield, who presented a paper entitled "New tonsil instruments".

At a meeting of the American Ophthalmological Society, held May 28-30 at Hot Springs, Virginia, Dr. Parker Heath, Director of our Pathology Laboratory, gave a paper entitled "Essential atrophy of the iris: An histopathologic study". A paper on the subject "Ocular signs of Wernicke's disease" was delivered by Dr. David G. Cogan, Associate Surgeon in Ophthalmology. His co-author was Dr. Maurice Victor, an assistant neurologist at the Massachusetts General Hospital. Dr. Edwin B. Dunphy, Chief of Ophthalmology, presented a paper concerning the topic "The uptake of radioactive phosphorus by intraocular neoplasma".

In the Section on Ophthalmology of the American Medical Association meeting, held in New York on June 1-5, Dr. Cogan and Dr. Charles L. Schepens presented papers, while Dr. Dunphy and Dr. Heath led discussions on papers delivered by other members. Dr. Cogan's subject was "Ocular dysmetria: "Flutter-like oscillations of the eyes and opsoclonus", and Dr. Schepens spoke on "Clinical aspects of pathology in the vitreous body".

Dr. Philip E. Meltzer, Surgeon in Otolaryngology, presented a paper on "The technique of removal of adenoid tissue of the nasal pharynx in children" at the Ear, Nose and Throat Section of the A.M.A. meeting.

Dr. David D. Donaldson, Resident in Ophthalmology, had an exhibit of steriophotographs of diseases of the anterior segment of the eye at the May meeting of the Massachusetts Medical Society, held at the Statler Hotel.

Dr. George Kelemen has been appointed Pathologist to the Winthrop Foundation.

Dr. Herman J. Sternstein has been promoted from Assistant Surgeon to Associate Surgeon in Otolaryngology.

A pastel by Dr. Edgar M. Holmes, Surgeon for Plastic Operations, was reproduced in the May 14 issue of the *New England Medical Journal*. The picture is of sand dunes in the late afternoon and is called "Lengthening shadows". As a member of the Massachusetts Physicians Art Society, Dr. Holmes exhibited the same pastel last year at the Massachusetts Medical Society meeting.

Brief bits:—

Dr. Edward F. Bland was elected President of the New England Cardiovascular Society at its annual meeting on May 11. Two past presidents, Drs. Paul D. White and Howard B. Sprague, were elected to the Executive Committee.

Dr. Walter S. Burrage was a guest speaker on May 11 and 12 in a Continuation Course in Arthritis and Allergy at the University of Minnesota Center for Continuation Study. His topics were "Fundamentals of allergy" and "Cortisone in allergic disease".

Dr. Fletcher H. Colby was elected Vice-President of the American Association of Genito-Urinary Surgeons at the 64th annual meeting of the Association, held in Hot Springs, Virginia, May 6-8.

Dr. Bernard M. Jacobson delivered a lecture on May 20, at the annual meeting of the Massachusetts Medical Society. His subject was "Why the patient bleeds and what to do about it". Also, in the capacity of Consultant in Medicine, Dr. Jacobson went to the Veterans Administration Hospital in Togus, Maine, to make his annual visit. While there, he made rounds and delivered a lecture.

Dr. Varaztad H. Kazanjian has recently returned from New Orleans, where he read a paper on "The repair of partial losses of the scalp" at the annual meeting of the American Association of Plastic Surgeons.

Dr. Laurence L. Robbins was elected President of the New England Roentgen Ray Society at its recent annual meeting. Dr. Stanley M. Wyman was re-elected Secretary for a second term. Dr. Robbins had previously served two years as Secretary.

The annual Postgraduate Course in Electrocardiography, held under the direction of Dr. Conger Williams during the week of May 11-16, was attended by twenty-five members of the American College of Physicians.

⁂

New addresses:—

Dr. John S. Bray (clin. fel. *M.* 1953), 713 Chestnut St., Latrobe, Pa.

Dr. Charles H. Burnett (c.r.p. 1946), North Carolina Memorial Hospital, Chapel Hill, N. C.

Lt. Richard H. Eppright, MC, USAFR (a.r.s. *Or.*), 328 Fairchild St., Lackland Village, San Antonio, Tex.

Dr. Donald M. Glover (*W.S.* 1922), St. Luke's Hospital, 11311 Shaker Blvd., Cleveland 4, Ohio.

Dr. Arthur S. Keats (a.r.p. *An.* 1951), Mary Imogene Bassett Hospital, Cooperstown, N. Y.

Dr. Harold P. Klein (res. fel. *Biochem.* 1951), Dept. of Microbiology, School of Medicine, University of Washington, Seattle 5, Wash.

Dr. Louis W. Lewis (a.r.p. *An.* 1953), Veterans Administration Hospital, McKinney, Tex.

Dr. William R. Owen (*M.* 1950), National Heart Institute, National Institutes of Health, Bethesda 14, Md.

Dr. John H. Peters (*W.M.* 1943), U. S. Veterans Hospital, Atlanta, Ga.

Lt. Charles E. Rounds, DC, USNR (*Dn.* 1947), Hq. & Hq. Co., 115th Med. Bn., 40th Infantry Division, APO 6, c/o Postmaster, San Francisco, Calif.

Dr. Harley C. Shands (a. *Psychiat.* 1953), University of North Carolina, Chapel Hill, N. C.

Dr. Jacob Stovner (a.r.p. *An.* 1953), Fethlitzgt 1, Oslo, Norway.

Lt. Giles D. Toll, MC, USNR (*S.* 1952), Naval M CB 6, c/o Fleet Post Office, New York, N. Y.

VOLUNTEER GROUPS

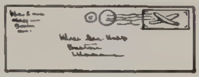
DISTAFF CLUB

At the May meeting of the Distaff Club, held in the Penthouse, the members continued their perusal of the countries of the world with a discussion on China, presented by Dr. Yang Wang of the MGH Medical Service.

Dr. Wang gave a very interesting and complete description of this vast and important country in the Far East. Beginning with the earliest known date of its existence, about 2500 B.C., Dr. Wang took us through the centuries of its development, up to the present-day culture. He correlated these historical facts with events in other major empires of the world, thus including China as a leading nation in the world progress. Also presented were references to the Chinese family life, its language, and religions. Dr. Wang pointed out that the cohesive family unit is responsible for the continued strength of the Chinese through the ages.

Each member of the club was grateful for the valuable knowledge gained and is eager to learn more about China and other countries of the Far East.

Hostess for the evening was Mrs. Richard N. Kleaveland. Refreshments were served following the discussion.



Our appeals to MGH "singletons" in various parts of the world continue to bear fruit. This absorbing letter has arrived from Dr. William D. Shorey (*E.S.* 1946) written from the American University of Beirut in Lebanon.

I was very pleased to get your letter asking me to write about my experiences and impressions here in the Middle East. I could not decide quite what to write until Dr. Waddell came here for the Symposium in the middle of April and began asking questions. The following is a summary of several nights' conversations.

First of all, Beirut is a modern city on the shore of the Mediterranean, running up to the foothills of the Lebanon Mountains. Its population is approximately half a million. The mountains rise to an elevation of some 10,000 feet within 20 miles of the shore, making one of the most attractive settings for any city one can imagine. Beirut is the entry-port for travelers for the entire Middle East. As such, it is extremely cosmopolitan and modern. Almost everyone lives in an apartment which is equipped with wide balconies — very necessary because of the heat in the summertime.

The life here is extremely pleasant in many ways. Service is cheap and easy to come by, and the living and social conditions are quite good. Many of the conveniences we knew at home are not found here, but one does not miss them. It is possible to ski within an hour of Beirut from the middle of December until the middle of March. In the high mountains snow lasts till the first of June. When not skiing, the Mediterranean is at hand for swimming. The countryside is very beautiful, and there are excellent roads to places of historic and natural beauty. The climate is warm but healthful. There is a large American community of about 3,000 people who seem to enjoy themselves very much here.

Beirut is not typical of the Middle East, however, which is much more undeveloped and is primarily agricultural. The financial lines are more strictly drawn and while there are many very rich Lebanese, there is practically no middle class and the greater majority of the people are extremely poor. On top of that, there are in Lebanon some 150,000 refugees from Palestine who are being supported by the UNRWA. Because of this large poor group, the supply of teaching cases is practically unlimited and permits the selection of the most interesting cases for admission for teaching.

The Medical School course consists of 5 years, the last year of which is essentially a rotating internship on a junior level. The classes start off with about 40 students and graduate between 25 and 30. The Medical School is only a small part of the University, which has a total enrollment of about 3,000. There is a great desire for further education in hospitals and postgraduate schools in Britain and the United States. We send each year about 1/3 of the graduating class to the U. S. for their internships and take about 1/3 of the class here. In addition, 3 or 4 of our teaching staff are usually in the U. S. every year, taking advanced courses. The staff is small and in general is overworked. The patients cannot afford to stay in the hospital, so our major cases usually go home in 7 to 8 days and the minor cases in 3 to 4, resulting in a very high turnover of cases. On the surgical service we do between 40 and 50 operations a week, with some 50 beds.

Due to the fact that until recently there have been no roads or transportation facilities, the villagers in the mountains and on the Syrian plains have tended to inbreed to a considerable extent. This has resulted in a large number of congenital abnormalities, which have been most interesting to handle. Meningomyeloceles and meningoencephaloceles are almost always represented in the hospital, and other congenital abnormalities are frequently seen. I have just operated on two cases of diastematomyelia which will make the 43d and 44th reported in the literature. Other surgical problems which are common are those related to parasites endemic in the area. Primary among these are hydatid disease of the abdomen and chest.

In addition to running the surgical service, I have also had the opportunity to design a 70-bed central unit of our future hospital of 400 beds, containing the operating rooms, etc. This has been most interesting. The building will be ready for occupancy this summer.

In April we held a Medical Symposium here, at which representatives of all the Middle East from Athens to Cairo to Karachi were present. To this we brought some 28 speakers from England and America, and were fortunate enough to persuade Dr. Waddell to come and tell us about the development of I.V. fats. This Symposium was the third in the series which we started for the practising physicians of the Middle East, to bring to their attention some of the recent advances in Western medicine. It was most enthusiastically received, and we had over 700 physicians attending. These physicians have done a great deal in this area to bring medicine up to date, for so many of its practices were essentially medieval. There is a great deal left to be done, however, and the opportunities for research and teaching are practically unlimited. Problems to be studied are more numerous than can be handled in the time available.

Since one of our reasons for coming here was to travel, we have been around in the Middle East a good deal. We drove from here to Istanbul through Turkey and found it one of the most stimulating of countries. Turkey is trying to pull itself into the 20th century as rapidly as possible. There is an intense nationalism, and the Turks have a great deal to be proud of in what they have accomplished. While we were in Istanbul the first boat-load of returning veterans from Korea arrived and were met by practically the entire city in a most tremendous demonstration. All of the returning Turkish soldiers have been greatly impressed by our troops in Korea and were marvelous ambassadors of good will for the U. S. in Turkey. This is in happy contrast to most other Arab countries, where reaction to Americans is far from favorable. All of us here are endeavoring to improve these conditions, which have deteriorated so much in the recent years.

We were in Iran when the British were being evacuated from Abadan and before Mossadegh became as violently anti-American as he now is. Great masses of the people were apathetic at that time, but recent events have caused them to treat Americans, as well as the British, with some cruelty. We were fortunate to travel through the entire central and southern portions of Iran before that time, and we saw the tremendous ruins left behind by the kings of the Meads and the Persians. Persepolis, their capital, is now a most impressive ruin, perched on the side of a mountain overlooking a bare and desolate countryside.

Last year we spent a month in Florence and the surrounding areas which George Nardi used to tell us so much about. We found it to be even more interesting than he had described.

Our future plans are as yet indefinite, but we shall leave here this September and probably return to the States at that time. I shall be very sorry to leave Beirut, as I have enjoyed my work here very much. However, I know that the Surgical Service will be in good hands when John Wilson arrives this August to take over. I shall be looking forward to seeing everyone at the General again this fall.

Another letter from one of our "singletons"—this one from Dr. Hastings Mewburn (*Or.* 1923), from Edmonton, Alberta, Canada. Everyone who lives in or has visited Canada will find this letter particularly engaging.

Probably the first thing I should do, in writing you from Edmonton, is to give you a simple method of finding its geographical location. If you will find Salt Lake City on a map and follow its meridian northward until you are 400 miles north of the International Boundary you will be at a spot a few miles west of Edmonton. It was first established in 1795 as a trading post for the Hudson's Bay Company, and was named after the borough of Edmonton in North London, England. It is a city of some 185,000, situated on both banks of the North Saskatchewan River and is known as the fastest growing city in Canada. It is about 250 miles east of the Continental Divide and, of course, is so far away from it that one cannot see the blue silhouette of the Rockies on the western horizon as one can in Calgary. The surrounding country is gently rolling prairie, covered with scattered clumps of bush and trees of various sizes. The trees are mostly poplar or willow, with evergreens interspersed in varying proportions. It is essentially a farming community, though in the past six years agriculture has been given quite a race for first place by the petroleum industry. However, in the past year the value of the agricultural products was four times that of the petroleum industry. In this latitude we have a great seasonal variation in the amount of daylight and dark. In the short days in December the workmen go to their jobs by electric light and come home using the same artificial light. In the summer time the opposite takes place, and in June the sun never seems to set at all. We do not have to legislate for daylight saving because Mother Nature has already seen to that.

My service at the M.G.H. terminated at the end of June 1923 and I immediately returned to Edmonton to get established in practice. Orthopaedic surgery in Edmonton was in its infancy. It would be more correct to say that it had not been born because, at that time, nobody was limiting his practice to that branch of surgery. In Calgary, some 200 miles to the south of us, one man was trying to make a go of it as an orthopaedic surgeon, but it was awfully hard work. In fact, the only specialty recognized at that time was eye, ear, nose and throat. In such a situation, the orthopaedic equipment in the Edmonton hospitals amounted to nothing. There were no fracture or plaster tables and, to apply a hip spica, an overturned basin or bowl on the operating table did duty as a pelvic rest. I mention spica tables particularly, because the first one used in the University Hospital was made by the Hospital carpenter and a blacksmith from the University of Alberta. It was a replica of the plaster table we had in the basement of old Ward I. A few nights before I left the M.G.H. I went down to that basement and made a working drawing of it. I may say that our table is still doing duty in one of the plaster rooms in the University Hospital. There are several copies of this table in some of our municipal hospitals round the Province that have duplicated the design. In 1923 money was rather short, and most of the original equipment was built locally by the artisans of the University Hospital and the University staffs. When we had our bit of apparatus finished, the other city hospitals sent their carpenters and engineers over to copy our equipment and in this way everybody gradually acquired some orthopaedic equipment. It was well made, did excellent work, and, above all else, was not expensive.

Another bit of interesting work was being carried out during the summer of 1923. That was the organization of clinical teaching in the Medical Faculty of the University, so that the whole course in medicine could be given in Edmonton. When the Province of Alberta was formed in 1905, arrangements were made to start the Provincial University. Teaching in the Faculty of Arts and Sciences started early, but it took a little more time to get medicine under way. A start was made in the preclinical subjects and, in 1914, the faculty was almost ready to give the full course. However, World War I broke out in August of that year, and with so many of the staff, undergraduates, and prospective students on active military service, this project had to be abandoned for the time being. The preclinical subjects were taught, as before, and the students went to Toronto or McGill for their clinical work and degrees. In the postwar reorganization, the time appeared ripe to start the clinical teaching when the session opened in the fall of 1923. The class of 1925 was the first to take the full course at Alberta, and two years later they graduated with eleven members.

As I was the only one in Edmonton who had had any recent training in orthopaedic surgery and the only one limiting his practice to that particular specialty, I was put in charge of the department, with the rank of lecturer. The plan of teaching orthopaedic surgery was very much the same as that used by Harvard Medical School and associated hospitals in Boston. In 1927 the heads of neurosurgery, urology, and orthopaedic surgery were given the rank of assistant professor. In that way my University status was described as Assistant Professor of Orthopaedics. Four years later, in 1931, we were all advanced to be clinical professors and I became the Clinical Professor of Orthopaedic Surgery in the Faculty of Medicine and Senior Orthopaedic Surgeon to the University Hospital. In 1948, after having been head of the department for twenty-five years and having reached the age of three score years, the retiring age for part-time staff, I resigned from the teaching and administrative duties and became Honorary Clinical Professor of Orthopaedic Surgery. At the present time I am still practising orthopaedic surgery and am a member of the orthopaedic staff of the University Hospital.

There has always been the closest cooperation between the Veterans Administration and the University Hospital. This Department of the Dominion Government was formed at the end of World War I to look after and give the necessary medical and surgical treatment to the returned military men. In that period of time it has had many different names, and at the present time is known as the Department of Veterans Affairs, or D.V.A. for short. Prior to 1923 the D.V.A. operated its own hospital and, as this institution was to be taken over by the University as the University Hospital, an agreement was entered into by which all hospitalization of the veteran, in the Edmonton District, would be carried out by the University Hospital. All members of the Hospital staff doing D.V.A. work have appointments to the Department and all medical officers have appointments to the Hospital staff. In this way the staff has the proper authority to handle these patients and the proper responsibility in the chain of Hospital administration is maintained. This arrangement has worked exceedingly well in Edmonton ever since it went into effect thirty years ago.

As far as possible, the men have always been grouped together in special wards or wings of the Hospital. The veterans prefer being together and it makes for easier administration, as the D.V.A. patients are hospitalized in a somewhat different manner from that of the ordinary civilian patient. The men are used as clinical material for teaching and as subjects on final clinical examinations. It is no uncommon sight, during examination times, to see the students going back to the ward to find out how they have done on the examination. Often the information is surprisingly accurate, as many of the veterans have been examination subjects a number of times. Thus it was in the summer of 1923 that I rejoined the D.V.A. as a part-time orthopaedic surgeon. I say rejoined, because my first civilian job was with the Department on demobilization in 1919.

In the fall of 1927 a severe outbreak of poliomyelitis occurred in the Province and the existing hospitals were in danger of being swamped by these convalescent patients who needed physiotherapy and rehabilitation. The Provincial Government was approached for aid in handling the situation. The upshot was that the Department of Health built a temporary 60-bed hospital to care for these convalescent patients. It was built close to and eventually connected with the University Hospital and was opened for the reception of patients in January 1928. As the aftertreatment of polio is orthopaedic in character, the administration and treatment were turned over to the Department of Orthopaedic Surgery. As a result, I became a part-time employee of the Provincial Government and a hospital superintendent as well. Two years later the administration of this convalescent unit was taken over by the University Hospital. In the early days of this scheme, the patient was supposed to contribute what he could to the cost of his treatment. Very little was actually collected. In 1938 the Provincial Government brought in a new Act and announced that they would be responsible for all costs of the aftercare of poliomyelitis. The patient is responsible for his hospital and medical care during the quarantine period and for his transportation to and from the hospital or clinic.

The next outstanding event that comes to mind was in the fall of 1942, when there was a tremendous influx of American civilians, soldiers, and machinery to take part in the building of the Alaska Highway. This was known to the natives of Edmonton as the "American Invasion", and it lasted till the end of the war. I don't know how many troops and civilians were involved, but there were a lot. Just before the war Edmonton had put on a spurt of growth and was fairly "busting out all over". That alone made living accommodations and office space hard to find, and when the "invasion" came along it seemed doubtful if all could be accommodated. It took considerable adjusting, but things gradually settled down and everyone really got along very well. As American construction progressed, the situation became much easier. During this period there were lots of uniforms on the streets of Edmonton, but with the "invasion" present the majority were American.

Until the American Medical Corps got established, the hospitalization of all U. S. service personnel was carried out at the University Hospital under the supervision of the D.V.A. Irrespective of what army it is, Medical Corps seem to operate by the same set of unwritten rules. It is interesting to note that the first two American medical officers to look after the U. S. troops were two pediatricians from Texas. However, it wasn't so very long before a U. S. Army hospital was built and equipped and staffed. This eased a great load on the University Hospital. Weekly staff rounds were held, alternating between the U. S. Station Hospital and the University Hospital. These resembled very closely the various hospital visits held in Boston. A very active medical society was formed, called the United Services Medical Society, and the membership was drawn from the armed forces of the United States and Canada and members of the Department of Veterans Affairs. Monthly meetings were held in turn at the U. S. Station Hospital, the Royal Canadian Air Force Hospital, and the University Hospital. The fourth meeting was always a dinner meeting at the MacDonald Hotel, and then the rotation was carried out as before. Many interesting meetings were held and many firm friendships made. At this time the medical faculty began to be very short-staffed and, as the staff of the U. S. Station Hospital was not overworked, a number of medical officers received temporary teaching appointments to the Faculty of Medicine. On one particular occasion we had a very excellent example of "lend lease", cooperation, or whatever you might call it. The University Hospital was notified that a convoy of 150 Canadian battle casualties would arrive in Edmonton in the wee small hours. At that particular moment there was just one empty bed in the University Hospital. However, as the U. S. Station Hospital had more than enough empty beds to handle the situation, it was a very simple matter to have the ambulances take the patients there.

Since the end of World War II the most interesting event has been the development of the Alberta oil field. The search for oil developed seriously in 1914 and was carried on sporadically all over the Province. It was interrupted by two wars and held up frequently for lack of funds. However, in 1947 a really good producer was brought in about twenty miles to the southwest of Edmonton. This is the famous Leduc field. The bringing in of one or two active wells soon after proved the field. This stimulated activity in no uncertain way and in no time oil men, oil companies, and oil rigs appeared in countless numbers. Needless to say, a large proportion of these men came from oil areas in the Southwestern States, and though American car licenses were quite common before, they are numerous now. Oil wells are being brought in continuously and the field seems to be getting larger. In April of this year, the Provincial Government announced that there were now 3,800 oil wells in production. Refineries have been built, industries are locating here on account of the oil and natural gas, and a pipe line has been completed to Superior, Wisconsin, and another one is being built to the Pacific Coast.

I suppose this is the time to present some figures to substantiate my statements and to give you some idea of the size of the panorama. There are now 7 orthopods in Edmonton. The community has grown from a city of some 60,000 in 1923 to one of 185,000 in 1952. Since 1923 the University has been giving the complete course in medicine here in Edmonton. It is a Grade A medical school, with an undergraduate strength of about 250 men and women. It is a 4-year course, with the entrance class limited to 65. The first class to take the complete course at Alberta graduated in 1925, with 11 members, and at the present time the graduating classes average about 60 men and

DR. ROBERT R. LINTON, VISITING SURGEON—PERFORMING AN OPERATION IN PROFESSOR DENK'S CLINIC IN VIENNA
Left to right: DR. WOLFGANG DENK, DR. LINTON, DR. OSKAR STEINHARDT

women. There are approximately 1,000 graduates, and they may be found in the four corners of the globe. It is a recognized centre for postgraduate training in both the United States and Canada. In Edmonton there are 4 large standardized general hospitals, with a combined bed capacity of 1,900 to 2,000. The University Hospital is the largest of these, with about 900 beds, of which the D.V.A. has a priority on 265. During this 30-year period we have successfully weathered World War II and are now going through further development, including a first-class oil boom.

Before bringing this letter to a close, I should like to say that I am very proud to have been a house officer at the M.G.H. I enjoyed the service, the surroundings, the people with whom I worked, and particularly the way the work was carried out. Many firm friendships were made in all parts of the United States. The one regret is that on account of distances, local activities, and possibly a touch of old age, one does not return very frequently and tends to get out of touch with things at the M.G.H.

I have read this effort over several times and am not so sure it fills the bill. At times it seems more like a brochure of the Board of Trade of some young and enthusiastic western town, trying to be put on the map. If it does not come up to scratch, do not hesitate to use the wastebasket, which I know every editor has in close proximity to his desk.

Dr. Milford D. Schulz (r.) has sent us this interesting letter from Sweden:

On the first of February, the Schulz family (including Mary Catherine aged six, two teddy bears, and five dolls of assorted sizes) landed in Göteborg, Sweden, from the steamship *Gripsholm*. The twelve-day crossing was millpond-smooth, but on its return trip to New York I understand the *Gripsholm* was pretty badly buffeted by the now-famous Atlantic storm of early February. Recently we had dinner with the ship's doctor, who told us about the return voyage through the storm. Apparently it was a really exciting one — unsuccessful attempted rescue at sea and everything. Fortunately, that we missed.

Our first week in Sweden was spent in Göteborg with Dr. Strandqvist and Dr. Leisner at the Radiotherapeutic Center. Dr. Leisner, by the way, spent the month of March visiting at M.G.H. We then came to Stockholm where, unexpectedly, we were met at the train by Bob Loftfield of the Huntington Laboratories. The next day we found Jack and Ruth Graham, who had been at the Radiumhemmet for some months and who returned to the M.G.H. in March. Since reaching Stockholm I have spent my time at the Radiumhemmet observing the way malignant disease in general, and more particularly malignancy of the uterine cervix, is managed in Sweden, especially by radiotherapy.

As an interlude in the Stockholm program, the month of April was spent visiting the principal radiotherapeutic centers in England. On our way we stopped at Lund and Upsala which lie to the north of Stockholm and are the two principal university towns in Sweden. Their schools were founded about the time America was discovered. In Malmö, which is just a few miles from Lund and across the strait from Copenhagen, we saw Bengt Skanse and spent a pleasant afternoon with him and his wife. They wished to be remembered to their good friends at the M.G.H. (Skanse worked with Dr. Means in the Thyroid Laboratories five years ago.)

Our first stop in England was London. Unfortunately, our arrival coincided with the beginning of a bank holiday. This meant that from Thursday till Tuesday everything was closed tight. London — and all of England, for that matter — was in quite a bustle and turmoil getting ready for the coronation, but the crowds had not yet arrived while we were there. In London and in Cambridge we met Mr. and Mrs. Raymond Quick, who had just returned to England in order to secure re-entry visas into the United States under the immigration quota. Raymond Quick will be remembered as fellow in the X-ray Department during the year 1951. In London and in Manchester we also met John and Barbara Reeves and had a good time reviewing old MGH affairs. John finished his residency in Radiology at M.G.H. in 1951.

On our return trip to Stockholm we stopped for a few days in Oslo to visit the Norwegian Radium Hospital. This is the principal center for the management of malignant diseases in Norway.

Next week our stay in Stockholm comes to an end, and we move on to Copenhagen where I shall be at the Radium Center till we return to Boston and the M.G.H. The International Congress of Radiology has its quadrennial session in Copenhagen this year, and I plan to attend the meetings. A number of Boston radiologists, including Dr. Robbins, will also be there.

It might be interesting to mention something about the radiotherapy institutions on this side of the water. In all Scandinavia, radiotherapy is carried out exclusively in special centers. These centers practically amount to the cancer centers for each country. There are three in Sweden — one in Göteborg, one in Lund, and the largest and principal one here in Stockholm. This Radiumhemmet is really a very remarkable place. It is part of the Caroline Hospital, which is the teaching hospital for the Caroline Institute — the medical research Institute.

In Norway there is one center — the Norwegian Radium Hospital in Oslo. In Denmark there are three principal centers. The largest of these is in Copenhagen; it grew up in association with the famous Finsen Institute. Each of these centers is a complete hospital in itself, quite separate from the general hospital, but is almost always associated with a large medical center. This arrangement is peculiar to Scandinavia.

In England there are a few radiotherapy centers separate and distinct from the general hospitals — the Hold Radium Institute in Manchester, for example. More often the radiotherapy unit, though separate and distinct as a department, is associated with and a part of a large general or teaching hospital. This is the case in the Royal Cancer Hospital in London, which deals with the treatment of malignant disease in all its phases. This is quite different from what is generally done in the United States, and it has been most interesting to observe these differences in organization. Apart from the organization aspects, however, the actual manner in which people who are sick with cancer are cared for — at least, in those places I have visited — is pretty much the same as at home.

These have been wonderful and instructive months that we have spent in Europe, but we are all counting the days until we can get back to Belmont, Boston, and the M.G.H.

It was very gratifying to find that Dr. Walter Pick (r.p. *C.M.* 1947) had not forgotten us entirely. This nice letter from him arrived recently:

It has been over five years since I started the practice of pediatrics here in Fitchburg, Massachusetts, and also since I last wrote to your delightful publication.

The practice here is very stimulating. Fitchburg is only forty-nine miles from Boston. This makes it easy to attend medical meetings there and to keep up to date. The local hospital has a fine staff of physicians with almost every specialty represented, including pathology and anesthesiology. The only specialties which are not represented in town are dermatology and neuropsychiatry. If a resident in either of these two specialties would consider practising here, I am sure he would be busy in no time and would get the encouragement of a fine group of fellow physicians. By the way, another pediatrician would do well here, too.

George Walker, assistant resident in surgery at the M.G.H. in 1951, is one of the surgeons here. The Medical Service is run by James G. Simmons, HMS 1923, and the Surgical Service is run by Frederick Ross, HMS 1939.

This short note, attached to his subscription card, has come from Dr. Marc Anthony (*Oph.* 1929) of Spokane, Washington.

I fly to Boston every two years now, using as an excuse either a class reunion or the graduation of my sons from Harvard.

This very cordial note arrived not long ago from Dr. Kenneth P. Nash (a.r.p. *Psychiat.* 1949).

Every issue of THE NEWS brightens the flame of friendliness and academic interest and enthusiasm gained at M.G.H. We enjoy it thoroughly.

We appreciate the good intentions evinced by Clayton H. Hale (sr. r.p. *R.* 1943), even though lack of time at the moment of writing made a longer letter impossible. He penned this message at the foot of our subscription expiration notice:

I still read THE NEWS with great interest. Keep up the good work.

I have no real news except to report that I am very happy in Syracuse. Mrs. Hale and I took the four children on a cruise to South America this winter, which was most enjoyable as well as a good rest. Not even one kid fell overboard.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 126 Boston, Mass. September 1953

A CONCEPT OF COMPLETE OBSTETRICAL CARE

When Miss Holbrook asked me if I had something I would like to say in THE NEWS, I said "Yes" with an alacrity that may have startled her, for I had recently been thinking at some length of the problems and extent of maternal care, and out of it all had come a conviction that a broad view and a concept of a lifelong service to the woman and her husband and her child is necessary to the proper alignment of any one phase of maternal care. This concept I developed in a paper given at the annual meeting of the American Association of Nurse-Midwives at the Frontier Nursing Service, Wendover, Kentucky, in October 1952. Although it is directed toward the work of the nurse-midwife, I believe the discussion has enough of general interest, perhaps, to warrant space in THE NEWS and so I present it here:

I have chosen as a title "A concept of complete obstetrical care". I shall present to you nothing new; in fact, I was careful to say "A concept", not "The concept" or even "A new concept of complete obstetrical care". But with brash courage in facing a group already well informed on the subject and already doing something about it, I shall presume to collect some unoriginal ideas and to develop in a short space of time an obvious thesis. This is not always an unprofitable pursuit, and possibly therein may lie any small distinction this paper has.

A concept of the problems of maternal health is not new. In some form, however simple, some sense of the need of the pregnant mother for outside assistance must have existed from earliest time. Protection of the female against the hazards of reproduction is a basic law of life as natural as reproduction itself. In actual fact, it is not at all even a human prerogative, but a fundamental attitude of nature, instinctive throughout the animal kingdom. No matter how willingly a mother risks her health and her life for her unborn child, for her to die in childbirth is perhaps life's greatest paradox and its greatest tragedy. So the woman who first "stood by" the parturient mother long before history's record was, in the truest sense, the first obstetrician. I have said "woman" advisedly, for I am sure that the pattern you have seen here in these mountains is inherent and must have come down from the deep roots of the past to be as instinctive as it is. There must have been some Piltdown or Neanderthal granny woman. A concept, therefore, of the necessity for providing care for the pregnant mother is not new. It is quite possible, too, that these early mothers, assisted by their midwives, experienced all the thrills of "natural childbirth" as they heard their babies' first cries! Hence, even in the broadest sense, I am discussing nothing new. But the full appreciation of what the hazards to the pregnant woman are, how they operate, what preventive measures can be taken have come only slowly. Much less clearly has there evolved either a concept of the individual emotional and social problems involved in pregnancy care or of methods of meeting them. Today I propose for your consideration what I wish to believe is the present-day evolution of the dim, inarticulate groping of the first midwife so long ago—that pregnancy is not an isolated incident in the woman's life to be cared for at the moment, but that training her as a mother and protecting her through her reproductive life span is a lifetime work.

Out of this attitude has come this modern threefold concept of maternal health:

1. That maternal health care starts with the baby girl at birth, watches her through her preadolescent growth, prepares her for puberty, carries her through the development of her reproductive stature, trains her for her pregnancies, conducts them safely, checks her between babies, and leads her through the trials of the menopause to a happy and comfortable old age.
2. That specific but varying hazards—physical, emotional, economic — exist at all stages of this cycle.
3. That these varying problems must be met by varying means at each stage.

The practical application of this concept of total maternal care can be reduced rather simply to a careful analysis of the problems to be met at each period of pregnancy and to the development of techniques for resolving them; to find, in short, at each phase of pregnancy what can be done, what should be done, and how best to do it.

The obstetrician rarely sees his prospective patient in her preadolescent years. Here, however, the doctor in the smaller community, seeing the family as a unit, has a distinct advantage. It is possible for him to see his patient grow up. Thus he can correct nutritional deficiencies; can do his part in preventing debilitating diseases such as tuberculosis, rheumatic fever, nephritis; and perhaps most important of all, he can help to provide, through her parents, the proper emotional, social, and economic environment for her advancing development.

With the onset of puberty, physical growth and development bring all of the problems of menstruation and sexual maturity. The emotional problems that accompany this physical change may be severe, for the young girl must now psychologically realign herself to a new position in her family and the community. What she learns and does at this point in her life condition her whole approach to her own part in marriage, family, and community. Perhaps at no other time in her reproductive life is there more need for proper preparation, counseling, and training to establish proper attitudes toward her sexual and social development, and to protect her from physical disease and moral trauma. This support must be the straightforward, authoritative, factual teaching that can come only from the combination of parents, the nurse, and the doctor. Needless to say, this training must antedate and coincide with her physical development.

As the adolescent girl grows and marries, she approaches the preconceptional period. It is in this phase that she falls into one of four distinct groups:

1. The normal. Here, reassurance is the treatment.
2. Those in whom pregnancy becomes a suicidal risk. Here, the facts must be tactfully, gently, but plainly presented and all possible help given in changing the young woman's focus toward other proper substitute activities.
3. Those in whom pregnancy is temporarily contraindicated because of untreated or uncontrolled disease, such as active tuberculosis, uncontrolled diabetes, acute rheumatic fever. Here the obvious therapy is to the complicating disease, with postponement of pregnancy until after its elimination.
4. A very small group in which a very few serious deficiency diseases occur. Here, again, the situation must be carefully explained to the woman and efforts made to help her into other channels. The doctor, quite naturally, is the only one qualified to be of service.

In the actual prenatal period for the first time, maternal care comes to an acute focus. At this time certain clear-cut steps must be taken:

1. The mother must have a thorough check of past illness and health, with particular reference to her ability to bear children.
2. She must have a thorough physical examination, both general and pelvic, and with mensuration of her pelvis. This must include weight, blood pressure, hemoglobin, blood grouping and Rh,

urinary check for albumin and sugar, Wassermann, and preferably a chest x-ray.

3. Her nutritional status must be evaluated.

4. She must be seen at sufficiently frequent intervals to be sure that no complications arise. At each visit her urine should be checked for albumin and sugar, her blood pressure and weight checked. She should be quizzed for any symptoms of complications. The development of the fetus should be watched. Her eating habits should be checked.

5. She should be given information throughout her pregnancy as to the development of her baby, the changes taking place in her own body. General and specific hygiene and nutrition teaching must be given. Cognizance must be taken of the emotional, social, and economic factors which may have direct or indirect bearing on her health in her pregnancy. In short, she, along with her husband and family, should be coached and prepared for the climax of delivery and the return home with the new baby.

Undoubtedly the most immediately dangerous time to the mother's health and life is the period of labor and delivery. Although all of her past condition and preparation will have much to do with her ability to withstand the trauma of delivery, her safety and the baby's lie for the most part in the hands of the doctor, nurse, or midwife who delivers her. Thus, there is no substitute at this time for:

1. Properly trained personnel.

2. Adequate facilities, especially for dealing with complications.

The postpartum period is one of readjustment, care being directed to:

1. Aiding in the normal processes of involution, and checking by proper physical examination to be sure they have taken place.

2. Providing full protection against infection to which the mother is particularly susceptible at this time.

3. Enhancing a normal relationship to the baby in feeding, physical care, and emotional response.

4. Protecting the mother's physical and emotional health against the dangers and difficulties of an altered family and community environment.

One of the most neglected phases of the care of the mother's health is the pregnancy interim period. At no other time can previously discovered abnormalities be so readily and leisurely treated in expectation of a better pregnancy in the future. These corrections apply just as well to deficiencies of family relationships and social and economic conditions.

Finally, maternal health care can in no way be considered complete unless steps are taken to mitigate the dangers and discomforts of the menopause and advancing years. Many of these, in fact, stem directly from experiences of childbirth. Nor should those interested in training each succeeding generation overlook the influence of the older upon the younger.

Here, then, is the outline. How can this be put into effect? There are two great fallacies, I believe, that in the past have hampered the full and proper growth of maternal care services. As I have pointed out thus far, the problems are different at each phase of pregnancy. Too common an error in the past has been a neglect of this point, so that one phase of the service was developed out of proportion to others. Thus, at the beginning of prenatal care in this country it was assumed that in a complete and early examination of all pregnant women, followed by continuing observation throughout their pregnancies, all problems of childbirth could be anticipated, all dangers met, and maternal morbidity and mortality thereby reduced to the irreducible minimum. This, sadly, was not so to be, and we have found it out. We now realize full well that a sound prenatal service can be defeated by bungling accouchement, and, equally, good delivery care will come to naught if inept postpartum nursing leads to infection. The second fallacy is equally destructive to a progressive over-all maternal health service, and that is the feeling that one type of organization can be made to cover within its own setup all regions and all types of communities. This, I am sure, is an oversimplification of the problems and a turn to the American tendency to pigeonhole in the smallest number of pigeonholes. In a country as broad as ours this cannot be done. And since in other countries the organization of medical services has progressed usually from mental care to State treatment of the tuberculosis patient to maternity benefits, both financial and through actual service, it behooves us in this country to observe other areas carefully and not be misled by inapplicable patterns. Therefore, in the light of our mistakes in the past and of a concept of complete obstetrical care for the future, let us examine the possible variations of organizations for such a service.

In general it is clear that there are several basic elements:

1. The Obstetrician. This term I use in the broadest sense. Perhaps a better word would be accoucheur, for I mean the specialist, the general practitioner, the nurse-midwife, the untrained midwife—whoever stands in control of the care of the pregnant mother. Someone must be in charge.

2. The Nurse. The service of the nurse lies in two categories. She is the doctor's assistant in all that he may direct her to do in the actual care of the mother, in helping him in the office or the clinic, and assisting in the delivery room, on the wards, and in the home. The second field of service is an extension of the first, in what might be termed the public health approach. More and more it is clear that what actually counts is the way in which the pregnant mother applies to her own daily living the principles she is taught. This we have too often assumed, and it has been a revelation to learn from a home nursing visit what lack and what misapplications of training have existed in actual fact. The public health nurse is the only one who can serve in this way.

3. The Nutritionist. It has become obvious through many studies that the mother's nutritional state both before and after pregnancy is one of the major factors in the maintenance of her health and that of her child. It is, however, a highly specialized subject and in many cases needs expert guidance.

4. The Social Worker. No one who has long dealt with pregnant women can be unmindful of the great prominence of social, economic, and community factors which play upon the emotions and health of the mother and the whole family. One must be equally mindful of the fact that special training here is indispensable, and so the social worker in her field becomes another link between the doctor and the proper application of his directives.

5. The Psychologist. I have avoided the term psychiatrist, for I am afraid of the connotation of a pathological state. But there is a need for someone with special training or ability in dealing with the more purely emotional and psychological problems of pregnancy.

6. The Health Educator. One of the recent advances in medical technique has been the development of methods of health teaching, and this has not been a problem simply solved. But there are methods brought out by this specialist which have been applied with great profit to the peculiar difficulties of teaching maternal hygiene.

7. The Pediatrician. This specialist has been added to the team to permit him to observe the prospective mother at intervals throughout her prenatal course. He then comes to know the mother of the child whose care he will later take over. He is forewarned of problems; he can help in meeting them before they become serious. Even more, the mother herself can turn to him for the answers to her early questions of baby care. Her confidence in the man who is to care for her baby is established and one more of the sudden shocks of childbirth is softened.

I have purposely personalized these different elements for emphasis. I have no thought that all seven must be represented in each organization by seven individuals, nor is it at all desirable in every case that they should be. But it must be clear that whether the responsibility for maternal care lies in one individual or in a clinic, these are the elements that must be covered if we are to give the kind of service we propose.

To be more specific, these principles may be profitably applied in one or more of the following ways, singly or in combination:

1. The Specialist. This man is trained to be the leader in his field, and as such his patients have a right to demand the

best of care. When he assumes this responsibility upon his own shoulders he must be sure he discharges it well and completely. His purely technical care should never be in question, but he must be sure that he does not neglect the other phases outlined above. He must develop within his patients the confidence that leads to a willingness on their part to bring to him all problems, and he must then treat them all with the seriousness with which they were presented. He must have resources with which to meet them. He must know all of the community organizations which can offer help. He must be able to give nutritional advice. He must teach hygiene—whether to groups of his patients with their husbands or individually—and he must know that his instructions are being followed. Of course, he has the assistance of his nurse, his secretary (a worker of no small responsibility), books and pamphlets, and the community organizations—but his is the responsibility. And above and beyond this, this man, this specialist, has the duty of leading his profession forward into the future.

2. The General Practitioner. This man delivers most of the babies of the country. His is a great field—perhaps the most difficult position to fill and fill well. Yet he must do it if he accepts the care of pregnancy. He must be all that the specialist is to the degree of his time and ability. Herein lies the distinction of the good, safe local doctor. He knows his limitations and he knows where he can receive the help he needs—and he is willing to use it.

3. The Nurse-Midwife. This woman, highly trained in her special field, may assume total responsibility for maternal health care and must discharge it as fully as I have described above. If she is working alone, as she must do in some areas, she has a big job. If she works as she should, in such an organization as the Frontier Nursing Service, she is able to bring practically and economically to large areas of this country and the world a type of care that would be impossible in any other way.

4. The Untrained Midwife. I mention her because I believe that for some time she will still form an important link in our world-wide programs. She must have meticulous supervision, but under such watchfulness she can do a good job. Obviously, the supervision can best be done by the nurse-midwife who is herself working under the over-all supervision of the doctor. This is a method exceedingly economical, of both personnel and finances.

5. A combination of the doctor and the public health nurse or the nurse-midwife. It must be seen that there are all possible combinations of this type of service. It is a method that admits of almost infinite tailoring to the individual situation, being of special value in rural areas in combining private and State services.

6. The Clinic. This I mean as the large clinic run in connection with a delivery service in a hospital. If this is a teaching center, the organization is extensive and offers in many individual persons the elements I have listed. Herein, however, lies one of its great disadvantages. The personal touch is lost. The mother becomes a patient with a unit number, who "runs through" the service in a sort of production-line fashion. Undoubtedly it has contributed greatly to the advance of maternal care, and is to a great degree responsible for the reduction in both maternal mortality and morbidity; but, as I see it, one of the real unsolved problems of the future is the reintroduction of personality—the personality of the mother, her husband, and her child—the family personality—into the clinic.

7. The State. The State must function throughout our maternal care programs in a variety of ways. There will be areas, perhaps even whole countries, in which the State must take complete charge. Reasons for this are beyond the discussion today, but the possibility must be recognized. If the State assumes complete responsibility it must offer the best possible type of service for the given area. It is our duty to see that it does. In other respects the State must offer a variety of services—consultants, consultation clinics, nursing supervision, nutrition supervision, social service, educational aids, perhaps financial benefits, and so on—in aid to practitioners and other established services. The State must be trained to do this, for it must play an important role in our concept of complete care.

Now, finally, I should like to venture some comments on the place of the nurse-midwife in complete obstetrical care.

In the first place, it must be understood that you are specialists, that you are trained as specialists, and that you should be used as specialists. This means that your numbers will always be limited and that you must make the most of your abilities. Do not be led into channels of work that can be handled as well by someone else. There will always be too few of you, and your special talent should not be wasted. Axiomatic to this is the fact that your training must be of the best. There can be no compromise here. On the basis of this training, it seems to me you have several areas in which your service is unique.

In actual operations you are, first of all, the best suited individual practitioner in the economically marginal areas. I am not at all sure that you are not the best practitioners for the normal cases in some of the more financially fortunate areas which nevertheless have inadequate professional care. This, of course, is your traditional place in European practice. In all of the types of service I have listed above you are the doctor's assistant par excellence. And in all of your practice you have access to the home and perhaps even to the innermost thoughts of your mothers and their families in a way no one else has. This is an association that can grow with the years and in the fullest degree lead to the carrying out of the principles of complete obstetrical care of which we have been talking.

But your abilities should call you beyond practice alone. You must assume the task—along with others, of course—of training. This must be teaching with a vision, as you see the vision—teaching of your own group, of the community, of the mothers and families themselves, of the State—even of the doctors themselves! And I would like to stress this latter, though I must admit that this phase of your professional activities will call for a good deal of tact. Our present day training of obstetrical specialists, I believe, runs too heavily to the super-hospital type of service and leaves a great blank in the area in which most of world-wide obstetrics lies. Furthermore, all doctors in the privacy of their own thoughts will admit to being greatly in debt to nurses for the many practical methods they have learned from them, and for the inspiration of their service.

I should like to note also the peculiar advantages you have in doing research. I do not mean necessarily large, grant-type research — although your training would fit you eminently into this type of group research—but in the opportunity to observe at close hand in carefully studied groups factors which add up to real significance. Many of the great advances in medicine have come not from the large laboratories but from the inspired thinking of men working in humble and often extremely simple ways.

Yours is a magnificent opportunity and a great responsibility. I wish you well.

Samuel B. Kirkwood, M.D.,
Associate Obstetrician

MARIUS N. SMITH-PETERSEN

News of the death of Doctor Smith-Petersen came as a shock to every member of the MGH family. In his case the inevitable summons seemed to come far too soon to a leader in our midst who was at the height of his intellectual powers. But sober thought leads us beyond the first emotional reactions to our bereavement, to a consideration of the impact which his life has had on medicine and of the great debt which the Massachusetts General Hospital owes to him.

He chose to devote his energies to that branch of clinical medicine known as Orthopedics. Devotion to his patients was an outstanding feature of his personality. When he sat down to study a clinical problem, whether in the ward or with a private patient, he concentrated all of his intellectual powers upon it. In his lexicon there was no such thing as a "routine case" and he never adopted "routine methods". When he had completed his careful study of the problem he outlined with equal care the treatment which seemed best suited to the case. But methods of treatment which fell short of giving ideal results were always suspect and many hours of thought were devoted to devising better methods than had previously existed.

He established with every one of his patients an intensely personal relationship, the essential ingredients of which seemed on the part of the patient to be trust in his skill, and knowledge that he was wholeheartedly devoting himself to the solution of their problems. On Doctor Smith-Petersen's part there was an air of confidence and courage based on careful study, wise decision, and technical skill. He had also an unflagging optimism and a will to win which weigh heavily in the successful solution of apparently hopeless problems.

His powers of observation and analysis, his devotion to clinical orthopedics, and his persuasive, logical presentations made Doctor Smith-Petersen a teacher of great ability. An untold number of medical students, interns, residents, and graduate students have had their intellectual horizons broadened as they listened to his lectures or heard him discuss clinical problems on ward rounds. He loved to exercise his technical skill in the operating room. Here, as elsewhere, he was a perfectionist. Every operation was carefully planned and executed with all the skill he could muster. This technical skill and his careful handling of delicate body structures must have developed in no small degree from the influence of Harvey Cushing while he was a surgical house officer at the Peter Bent Brigham Hospital. He took great pride in his tools and was ingenious in developing special new ones to suit his particular needs. It is probably safe to say that no other orthopedic surgeon has developed as many new, useful instruments for use in the operating room.

Doctor Smith-Petersen studied for many years with unflagging enthusiasm the problems of the hip joint. Early in his career he developed a surgical approach to the hip which permitted excellent exposure without damage to the deep-seated structures. The Smith-Petersen approach has become a most useful avenue of access to the hip joint.

Another product of his fertile mind was the invention of the three-flanged nail (known universally as the Smith-Petersen pin) which revolutionized the treatment of intracapsular fractures of the hip. Before its use, the unfortunate, elderly patient who broke her hip faced months of painful immobilization and if she survived that ordeal there was little prospect that satisfactory function of the hip would ever be completely restored. The development of a safe, accurate method of reduction of intracapsular fractures of the hip and their fixation by the three-flanged nail has almost abolished this accident as a cause of death and has reduced the occurrence of non-union to a mere fraction of its former rate. This invention can truly be called a boon to humanity.

The problem of how to abolish pain and restore motion in mechanically deranged hip joints engaged Doctor Smith-Petersen's attention for over twenty-five years of his professional life. His early studies convinced him that the use of an interposed mold was sound mechanically and physiologically. Improvements in the design of the mold, in the operative technique, and in postoperative care were the inevitable results of his constant efforts to perfect this operation. He proved that arthroplasty of the hip could be successfully performed, and in the later years patients came to him in ever-increasing numbers from all over the world to exchange old hips for new ones. Undoubtedly there will be many further advances in the field of hip arthroplasty, but it was Doctor Smith-Petersen who blazed the trail.

For his colleagues and for the Massachusetts General Hospital Smith-Pete had an enduring affection. Many there are in the MGH family who count it a privilege to have been among his patients, his pupils, and his friends.

J. S. B.

THE SMITH-PETERSEN FOUNDATION

The Smith-Petersen Foundation is a fund established by a group of Doctor Smith-Petersen's patients. The income (or, under special conditions, the principal) is to be used for furthering orthopedic knowledge.

At the discretion of its medical committee (Dr. Otto E. Aufranc, Dr. Joseph S. Barr, and Dr. Morten Smith-Petersen) the funds can be used to care for certain types of hip conditions or indigent patients who have special problems. The funds can also be used to publish results of research in connection with orthopedics.

Grateful patients have added to this fund from time to time, so that it has reached a very useful amount. Many of Doctor Smith-Petersen's old students, medical associates, and other friends have also contributed; and a large number of patients, instead of sending flowers to his Memorial Service, contributed to this fund.

It is hoped that by additional gifts to the Smith-Petersen Foundation the Orthopedic Service will eventually have a very useful research fund. It was the wish of the original donor that others join in adding to the fund. At the present time research on hip surgery is being carried out with the income furnished by these contributions. If any of the readers of THE NEWS are interested, they may send their checks or securities to the Smith-Petersen Foundation, care of Charles Collins, 10 Post Office Square, Boston. All contributions made to the Foundation are deductible from Income Tax returns in the manner and to the extent provided by law.

* * *

By decree of the President of the French Republic dated February 17, Dr. Edward D. Churchill was granted the Cross of Knight of the Legion of Honor "as a token of appreciation for his remarkable achievements in the field of surgery, and of gratitude for his outstanding contribution in fostering closer co-operation between the scientists of the two countries".

The decoration was bestowed on July 14 by Monsieur Francois Charles-Roux, Consul General of France in Boston.

* * *

The General Surgical Services had the great pleasure of welcoming Dr. Michael E. De Bakey, Professor of Surgery, Baylor University College of Medicine, as Acting Chief from June 16 to July 1. The Daniel Fiske Jones Memorial Fund "to extend and improve the education of surgical residents and interns" has made it possible from time to time to invite distinguished surgeons from other cities and countries for periods of temporary service. Residence is provided at the Hospital and the visitor is in every way the guest of the House Staff.

Dr. De Bakey was an especially happy selection. Known personally and greatly esteemed by older staff members, he is not only an accomplished master of operative techniques but an outstanding scholar and writer. His dynamic personality and leadership made a lasting impression on all who worked with him during his residence with us.

The Board of Trustees, at their meetings on June 12 and 26, and July 17, voted:

To accept the resignation of Dr. James P. Ryan from the position of Dental Intern, effective June 1;

To promote to the position of Associate Anesthetist:
  Dr. Bernard D. Briggs
  Dr. John P. Bunker
  Dr. George E. Donaghy
  Dr. Donald P. Todd

To extend Dr. Fletcher H. Colby's appointment as Chief of Urology Service pro tempore;

To reappoint Dr. David Littmann as Clinical Associate in Medicine, effective July 1;

To change Dr. William H. Baker's title from Clinical and Research Fellow in Medicine to that of Assistant in Medicine, effective July 1.

To appoint:

Dr. Leland C. Brannon as Second Assistant Resident in Neurosurgery, for the period July 1 through December 31;

Dr. Benjamin Castleman as Chief of the Department of Pathology and, concurrently, to the permanent staff position for a Pathologist, established by vote of the Board of Trustees of March 20, both appointments to be effective immediately;

Dr. Joseph F. Cianciolo as Dental Intern, beginning July 1;

Dr. Maurice Fremont-Smith to the Board of Consultation, effective as of July 1, 1952;

Mr. L. Joseph LeBritton as Administrative Resident, beginning July 1;

Dr. Joseph J. M. McGovern as Out-Patient Resident on the Children's Medical Service, for the period July 1, 1953 through March 31, 1954;

Dr. Vernon H. Mark as Senior Resident in Neurosurgery, for the period July 1 through December 31;

Dr. Federico Mora as Second Assistant Resident in Neurosurgery, for the period July 1 through December 31;

Dr. William Pfeffer, Jr. as Assistant Physician to the Children's Medical Service;

Dr. Robb H. Rutledge as Second Assistant

Resident rather than Third Assistant Resident in Surgery, beginning August 1;
Dr. Robert T. Sceery as Assistant to the Children's Medical Service, beginning July 1;
Dr. Ernest A. Sneddon as Clinical Fellow in Anesthesia, with the duties of an Assistant Resident, effective August 15;
Dr. William K. Stephan as Assistant Resident in Anesthesia, beginning July 1, 1954;
Dr. Bernard B. Stone as First Assistant Resident in Neurosurgery, for the period July 1 through December 31;
Dr. Julio Toriello as First Assistant Resident in Radiology, beginning July 1;
Dr. Peter M. Tow as Assistant Resident in Psychiatry for six months, beginning January 1, 1954;
Dr. Jerome K. Walker as Dental Intern, beginning July 1.

At their meetings on June 10, 17, and 24, and July 15, the General Executive Committee voted:

To accept the resignation of Dr. Frederic L. Hoch from the position of Research Fellow in Biochemical Research, effective as of June 30;
To accept the resignation of Dr. Samuel R. Schuster from the position of Clinical Fellow in Pathology, effective as of July 1.

To promote:

Dr. John F. Burke from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Richard A. Currie from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 1;
Dr. Edward Dunn from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Walter M. Haynes, Jr. from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Clement A. Hiebert from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Richard N. Kleaveland from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Martin B. Levene from the position of First Assistant Resident to that of Resident in Radiology, beginning July 1;
Dr. Paul S. Russell, Jr. from the position of Second Assistant Resident to that of First Assistant Resident in Surgery, beginning July 15;
Dr. Frederick G. Shaffer from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1;
Dr. Jack E. Tetirick from the position of Third Assistant Resident to that of Second Assistant Resident in Surgery, beginning July 1.

To continue the appointments of:

Dr. Roy L. Byrnes as Third Assistant Resident in Pathology, for the year beginning July 1;
Ernst Simon, Ph.D. as Research Fellow in Biochemistry, through January 31, 1954.

To reappoint:

Dr. Chester C. d'Autremont as Clinical Fellow in Psychiatry, to work under the direction of Dr. Jessner in Child Psychiatry;
Dr. Robert Kagan as Clinical Fellow in Psychiatry, beginning July 1, to work in Child Psychiatry;
Dr. Louis C. Lasagna as Clinical and Research Fellow in Anesthesia, through May 15, 1954;
Dr. Nils Normann as Clinical and Research Fellow in Anesthesia, through January 31, 1954;
Dr. Albert Schilling as Clinical and Research Fellow in Medicine for one year, beginning July 1.

To appoint:

Dr. George S. Bascom as Clinical and Research Fellow in Surgery, effective when he receives his temporary license to practise medicine in this State;
Dr. Geoffrey N. Chandler as Clinical and Research Fellow in Medicine, effective September 1;
Dr. Richard B. Cohen as Clinical and Research Fellow in Pathology for one year, beginning July 1;
Dr. Jean H. Darche as Graduate Student Assistant in Surgery, effective July 1;
Dr. Hector M. del Castillo as Graduate Student Assistant in Surgery, effective July 1;
Dr. William S. Dingledine as Clinical and Research Fellow in Medicine, effective July 1;
Dr. William E. Fitzgerald, Jr. as Research Fellow in Psychology for one year, beginning September 15;
Dr. Nathaniel Gould as Clinical Assistant in Orthopedic Surgery, to assist Dr. Paul L. Norton, effective July 1;
Dr. Thomas H. Green, Jr. as Clinical Assistant in Surgery, effective July 1. He also has been granted the privilege of caring for the private patients of Dr. Meigs in the Baker Memorial and Phillips House;
Dr. Ottheinrich A. M. J. Hase as Clinical and Research Fellow in Surgery, effective when he receives his temporary license to practise medicine in this State;
Dr. Franz S. M. Herbst as Clinical and Research Fellow in Dermatology, effective when he receives his temporary license to practise medicine in this State;
Dr. John W. Keller as Clinical Assistant in Medicine, beginning July 1;
Dr. Gordon D. LaZerte as Clinical Fellow in Pathology for one year, beginning July 1;
Dr. Alfred J. Luessenhop as Clinical and Research Fellow in Neurosurgery, effective when he receives his temporary license to practise medicine in this State;
Dr. Angel A. Monti as Graduate Student Assistant in Neurology, assigned to the Electroencephalographic Laboratory, for the months of June, July, and August;
Dr. Andrew M. Park as Graduate Student Assistant in Neurology, assigned to the Electroencephalographic Laboratory, for the months of June and July;
Dr. Sholem Postel as Clinical and Research Fellow in Medicine, effective July 30;
Dr. William P. Rogers, Jr. as Clinical Assistant in Surgery, to work in the Tumor Clinic and Surgical Out-Patient Department effective July 1;
Dr. Nancy Rollins as Clinical Fellow in Psychiatry, for six months, beginning July 1;
Dr. Howard M. Spiro as Clinical and Research Fellow in Medicine, effective September 1;
Dr. Kyle Y. Swisher, Jr. as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Dr. John N. Walton as Clinical and Research Fellow in Neurology for one year, beginning November 1;
Dr. Vaughn Westermeyer as Clinical Fellow in Medicine, effective July 1.

On July 20 the Hospital opened a day nursery to care for pre-school children whose mothers are employed as part-time nurses in the Hospital. There is no charge for this service. Miss Jean Campbell, a qualified, friendly teacher, is in charge and is assisted by volunteers. The former Medical Laboratory room on the first floor of the Bulfinch Building has been painted and furnished with appropriate chairs, tables, play equipment, and a sand box. The children enjoy the freedom of the Bulfinch yard, including the Lezers' jungle-gym.

In setting up a day nursery the Hospital hopes to find a measure of relief in the shortage of nurses and a means of attracting married nurses back to their chosen profession.

MASSACHUSETTS EYE & EAR INFIRMARY

Two of the Infirmary staff are now on vacation in Europe.

Miss Isabel Whiting, Director of Social Service, sailed on July 1 for a nine-weeks' tour of the Scandinavian countries. Since then she has kept the Social Service Department entertained and informed about her trip with a series of post cards from Norway, Sweden, and Denmark. Her return is expected on September 9.

Dr. Charles L. Schepens, Assistant in Ophthalmology and Director of the Retina Foundation, is spending his vacation this summer in Belgium. Dr. Schepens is a native of Belgium, so his journey is actually a trip to his home.

Dr. David D. Donaldson, who has recently left the Retina Service, has received an appointment as Instructor in Ophthalmic Research from the Harvard Medical School. On completing his residency, Dr. Donaldson will resume full-time research activities at the Howe Laboratory.

Dr. Paul M. Runge, Assistant in Ophthalmology, has taken over the practice of Dr. Harry K. Messenger (*Oph.* 1934) at 313 Commonwealth Avenue. Dr. and Mrs. Messenger are traveling to New Zealand for an extended visit.

Miss Marilyn Myers, Executive Secretary of the Eye Bank, reports that a successful publicity campaign has resulted in 103 inquiries about donor forms for the Bank in the month of July, as compared with 25 in June.

This note arrived from Dr. Mourad Arnoux, from 606 Second Street, Brooklyn 15, N. Y.:

> I finished my special ENT residency in the Infirmary in June and left for New York City. I would appreciate very much your publishing the following in THE NEWS:
>
> "Doctor Arnoux is sincerely grateful for the nice treatment and wonderful teaching he received in the Infirmary, and sends his thanks and best regards to the director, staff, attending staff, and nurses. His special thanks go to his chief, Dr. LeRoy Schall, whose spirit of truth, equity, tolerance, sincerity, and devotion represents the real American ideals. Men gifted with this kind of spirit will keep to America its ever-growing greatness and its ever-human nobleness."

On August 9 Storrow House celebrated

its fifth birthday as our convalescent unit. There was a birthday cake with candles and gay table decorations in honor of the occasion.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in a few instances. It would save your editor considerable time and trouble if you would, PLEASE, REMEMBER TO INCLUDE THAT INFORMATION. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Cardiology

Scannell, J. G.
Recent advances in cardiac surgery. (Editorial)
Virginia M. Monthly 80:251-252.

General Medicine

Dobyns, B. M., Vickery, A. L., Maloof, F., and Chapman, E. M.
Functional and histologic effects of therapeutic doses of radioactive iodine on the thyroid of man.
J. Clin. Endocrinol. & Metab. 13:548-567.

Harwood, R.
Management of diabetes in the office and at home.
Geriatrics 8:311-323.

General Surgery

Waddell, W. R.
Parenteral nutrition.
Maryland State Med. J. 2:244-248.

Waddell, W. R., and Wang, C. C.
Effect of vagotomy on gastric evacuation of high-fat meals.
J. Appl. Physiol. 5:705-711.

Immunology

Waksman, B. H.
Specific white cell lysis produced by combination of rabbit antiserum to purified protein (ovalbumin, bovine gamma globulin) with homologous antigen. The role of non-precipitating antibody.
J. Immunol. 70:331-344.

Waksman, B. H., and Bocking, D.
Study with fluorescent antibodv of fate of intradermally injected proteins in rabbits.
Proc. Soc. Exper. Biol. & Med. 82:738-742.

Laboratory Science

Bucher, N. L. R., McGovern, N. H., Kingston, R., and Kennedy, M. H.
Factors affecting biosynthesis of cholesterol from acetate by rat liver homogenates. (Abstract)
Federation Proc. 12:184.

Taymor, M. L., McArthur, J. W., and Ingersoll, F. M.
The effect of interstitial cell stimulating hormone upon the uptake of P32 in the rat prostate.
In Surgical forum—Proceedings of the forum sessions, Thirty-eighth Clinical Congress of the American College of Surgeons, New York City, September 1952, Philadelphia, W. B. Saunders Company, pp. 317-321.

Zamecnik, P. C.
Incorporation of radioactivity from DL-leucine-1-C^{14} into proteins of rat liver homogenates. (Abstract)
Federation Proc. 12:295.

Neurology, Neurosurgery, and Psychiatry

Bakay, L., and White, J. C.
Pneumoencephalography in chromophobe adenomas of the hypophysis.
J. Neurosurg. 10:284-296.

Benda, C. E.
Research in congenital acromicria (Mongolism) and its treatment.
Quart. Rev. Pediat. 8:79-96.

Cobb, S.
For a generic classification of certain psychoses.
Am. J. Psychiat. 109:869-870.

Finesinger, J. E., Shands, H. C., and Abrams, R. D.
Managing the emotional problems of the cancer patient.
CA — Bull. Cancer Prog. 3:19-21; 24-31.

Otolaryngology

Kelemen, G.
La cavitá nasale della cavia negli esperimenti di farmacologia e esperimenti analoghi.
Arch. ital. di otol. 64:251-254.

Kelemen, G.
The nasal cavity of the guinea pig in pharmacological and other experimentation.
Biologica Latina 6:36-38.

Pathology

Morgan, W. S., and Castleman, B.
A clinicopathologic study of "Mikulicz's disease".
Am. J. Path. 29: 471-503.

Scully, R. E.
Gonadoblastoma: A gonadal tumor related to the dysgerminoma (seminoma) and capable of sex-hormone production.
Cancer 6:455-463.

Surgery — Reconstructive

Cannon, B., and Murray, J. E.
Further observations on the use of the split vermilion bordered flap.
Plast. & Reconstruct. Surg. 11:497-501.

Urology

Smith, G. G.
Three unusual cases of prostatic malignancy: adenocarcinoma with mucus cells; malignant lymphoma; leiomyosarcoma.
Tr. Am. A. Genito-Urin. Surgeons 44:10-17.

Miscellaneous

Farnsworth, D. L.
Doctors afield – Mark Hopkins: Physician, educator.
New England J. Med. 248:821-822.

Brief bits:—

Dr. Joseph S. Barr has returned from a three-months' leave of absence to serve as a member of a medical team in Indonesia, sponsored by WHO. He came back by way of Australia, New Zealand, and Honolulu. Dr. Barr has been appointed a member of the Medical Advisory Board of the Alfred I. duPont Institute of the Nemours Foundation.

Dr. Clemens E. Benda was elected President and Dr. Raymond D. Adams Vice-President of the American Association of Neuropathologists, at the last meeting of the Association, held on June 14.

Mr. Raymond Quick, Research Fellow in Physics, 1952, is returning to Strong Memorial Hospital, Rochester, N. Y., this fall. He went back to his native England this summer.

Dr. Laurence L. Robbins visited hospitals in England and Stockholm during the month of July, while he was en route to the Seventh International Congress of Radiology, held in Copenhagen. By special invitation he read a paper on "The roentgenologic diagnosis of benign tumors of the bronchus and lung".

Dr. J. Gordon Scannell has delivered two lectures at meetings outside the Hospital. On April 15 he talked on "The surgical reconstruction of the superior vena cava" before the New England Surgical Society; and on June 4 he spoke on "Emergencies of the lung and esophagus" at the American Medical Association Meeting.

Dr. Robert T. Sceery announces the opening of his office for the practice of Pediatrics at 109 North Main Street, Cohasset, Massachusetts.

Dr. Somers H. Sturgis was promoted to Associate Clinical Professor of Gynecology at Harvard Medical School in June, and also to the position of Surgeon (Gynecology) at the Peter Bent Brigham Hospital. Dr. Sturgis is a Director of the American Society Study of Sterility, and this spring was appointed Associate Editor of *Fertility and Sterility,* their bimonthly publication.

Drs. Jacob H. Swartz and Earl A. Glicklich announce the removal of their offices to Suite 125, Hotel Braemore, 464 Commonwealth Avenue, Boston.

* * *

Dr. Edward B. Benedict has sent us this interesting account of the Benedicts' trip to Europe:

Dr. Patricia H. Benedict and I left for Europe April 15 and returned June 30. During the early part of our stay in France we had a pleasant visit with Dr. Maurice Donat in Nice and visited the hospital where he does his thoracic surgery. Dr. Donat was a visitor to our Surgical Clinic here about a year ago. He is physician to the Prince of Monaco.

While in Italy we enjoyed a visit with Dr. Carlo A. Montagnani in Florence. It will be recalled by some of you that Dr. Montagnani worked here in our Surgical Research Laboratory several years ago.

In Switzerland we were entertained by Dr. Ernst Hafter, a gastroenterologist of Zurich, who visited our Endoscopy Clinic in 1950. We were also entertained in Braunwald by Dr. Erwin Sommer. Dr. Sommer was here several years ago as a patient on Ward 4 and a visitor to Dr. Albright's group. He is in charge of a sanatorium for chest diseases in a gorgeous location high up in the Alps, about a two-hours' ride from Zurich.

In London Dr. Patricia Benedict gave a talk at the invitation of Dr. Russell Fraser (res. fel. *M.* 1938-40) at the Hammersmith Hospital, Postgraduate Medical School, reporting some studies of amenorrhea in groups of patients from the Ovarian Dysfunction Clinic. She also spoke on "Idiopathic hypercalcuria" at the Royal Society of Medicine, Section of Endocrinology. This was a report on patients from the MGH Stone Clinic. While she visited the Metabolic Ward of the University College Hospital with Dr. Chester Dent, I was spending my time with two prominent London surgeons – Mr. Norman R. Barrett at St. Thomas's Hospital and Mr. Ronald W. Raven.

In Leeds we were house guests of Mr. and Mrs. Philip R. Allison. Mr. Allison is well known for his esophageal surgery, and was a visitor here a few years ago. During my stay in Leeds I gave a lecture on "Endoscopy".

In Birmingham we were house guests of Mr. and Mrs. A. L. d'Abreu. At the Queen

Elizabeth Hospital we were shown every courtesy, and at Mr. d'Abrau's private hospital for thoracic surgery I took part in a discussion on bronchoscopy. It will be recalled that Mr. d'Abreu was a visiting surgeon here in 1951 and that Mrs. d'Abreu, S.R.N. St. Thomas's Hospital, London, did volunteer nursing here at this hospital and recently wrote of her MGH experiences in a British nursing journal. Dr. Patricia Benedict spent some time with Dr. A. C. Crook at his Department of Clinical Endocrinology of the United Birmingham Hospitals.

In Cambridge Dr. Paul Fourman (res. fel. *M.* 1948-49) delighted his visitors by taking them punting past the Backs, affording an excellent view of the colleges. Dr. Victor Coxon (res. fel. *M.* 1950-51) introduced us to Oxford.

Our next medical adventure took us to Knokke, Belgium, to a meeting of the International Bronchoesophagological Society, where I presented a paper by Dr. Richard H. Sweet and me on "Achalasia: A study of bouginage and surgical therapy".

In Paris Dr. Patricia Benedict gave a talk before the laboratory group at the Henri Rousselle Hospital, and also talked after Dr. André Lichtwitz's Saturday A.M. clinic at the Lariboisiere Hospital at the invitation of Dr. Jeannine Crepeaux (clin. & res. fel. *C.M.* 1951-52). During my stay in Paris I visited Professor Moutier's Clinic on Gastroscopy. Dr. Moutier is a delightful elderly Frenchman with a white beard. He was kind enough to entertain us at dinner. When some remarks were made about the richness of the food and alcoholic beverages and their association with gastritis, Dr. Moutier remarked, "To live is to have gastritis!"

Having become one of the old men in white at the M.G.H. and one who at last should soon be finishing up by one process or a combination of the usual processes, i.e., retirement (so far, the M.G.H. has no house officer pension program), death from old age, or graduation, I have been extended an invitation to submit a blurb to THE NEWS—a sort of valediction, I suppose, or maybe just any old thing. As this sad tale unfolds, you can see that more of the latter has been submitted.

My first encounter with this grand old institution was in the fall of 1943 as a 3rd year medical student in the Medical OPD. The patient at hand was a taxi driver who was suffering with indigestion. He volunteered the information that each day he consumed 2 to 3 bottles of "tonic". Having transferred only a few days before from the South—where tonic means Beef, Iron, and Strychnine or Swamp Root or SSS (Doses: 1 tablespoonful 4 times a day)—I felt that even though these were very good agents, this man's trouble was too much tonic. My instructor insisted and proved by roentgenograms that the diagnosis was duodenal ulcer. Thus, I learned the true nature of a Boston tonic. I still believe he drank too much.

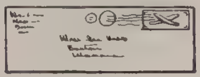
My most difficult case was a problem in the management of the family of a patient in urology. An old gentleman was afflicted with an enlarged prostate causing obstruction to urine flow, an elevated NPN, and cloudy cerebration. We were especially sympathetic because he and his wife were alone in this world. The necessity of his operation had been realized some months prior to admission but had been deferred so that the patient and his wife could become reconciled to it. Both were pessimistic. She did not want to be left behind alone, and he did not exactly want to leave. He was finally admitted after realizing that the operation was the best assurance of maintaining their social *status quo* and after convincing the wife that we would take extra special care of her loved one. (We always do that at the M.G.H.) She seemed pleased with her decision on admission, but was very upset on her first visiting day to find her husband sporting a black eye. (He had received this in a fall when he got out of bed, against our very definite orders, during the night.) He was very confused and could not explain the condition to his wife. She felt that someone had struck him and that he was being abused. Therefore, home he was to go! With difficulty, however, she was convinced of the truth and the patient remained under our care.

As if this wasn't more than enough, on the second hospital day, while receiving an infusion, the patient caused the glass connecting tube to get broken, whereby 1500 cc. of 5% D/W drained directly upon the floor. Into this large puddle of sugar water a small amount of blood drained from the patient's end of the tube and fairly well stained the puddle. At this very moment the wife arrived for her second visit and saw what she thought was the result of a bleeding procedure. The writer had never before, nor has he ever since, done a quicker soft shoe dance! To our great relief, the patient finally had a successful operation and all were very happy.

Undoubtedly, my only contribution here was made in the department of neurosurgical anesthesia. I discovered that by taking a box of crackers and a quart of milk from the operating room canteen and one of those containers found only on a male ward—by taking these in under the drapes with me (the neurosurgical anesthetist usually sits buried in under the drapes), I could almost outstay the neurosurgeon (14 hours on one gloomy occasion).

In a more serious vein, I would like to echo Dr. George Richardson's remarks made in an earlier issue of this paper (THE NEWS, March 1953). I am extremely grateful to this institution for the best surgical training in the world, for the financial assistance (House Officers' Loan Fund) which made it possible for me to meet emergencies for my family and me without seeking aid elsewhere, and for the very good *medical* care I received during a recent illness (January 29-July 1) that might otherwise have been serious for me.

Ernest S. Crawford, M.D.,
Resident in Surgery



New addresses:—

Dr. James H. Averill (*M.* 1947), 249 Crescent St., Northampton, Mass.
Dr. Lawrence J. Barrows (r.p. *N.* 1952; r.p. *N.P.* 1953), Hospital of the University of Pennsylvania, 3400 Spruce St., Philadelphia, Pa.
Dr. Samuel P. Bessman (res. fel. *Biochem.* 1953), Children's Hospital, Washington, D. C.
Dr. Samuel Brendler (sr.r.s. *N.S.* 1953), New England Center Hospital, 171 Harrison Ave., Boston, Mass.
Dr. George R. Burland (a.r.s. 1953), Olds, Alberta, Canada.
Dr. Garth R. Drewry (*M.* 1953), 994 Sumner Ave., Springfield, Mass.
Dr. Harold E. Elrick (*M.* 1944), Radioisotope Unit, Veterans Administration Hospital, Denver, Colo.
Dr. Mary S. Fisher (*M.* 1949), 7716-A Lucretia Mott Way, Elkins Park, Pa.

Dr. Richard H. Watson (*C.M.* 1952), Strong Memorial Hospital, Rochester, N. Y.

Another response from an MGH "singleton"—this one from Dr. Robert P. Keiser (*Or.* 1942), from Coral Gables Clinic, Coral Gables, Florida.

Most of us are rather reticent to talk about ourselves. However, in answer to your request for a little "activities news", here goes.

I have been associated in the practice of Orthopedic Surgery with two other partners since my discharge from military service late in 1945. In general, we "Crackers" feel that this particular area has no equal as a place to live and practise medicine. Contrary to general opinion, the Miami area is not purely a resort area where millionaires loll in the sun for three months and then scamper back north. Actually, the community is very stable and is growing by leaps and bounds in its stable population.

Hospital facilities, grossly inadequate immediately after the war, have been enlarged with the increase in population to the point where they more than satisfy all our needs. A children's hospital has come into existence, where we handle all of our crippled children's work and all of our poliomyelitis cases.

A new medical school, started by the University of Miami in this area, will become an integral part of the Jackson Memorial Hospital units, which have expanded considerably in the past six to seven years.

All of these facilities form an integral part of our orthopedic practice; and while we do not have the background, prestige, and well-earned reputation of the M.G.H. and its unexcelled facilities and staff, we are attempting to climb the ladder.

Year-round access to the outside without developing chilblains gives us unlimited recreational facilities in fishing, golfing, boating, etc.

Dr. William McK. Jefferies (*E.M.* 1942) sends us this account of his many activities out there in Cleveland:

I am still attached to the staff at Western Reserve University School of Medicine, having been here since I left M.G.H. in the summer of 1949. Since I am the only clinical endocrinologist at University Hospitals, I am kept quite busy with the adult endocrine clinic, children's endocrine clinic, fertility clinic, and tumor clinic, in addition to teaching and research. During the past two years, the planning of a revised curriculum in our medical school has also taken a great deal of time, but it has been extremely fascinating.

The new program was initiated last fall and the first year has been a great success, judging by reactions of students and faculty alike. Its outstanding feature has been a complete breakdown of departmental barriers in an attempt to present medical education in a better correlated and more stimulating fashion. Other transplanted MGH-ers who are actively participating in this program are "Simmy" Simeone, Brown Dobyns, and Bill Clark.

Our two boys are now aged five and two. We look forward to our return visits to New England when we can see our friends in Boston.

This letter has come from Col. Milton S. Thompson (*Or.* 1934), with notice of his transfer to Europe:

After seven years plus, here at Brooke Army Hospital, I am being transferred to Germany. Moving has its merits, like cleaning out your bureau drawers, only more so. It has drawbacks, too, not the least of which is severing teaching connections with Baylor. Four of our orthopedic residents are presently candidates for their Master degrees through an affiliation with the Graduate School.

We have grown to like Texas very much, particularly San Antonio, its climate, and its people, and will miss it. Furthermore, the family cannot come over for perhaps six months, but we are looking forward to our new assignment and will leave our latchstring out for any wandering MGH-ers (as soon as we get a latch and a house behind it).

I am enclosing a check to ensure my continuing to receive The News.

A short note has come from Dr. Frank R. L. Egloff (r.p. *Psychiat.* 1951). He writes:

I am to be released from the Air Force in September, following which I'm going to open an office in Hartford for the practice of General Psychiatry. Of equal importance is the arrival of our fourth dependent some time late in August.

Our new home address is 69 Meadow Lane, West Hartford, Connecticut.

This letter has come from Dr. Robert H. Detwiler (*C.M.* 1940), in response to our appeal for news about him. From Arlington, Virginia, he writes:

So little has happened outside my office routine, I hardly know what to say. This last year, however, I did get into politics on a local level and now find myself one of the commissioners in a town of over 150,000 people. It is quite an education, but leaves me little free time. I do not believe I shall run again, but I would very much like to see some other professional man take my place. I feel that a doctor has much to offer in the running of a community of this size — particularly in health and school policies.

Needless to say, I enjoy receiving The News, and will always remember my stay at the Massachusetts General as one of the most instructive and pleasant in my career.

THE NEWS

No. 127 Boston, Mass. October 1953

OUR TEN YEAR PLAN

Anyone visiting the M.G.H. today for the first time in many years is bound to notice the great changes that have taken place in the physical plant of the Hospital. All for the better, we believe, and more changes of the same kind are in the books for the immediate future. Sometimes members of the staff or older graduates of the Hospital ask, "Isn't the new building ever going to stop?", or "Don't you plan ever to leave the Bulfinch lawn alone?", or "What are the plans, if any, for the future development of the Hospital?"

The answer to this last question is also the answer to the other two, as well. There *is* a plan for the future development of the Hospital, and in order to set some target date for the accomplishment of this plan it is always referred to as the "Ten Year Plan".

The Ten Year Plan evolved from a simultaneous study made, at the request of President Conant, in all the teaching hospitals connected with the Harvard Medical School. It was accepted in 1951 by the Trustees of this Hospital and the Corporation of the University; and so, if all goes according to schedule, it will be completed in 1961—the 150th anniversary of the incorporation of the Hospital.

An outline of the Ten Year Plan and the financial requirements necessary to complete it have been announced twice—once at the dedication of the Research Building in May 1951, and again in December of the same year in the local press. The Plan explains briefly what has happened to the purchase value of the Hospital's endowments during the postwar inflation. In order to furnish the same number of patient days of charitable service as were provided by the Hospital in 1941, at least $6,600,000 more in endowment is needed. Furthermore, the full-time medical and surgical staff must be increased if we are to provide adequately for the patient care, teaching, and research activities of the Hospital in the future. Over the next ten year period, in collaboration with the Medical School, the Hospital hopes to increase the full-time staff by nine additional professors and associate professors. The minimum endowment required by the Hospital and the Medical School together for this alone, including a small budget for each, will be at least $7,500,000. Also, a minimum endowment of $1,000,000 for the new Research Building is needed to pay for light, heat, and other indirect costs not covered by overhead items on research grants.

In 1951, at the same time that these minimal endowment needs were announced, the Ten Year Plan sketched out the new building plans for the M.G.H. during the next ten years. These will require a total of more than $7,000,000.

Surveys made in Greater Boston indicate that there is now an adequate number of hospital beds to meet the community's requirements in the foreseeable future, so the emphasis in the building program will be on improvement and modernization of the MGH plant. As everyone who walks the corridors of the Hospital knows, there are still many buildings that might be considered relics of our distinguished past. Some of them have been adapted to new uses—such as Ward E, the old stables, and the power house; others will be evacuated by the present occupants and then adapted to new uses—such as the old Pathology Building, which will be the new home for the maintenance shops. But to effect all the changes new buildings must be built in order that some of the old ones can be demolished. So the Ten Year Plan spells out the new building needs as it was seen through the trustees' crystal ball of A.D. 1951. At the head of the list was the new Nurses' Home and a Nurses' Training School; next, a new Pathology Building; followed immediately by a new Ambulatory Clinic to incorporate the present program of the O.P.D. with modern concepts for handling patients of all income brackets on a clinic basis; attached to this building will be a Doctors' Office Building, long visualized as an important addition to the Hospital. Dr. Clark described in the following words the philosophy behind these two units, at the dedication of the Research Building:

"At present, patients from all walks of life may, for bed care, benefit from the research and education carried on at the Massachusetts General Hospital, whether they are private, semi-private, or general hospital patients, but out patients may obtain these benefits only if they are financially needy. This seems an unfair discrimination against those in more comfortable circumstances. Our staff believes that the services of our highly trained personnel and complex equipment should be utilized as fully as possible by the whole community."

As they read the balance of the list, any member of the staff or graduate of the M.G.H. will immediately appreciate the urgency of the situation, and we hope that graduates of the Hospital will help us make our hopes a reality by making their own contributions or by telling us where gifts may be found for one or more of these projects. They are:

1. New house officers' quarters, and a new auditorium—both of which are needed if the Hospital is to meet its present undergraduate and graduate teaching responsibilities and extend the opportunity for teaching and research to a greater number of students whose medical education at the M.G.H. can help to resolve the national shortage of doctors.

2. Renovations to improve the efficiency of the operating rooms and X-ray Department.

3. Last but not least, a new laundry and maintenance shop. One of the trustees, Francis W. Hatch, suggests in verse a unique opportunity to memorialize the donor:

A monument to Harkness, the Harvard Houses stand,
A son of Yale extending, the monumental hand.
The beauty of the Esplanade which you'll enjoy tomorrow,
Forever keeps the memory green, of Boston's James J. Storrow.
And Rockefeller's Williamsburg will treasure, first and last,
The wisdom for the future in the lesson of the past.
Oh Heaven, where's our angel, where walks the kindly feller,
Who'll do his benefacting in the M.G.H.'s cellar?
There in the swirling soapsuds, we'll wash his sins away
And starch his memory fresh and clean, a dozen times a day;
So if at Christmas, once again, you find you're in a quandary,
How in the name of humanity, would you like to give a laundry?

The Ten Year Plan presents a challenge to the trustees and staff of the Hospital. Something has already been accomplished in the two years since the Plan was announced. As far as the endowment needs are concerned, we are constantly announcing these in one way or another. The new type of brief annual report describes the endowment needs and tells people how to make gifts and bequests to the Hospital. It is felt that the future endowment requirements will largely be met, as in the past, by generous bequests from a grateful community. Since 1951 we have received a few of these, which have gone into the General Fund. We are making progress toward our goal, but we have a long way to go. At the same time the endowment fund for the Research Building has been started and has now grown to more than $100,000. This year the trustees announced their plans to raise an endowment for Research and Teaching. This will be their share of the $7,500,000 which the Hospital and Medical School must find before 1961. Mr. Francis C. Gray, Chairman of the Board of Trustees, has written a number of personal letters to people who have shown a continuing interest in the welfare of the Hospital over a period of years, and gifts large and small are coming in to this fund, which we hope will reach its goal in the next few years. Others are helping to further the work of individual departments and services—such as the Smith-Petersen Foundation—through separate endowments.

As far as the building plans go, it is gratifying to be able to report, as you all know, that one unit of the new Nurses' Residences has been subscribed, planned, and built. Today 154 student and graduate nurses are housed in this building, named Bartlett Hall in honor of the Reverend John Bartlett, who first saw the need for the Hospital in 1810.

A second building, a five-story west wing for the Baker Memorial, is in the final planning stages, and ground will be broken for this in 1954. It will house Pathology and Dermatology, and will help resolve some of the problems of the X-ray Department by combining the Phillips House and Baker x-ray units on the second floor of Baker. These buildings will be connected by new first and second floor corridors from Phillips House to Baker. A new public entrance on Charles Street for Baker patients may also be provided. Other possible features of this building, depending upon the availability of funds for this purpose, include a floor for Neuropathology and Neurology and one for Psychiatry. These additions, if they can be made, will ease the pressure on space in the Bulfinch Building.

Next year every effort will be made to raise the necessary funds for the new Ambulatory Clinic. The present Out-Patient Building was opened in 1903 and enlarged in 1927. This was at a time when the average age of patients was about 35 years. It was also designed to handle the entirely different types of disorders and diseases of thirty or forty years ago. When diagnosis made in the Medical Clinic indicated typhoid, diphtheria, pneumonia, or malaria (those diseases most frequently seen at that time), the patient was usually hospitalized and treated by rest, diet, baths, or hydrotherapeutics. In the new Ambulatory Clinic diagnosis of disease or disorder will be made and when treatment involves the administration of drugs that require no hospitalization, the patient will be sent home, this to be followed by subsequent visits to the Clinic or by the Home Care Service of the Hospital. The emphasis in the new Ambulatory Clinic will be on bringing the diagnostic, research, and clinical services of the Hospital to the patient, and this service eventually will be available to him in the new Clinic without regard for his financial status. The present O.P.D., of course, is available only to those in limited circumstances. The new Ambulatory Clinic will be available to all. The Ambulatory Clinic will be the focal point and central facility for the sick within the framework of the General Hospital. Although it is difficult to visualize what this building will look like, it will in all probability be located as an ell to the Connecting Building and present O.P.D. bridging or, possibly, crossing Fruit Street, and will be parallel to North Grove, extending back to the jail wall. The shops now located in the old stable will be relocated in the old Pathology Building and Power House, so that the stables can be torn down. When the new Ambulatory Clinic is built, the old O.P.D. will be made over for the Nurses' Training School, thus accomplishing another step in the Ten Year Plan.

As the plans for the future unfold, many smaller changes that have already been made can be explained. The new nurses' home made it possible to demolish some of the buildings on Parkman Street; the closing of Fruit Street from North Grove to Blossom has permitted the enlargement of the Bulfinch lawn, opening the vista from North Anderson Street. The generous interest of a beloved member of the Board of Trustees has made possible the landscaping of the Bulfinch lawn and that between the White Building and the Phillips House, so that they may be permanently enjoyed by all.

The Hospital is following several changes in the community that are in the offing beyond the Ten Year period. For several years studies have been in the making concerning the area north of the Hospital, from Allen Street to the North Station. The Urban Redevelopment Section of the Boston Housing Authority has studied this area carefully and has made specific recommendations in its preliminary report which might result in a new middle-income housing development in this area. The Hospital has enlisted the counsel of Mr. Robert M. Morgan, Vice President of the Boston Five Cents Savings Bank and former President of the Boston Real Estate Board, as consultant in these affairs, as the Hospital is very much interested in the future of this area.

Several studies are being made simultaneously of the area south of the Hospital. The future of the Suffolk County Jail has been discussed for many years. Drs. Earle Chapman and John Cass have been working with the Boston Legal Department on several ideas that might allow the city to turn over this area and buildings to the Hospital. The General Court has set up a Recess Commission this summer to study the various plans and they will make recommendations that might speed the acquisition of the jail property. Dr. Dean A. Clark has been appointed by Governor Herter to this commission, and their meetings this autumn and winter will give the Hospital a better indication of when, if ever, the acquisition of the jail property will become an actuality. Mr. Thomas Joyce, Legislative Agent for the Utilities Industry, is acting as consultant for the Hospital in this matter.

The Hospital is also working with the Urban Redevelopment Section of the Boston Housing Authority on plans which might assist the Hospital in acquiring additional property bordered by Grove Street, Blossom Street, and Cambridge Street. This is also being studied for the Hospital by Mr. Morgan. This plan might provide for a wide access to the Hospital from Cambridge Street, on the site of Anderson Street.

For a number of years the Hospital has been following closely the development of the various traffic arteries in the area and has, with the permission of the Metropolitan District Commission, acquired exclusive parking privileges, together with the Eye and Ear Infirmary and the jail, in the new area beneath the clover leaf at the Charles Street circle, between the hours of 8:30 and 5:30 daily. This, and the acquisition of the Cambridge Street Garage and the development of new parking areas on Hospital property, cleared by demolition of old houses, has done much to ease the parking crisis of two years ago.

Credit for the growth of the Hospital must be shared by the staff and employees, past and present. The acquisition of the funds necessary to implement the plans outlined above will be forthcoming only as the record and renown of the Hospital grows. A generous community, in gratitude for the service of the M.G.H. in the past and present, will provide for the future. Under the leadership of the Board of Trustees and the General Director the future of the Hospital is promising. The help, advice, and vision of the staff—both professional and nonprofessional—have created the atmosphere for the growth of Massachusetts General in the future.

David C. Crockett,
Associate Director for Resources and Development

* * *

On July 18, Dr. Churchill was elected an Honorary Member of the Thoracic Society of England.

* * *

Dr. Ellsworth T. Neumann, until recently Executive Officer at M.G.H., has been appointed Administrator of the Hospital, effective September 1. In this capacity Dr. Neumann will continue to serve as Chairman of the Administrative Committee and to supervise the operation of the Baker Memorial. In addition, he will be responsible for the day-to-day operation of the entire Hospital. In Dr. Clark's absence, he will attend meetings of the Trustees and of the various committees of the Staff.

* * *

Miss Marjorie L. Shea has been appointed Associate Community Relations Consultant at the Massachusetts General Hospital, where she will work with Mrs. Soma Weiss, our Community Relations Consultant.

Miss Shea is thoroughly familiar with the functions of voluntary hospitals, as she has been the Public Relations Officer at the New England Medical Center for the past six years. She was previously Executive Secretary of the Alumnae Association of Simmons College, of which she is a graduate.

MASSACHUSETTS EYE & EAR INFIRMARY

On August 31 and September 1, Dr. W. Morton Grant of the Howe Laboratory presented a two-day course entitled "Ophthalmic toxicology", as one of the Lancaster Courses in Ophthalmology. These courses, sponsored by the Ophthalmological Study Council, were given at Colby College through the summer months.

During the summer several doctors started their residencies at the Infirmary. In Ophthalmology—Dr. Alfred W. Scott, on July 1; Dr. S. James Bullington, on October 1. In Otolaryngology—Dr. Robert E. Klotz, on July 1; Dr. Stuart M. Frame, on August 15; and Dr. William Patterson, on September 1.

On August 19, Dr. Samran Wangspa arrived at the Infirmary from Thailand. He will start his residency next year, after he has become better acquainted with our language. Meanwhile, he is taking postgraduate courses in Otolaryngology.

On September 12, Dr. David G. Cogan, Director of the Howe Laboratory, spoke on "Some common eye disorders in older people", at Ocean City, Maryland. His talk was part of a medical symposium held under the joint auspices of the Maryland Academy of General Practice and the Lederle Laboratories. Dr. Cogan then traveled on further to Charleston, North Carolina, where the North Carolina Ear, Nose and Throat Society and the South Carolina Society of Ophthalmology and Otolaryngology were holding a joint meeting on September 14 through 16. There Dr. Cogan presented three papers: "Neuro-ophthalmic syndromes", "Lesions of the corneal stroma", and "Dizziness as a symptom of ocular disturbance".

Dr. Charles I. Johnson, Surgeon in Otolaryngology, will deliver a lecture at the Medical Military Symposium for military and civilian physicians and allied professions, at the U. S. Naval Hospital in Chelsea on October 12. His subject will be "Osteomyelitis of frontal bones: Complicating acute frontal sinusitis". Dr. Johnson holds the rank of Captain, MC, USNR.

The Board of Trustees, at their meeting on August 21, voted:

To accept with regret the resignation of Dr. George E. Donaghy, Associate Anesthetist, effective September 14;

To accept the resignation of Dr. Merle A. Haanes, Assistant in Dermatology, effective September 1;

To accept with regret the resignation of G. David Novelli, Ph.D., Associate Biochemist, effective September 1;

To accept with regret the resignation of Dr. Thomas F. Paine, Jr., Chief of the Bacteriology Department and Assistant Physician, effective September 21;

To accept the resignation of Paul A. Srere, Ph.D., Assistant Biochemist in Research Chemistry, effective September 1.

To appoint:

Dr. William R. Buchanan, Jr. as Intern on the Children's Medical Service for one year, beginning July 1, 1954;

Dr. Melvin J. Glimcher as Assistant Resident on the Orthopedic Service for one year, beginning July 1, 1954.

The Trustees also voted:

That the appointment of Dr. Oscar B. Williams, Jr., as Assistant Resident in Anesthesia, become effective as of July 27 instead of October 1;

That the Children's Medical Service be permitted to appoint an extra Intern for the year beginning January 1, 1954, in place of an Assistant Resident who has not been able to accept her appointment.

At their meetings on August 12 and 19, the General Executive Committee voted:

To continue the appointments of:

Dr. Herbert B. Locksley as Clinical and Research Fellow in Neurosurgery, through December 31;

Dr. Athol G. Riddell as Clinical and Research Fellow in Surgery for one year, beginning October 1.

To reappoint:

Dr. Julian J. Goodman as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of July 1.

To appoint:

Dr. Saul Aronow as Research Fellow in Physics, effective as of July 20;

Dr. Jose V. Bado as Research Fellow in Neurology, for a period of four months, beginning September 1;

Dr. Dorette K. Bashour as Graduate Student Assistant in Medicine, effective as of March 1;

Dr. Willard Dalrymple as Clinical Assistant in Medicine, beginning August 1;

Dr. Alejandro Jimenez as Research Fellow in Neurology, for the period September 1 through December 31;

Dr. Ming K. Wang as Research Fellow in Medicine, assigned to the Allergy Clinic, effective as of August 10;

Dr. Ruth S. Weiss as Clinical and Research Fellow in Psychiatry, effective as of July 1;

Dr. Paul G. A. J. Wilkin as Clinical and Research Fellow in Surgery, assigned to Gynecology, beginning September 1.

* * *

Dr. Benjamin Castleman, Chief of our Pathology Department, was invited to present a paper on the value of the clinico-pathological conference before the First World Conference on Medical Education, held in London during the last week in August. Although this exercise is taken for granted in this country and is, as Professor Arnott of Birmingham, England, called it, "A powerful educational influence which is emulated throughout the New World", until recently it has not been used very generally outside the United States. However, it was gratifying to learn from the discussions at this meeting that many institutions in various parts of the world are now holding sessions modeled after the MGH C.P.C.'s.

While in London, Dr. Castleman visited with Dr. George Cunningham at St. Bartholomew's, with Dr. G. R. Cameron at University College, and with Dr. A. G. E. Pearse at Hammersmith Postgraduate Hospitals. A very pleasant afternoon was spent with Mr. and Mrs. Geoffrey Keynes at their country house outside Cambridge. Mr. Keynes, a famous British surgeon, known to many for his thymectomies in myasthenia gravis, is perhaps better known in England as an authority on Blake and for his collection of rare books and first editions. He showed Dr. Castleman many of his treasures, including a letter written by Isaac Newton to Robert Boyle.

At the annual meeting of the American Electroencephalographic Society, the following officers were elected:

President: Dr. Mary A. B. Brazier, Massachusetts General Hospital
President-elect: Dr. Earl Walker, Johns Hopkins Hospital
Secretary: Dr. W. T. Liberson, Hartford Hospital
Treasurer: Dr. Charles Henry, Institute of Living, Hartford

The Conseil des Organisations Internationales des Sciences Médicales (under the auspices of UNESCO) has arranged for a symposium on "Thalamo-cortical relationships and their bearing on problems of consciousness", to which they have invited 20 delegates, representing 9 different countries. Dr. Brazier has been invited as a delegate from the United States. The meeting will be held in Canada.

HYPERTENSION RESEARCH LABORATORY

For the last six years investigations have been conducted by members of the cardiovascular department of this Hospital on the relationship of the central nervous system to circulatory regulation. One phase of this work has been concerned with the long-term assessment of the effect of lumbodorsal sympathectomy in patients with hypertensive vascular disease, and the other with physiological studies directed at determining the anatomical regions of the brain that may be related to circulatory regulation and emotional expression.

In view of the contradictory opinions of the therapeutic value of sympathectomy for patients with hypertension, a study of this question was reopened at this Hospital in 1947 when Dr. Kenneth A. Evelyn, McGill Medical School, Montreal, was asked to review the surgical results in patients operated upon during the previous 2-8 years. The main defect in this study was due to the inadequate length of the follow-up period. Work is now under way to review the status of these same patients after a further lapse of 6-7 years. So far as possible the results of this long-term follow-up of surgical treatment will be compared with the results of medically treated cases both from this Hospital and from the Royal Victoria Hospital, Montreal.

The studies of the relationship of certain brain structures to circulatory regulation have been carried out in patients undergoing psychosurgery for psychiatric disease or intractable pain. For this purpose, we have been fortunate in having access to patients and the collaboration of members of the Neurosurgical Department at this Hospital and workers at outside institutions. These collaborators include Dr. Hannibal Hamlin, who has been in charge of the studies carried out on patients at the State Hospital for Mental Diseases, Howard, Rhode Island; Drs. James L. Poppen and Kenneth Livingston, Lahey Clinic; Dr. Harry C. Solomon, Boston Psychopathic Hospital; Dr. Robert B. Livingston, formerly at Yale Medical School and now at the University of California Medical School, Los Angeles; Dr. Jose Delgado, Department of Physiology, Yale Medical School; and Drs. James C. White, William H. Sweet, and Mary A. B. Brazier, at this Hospital.

The initial stimulus for the regional brain studies as they relate to the circulation was the reported observation that psychotic patients with hypertension had a fall in blood pressure after frontal lobotomy. Systematic study in such patients proved that this impression was incorrect. Investigation of the general problem was then continued by employing the well-established neurophysiological technique of electrical stimulation of the brain. In our patients, areas were stimulated that were accessible during the operative exposure for psychosurgery. It was found that electrical stimulation of several regions of the surface of the brain caused a decrease or cessation of breathing, elevation of blood pressure and, on occasions, a decrease in heart rate. The areas from which these responses were obtained were similar to the regions from which similar results had been found in animals by a large number of investigators. Such areas, according to the comparative anatomists, represent the more ancient regions of the brain in the phylogenetic scale. Our patients were electrically stimulated while under anesthesia which presented certain difficulties in the interpretation of the results. One could not be certain but that the responses might be due to the spread of current over pain-sensitive structures in the cranial cavity, such as blood vessels and the covering of the brain. Clinically it is a well known fact that changes in circulatory function involving the brain may take place in association with changes in emotion. Anesthesia prevented our knowing if the patient experienced pain or emotional changes at the time of electrical stimulation. A way had to be found, therefore, in which such observations could be made in the conscious patient. With the assistance of Dr. Delgado, electrodes were constructed which enabled the neurosurgeon to perform the desired neurosurgical procedure by electrical coagulation with electrodes placed inside the brain. At the same time these electrodes could also be used to study the function of the particular regions of the brain prior to destruction by electrical coagulation. These electrodes are now used in several medical centers in this country and abroad. Preliminary observations indicate that this new development in technique may be helpful therapeutically as well as in gaining a better understanding of brain function. For instance, prior to their use, lobotomy had to be done by a knife which destroyed more than the desired areas of the fiber tracts of the frontal lobes. Now these areas can be reached by only a needle puncture and the region destroyed by electrical coagulation.

As these electrodes can be left in for days, much pertinent information can now be gained from electrical stimulation and electrical recording of brain waves while the patient is free of anesthesia or other medications. There are certain brain areas, which may be related to pain sense and possible emotion and behavior patterns as well as to circulatory regulation, that are small and require precise skull x-ray measurements for identification. A sterotaxic apparatus designed for use in humans by Paul McPherson and Dr. William H. Sweet and modified by us permits access to these regions. The instrument, with the aid of measurements of skull and brain markings, delivers the electrodes to the brain structures selected for therapeutic destruction and study.

Our experiences thus far with this new technique, which has made possible observations in the conscious patient, have been encouraging. We now know that the circulatory and respiratory responses previously mentioned can be obtained with the patients not reporting pain or other discomfort. It has been surprising to find that brain areas destroyed by frontal lobotomy have not thus far given rise to clear cut emotional or behavior changes during electrical stimulation. There are a few exceptions about which there is a difference of opinion as to interpretation. The electrical recordings from the depths of the brain are compared to cortical and conventional scalp recordings. The results appear interesting. Many more studies are essential before the meaning of such electrical activity for the patient's illness or for physiology will become apparent.

William P. Chapman, M.D.,
Assistant in Medicine

ESTABLISHMENT OF A BERYLLIUM CASE REGISTRY

A man-made illness of considerable interest has been reported in the medical literature in this country since 1943 under various titles, in general referring to its association with exposure to certain beryllium compounds. As the years go by, more cases continue to appear from a variety of industrial and research operations which use beryllium compounds. With funds supplied by the Atomic Energy Commission, it is planned to develop a Beryllium Case Registry at the Massachusetts General Hospital. The purpose is to make possible a study of the epidemiology of this disease, an evaluation of the beryllium hazard of incriminated operations, and the dissemination of knowledge of the clinical course of beryllium poisoning, especially in relationship to its medical management. The material collected is to be available for study, and from time to time data will be sent to participating physicians, summarizing facts that have been established.

This description of the project is being published with the hope that physicians, roentgenologists, and pathologists, who have knowledge of cases of beryllium poisoning, will wish to participate in making this Beryllium Case Registry as complete as possible. We have facilities and funds for prompt handling of any material that is submitted—such as case records, x-rays, and tissue. It is planned to enter cases anonymously in the registry.

We welcome any correspondence on the subject, and urge particularly the cooperation of all members of the MGH Staff.

Our telephone extension here at the Hospital is 820.

Harriet L. Hardy, M.D.,
Associate Physician

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of The News, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The classification of material still continues to be omitted in a few instances. It would save your editor considerable time and trouble if you would, PLEASE, REMEMBER TO INCLUDE THAT INFORMATION. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to The News.

The following new titles have been received:

General Medicine

Burrage, W. S., and Irwin, J. W.
Microscopic observations of the pulmonary arterioles, capillaries, and venules of living mammals before and during anaphylaxis.
J. Allergy 24:289-296.

Neurology, Neurosurgery, and Psychiatry

Bakay, L.
Studies on blood-brain barrier with radioactive phosphorus. III. Embryonic development of the barrier.
A.M.A. Arch. Neurol. & Psychiat. 70:30-39.

Bakay, L., and Sweet, W. H.
Intra-arterial pressures in the neck and brain. Late changes after carotid closure, acute measurements after vertebral closure.
J. Neurosurg. 10:353-359.

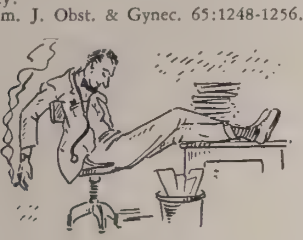
Orthopedic Surgery

Barr, J. S., Elliston, W. A., Musnick, H., DeLorme, T. L., Hanelin, J., and Thibodeau, A. A.
Fracture of the carpal navicular (scaphoid) bone. An end-result study in military personnel.
J. Bone & Joint Surg. 35-A, no. 3:609-625.

Cave, E. F.
Injuries to the wrist joint.
In American Academy of Orthopedic Surgeons. Instructional course lectures, Ann Arbor, J. W. Edwards, vol. 10, pp. 1-26.

Pathology

Scully, R. E.
Hyperestrinism in old women: Report of a case with cortical and medullary hyperplasia of the ovaries and possible adrenal hyperactivity.
Am. J. Obst. & Gynec. 65:1248-1256.



BIOGLETS

Dr. William D. Cochran, Assistant Resident on the Children's Medical Service—born in St. Paul, Minnesota, March 1, 1923; U.S. Naval Air Corps: 1942-46—training in U.S., service in Iwo Jima and Okinawa, 1944-45; A.B., Harvard College, 1948; M.D., Harvard Medical School, 1952; Intern in Medicine, Children's Medical Center, Boston, 1952-53; married; three children; temporary home: Waltham, Massachusetts.

Dr. Ralph C. Darling, Jr., Intern on the Children's Medical Service — born in Richmond, California, August 28, 1927; U.S. Marine Corps: American Legation, Peiping, China, 1945-46; A.B., Boston University, 1949; M.D., Boston University School of Medicine, 1953; married; one daughter; home: Taunton, Massachusetts.

Dr. Pierre M. Dreyfus, Assistant Resident in Neurology—born in Geneva, Switzerland, October 14, 1923; U.S. Army: Counterintelligence Corps, Military Intelligence Agent, 3d and 7th Armies, France and Germany, 1944-46; B.S., Tufts College, 1947; M.D., Columbia University College of Physicians and Surgeons, 1951; Intern and Assistant Resident in Medicine, New York Hospital, Cornell Medical Center, New York, N. Y., 1951-53; married; home: Boston, Massachusetts.

Dr. Howard S. Frazier, Intern in Medicine—born in Oak Park, Illinois, January 16, 1926; University of Chicago, 1942-44; U.S. Navy: Western Pacific Area, 1944-46; Ph.B., University of Chicago, 1948; M.D., Harvard Medical School, 1953; married; one son; permanent address: Champaign, Illinois.

Dr. Lamont W. Gaston, Intern in Medicine—born in Sterling, Kansas, July 29, 1926; U.S. Army: United States and Philippine Islands, 1944-46; A.B., University of Kansas, 1950; M.D., University of Kansas, 1953; home: Lawrence, Kansas.

Dr. Robert G. Greene, Assistant Resident in Orthopedic Surgery—born in New York, N. Y., November 13, 1924; A.B., Franklin and Marshall College, Lancaster, Pennsylvania, 1943; M.D., University of Pennsylvania School of Medicine, 1947; Intern, Lenox Hill Hospital, New York, N. Y., 1947-48, and Roosevelt Hospital, New York, N. Y., 1948-49; Resident in Orthopedic Surgery, Lenox Hill Hospital, 1949-50; Assistant Resident in Orthopedic Surgery, Children's Medical Center, Boston, 1950; U.S. Navy, 1951-52: Lieutenant (jg), U.S. Naval Hospitals, Charleston, South Carolina, and Portsmouth, Virginia; Surgical Team 15, U.S. Naval Hospital, Yokosuka, Japan; 1st Provisional Casual Company, Kyoto, Japan; C Medical Company, 1st Marine Division, Munsan-ni, Korea.

Dr. Parker Heath, Jr., Assistant Resident in Medicine—born in Detroit, Michigan, June 12, 1924; A.B., Williams College, 1946; M.D., University of Michigan Medical School, 1948; Rotating Internship, Union Memorial Hospital, Baltimore, Maryland; Student Health Service, Wisconsin General Hospital, Madison, Wisconsin, 1949-50; Resident, City of Detroit Receiving Hospital, Detroit, Michigan, 1950-51; U.S. Navy, 1951-53: Lieutenant (jg), Great Lakes Naval Hospital and Annapolis Naval Hospital, Bureau of Medicine and Surgery; 3-months' course in Photofluorographic Interpretation; Medical Officer in charge of X-ray Department, Boston Naval Shipyard; married; two daughters; home: Wellesley Hills, Massachusetts.

Dr. J. Drennan Lowell, Assistant Resident in Orthopedic Surgery—born in Worcester, Massachusetts, April 9, 1922; Harvard College, Class of 1944; M.D., Harvard Medical School, 1946; Intern, General Surgery, Boston City Hospital, 1946-47; U.S. Army, 1947-49: Captain, Stuttgart, Germany; Assistant Resident, General Surgery, Emory University Hospital, Emory University, Georgia, 1949-50; Research Fellow in Vascular Surgery, Emory University, 1950-51; Assistant Resident, Orthopedic Surgery, Children's Medical Center, Boston, 1951-52; home: Worcester, Massachusetts.

Dr. David J. L. Luck, Intern in Medicine—born in Milwaukee, Wisconsin, January 7, 1929; S.B., University of Chicago, 1949; M.D., Harvard Medical School, 1953; home: Milwaukee, Wisconsin.

Dr. Joseph J. M. McGovern, Out-Patient Resident on the Children's Medical Service and, concurrently, Research Fellow in Hematology, Children's Medical Center, Boston—born in Boston, Massachusetts, August 29, 1925; Boston Latin School, Class of 1943; U.S. Navy: Pharmacist's Mate 2/c, 1944-46, assigned to Marines in Epidemiology Unit, 1945-46; A.B., Boston University, 1947; M.D., Georgetown University, 1951; Intern, Children's Hospital, Washington, D. C., 1951-52; Junior Assistant Resident, Children's Medical Center, Boston, 1952-53; Polio Foundation Resident to Epidemic Polio Area, Vicksburg, Mississippi, 1952; married; one son.

Dr. Harold L. May, Intern in Surgery—born in Peekskill, N. Y., August 19, 1926; attended Harvard College; U.S. Army: Air Corps, 1945; M.D., Harvard Medical School, 1951; Intern in Medicine, University of Minnesota Hospitals, Minneapolis, 1951-52; Assistant Resident in Medicine, Boston City Hospital, 1952-53; home: Poughkeepsie, N. Y.

Dr. Russell M. Nelson, Assistant Resident in Surgery—born in Salt Lake City, Utah, September 9, 1924; B.A., University of Utah, Salt Lake City, 1945; M.D., College of Medicine, University of Utah, 1947; Intern in Surgery, University of Minnesota Hospitals, Minneapolis, 1947-48; Fellow in Surgery, University of Minnesota Hospitals, 1948-51; U.S. Army, 1951-53: Captain, Surgical Staff, Walter Reed Army Medical Center, Washington, D. C.; Army Surgical Research Team, Japan and Korea, 1951; married; three daughters.

Dr. James A. Petersen, Assistant Resident in Radiology—born in Dannebrog, Nebraska, June 22, 1924; Wheaton College, Wheaton, Illinois, 1942-44, 1946-47; U.S. Army: 80th Infantry Division, Europe, 1944-45; B.S., College of Medicine, University of Illinois, 1949; M.D., College of Medicine, University of Illinois, 1951; Intern, Worcester City Hospital, Worcester, Massachusetts, 1951-53.

Dr. John F. Radebaugh, Jr., Intern on the Children's Medical Service—born in Springfield, Massachusetts, January 10,1925; U.S. Army: Infantry, Armored Division, 1943-45; 27th Infantry, Okinawa, 1945; 11th Airborne Division, Japan, 1945-46; B.S., Bates College, 1948; M.D., Harvard Medical School, 1952; Intern, rotating, Mary Hitchcock Memorial Hospital, Hanover, New Hampshire, 1952-53; married; two sons; present address: Belmont, Massachusetts.

Dr. Désiré J. A. Rebello, Assistant Resident in Dermatology—born in Paris, France, September 17, 1921; Bachelor of Medicine and Bachelor of Surgery, University of Bombay, Bombay, India, 1947; Medical Education at the Seth Gordhandas Sunderdas Medical College, Bombay; Diplomate in Venereology and Dermatology, University of Bombay, 1950; House Physician in the Department of Venereology and Dermatology, King Edward VII Memorial Hospital, Bombay, May to October 1950; Assistant in Dermatology, Bai Jerbai Wadia Hospital for Sick Children, Bombay, 1951-53.

Dr. Edgar J. Schoen, Assistant Resident on the Children's Medical Service—born in New York, N. Y., August 10, 1925; B.S., University of Illinois, 1945; M.D., New York University College of Medicine, 1948; Intern, Lincoln Hospital, New York, N. Y., 1948-49; Clinical and Research Fellow on the Children's Medical Service, Massachusetts General Hospital, 1949-50; Intern on the Children's Medical Service, Massachusetts General Hospital, July through November 1950; U.S. Navy: Flight Surgeon with the Atlantic Fleet, 1950-52.

Dr. Stanley Sober, Assistant Resident in Orthopedic Surgery—born in London, England, March 19, 1924; M.B. and B.S., University College and Hospital, University of London, 1947; worked in Slough Emergency Hospital and Lister Hospital, England, 1947-48; Italien Hospital and Government Hospital in Haita, Israel, 1948-50; and in Jewish Hospital, Brooklyn, N. Y., before coming to Massachusetts General Hospital; married.

Dr. Raymond D. Sphire, Assistant Resident in Anesthesia — born in Detroit, Michigan, February 12, 1927; U.S. Air Force: 1st Lieutenant, in United States and Europe, 1944-46; B.S., University of Detroit, 1948; M.D., Loyola Medical School, Chicago, Illinois, 1952; Intern, Grace Hospital, Detroit, Michigan, 1952-53; married, September 5, 1953.

Dr. John B. Stetson, Assistant Resident in Anesthesia—born in Chicago, Illinois, March 18, 1927; U.S. Navy: Combat Aircrew, 1945; M.D., Harvard Medical School, 1951.

Following my internship here on the East Medical Service in 1946-47, I became a servant of the Senior Surgeon in the Navy Medical Corps (1947-49), and subsequently worked in basic research pertinent to the histochemistry of the skin.

None of these activities has removed my site of operations beyond a 3- or 4-mile radius from the General. My Navy duty was in a permanent installation carefully reserved for Reserves—the Boston Naval Shipyard Dispensary.

My introduction to basic research technique came in two enjoyable years spent in the Department of Anatomy at the Harvard Medical School, where, under the guidance of Drs. G. B. Wislocki and E. W. Dempsey, I was engaged in an exploration of the histochemistry of normal skin and wound healing. Here, too, was my first encounter with the callous gaze of H.M.S. I.

Thus initiated, in July of 1951 I joined the staff in Dr. Frazier's Dermatological Research Laboratory, the aims and activities of which have been eloquently stated in Dr. Frazier's report which appeared in

No. 42 in a series of Staff photographs
Mr. David C. Crockett, Associate Director for Resources and Development

the March 1953 issue of The News. My associations there were with colleagues whose common interest in the biochemistry of skin and whose varied scientific backgrounds made for a broadening and wholly gratifying experience. During these past two years my own endeavors were focussed on the principal biosynthetic products and function of the skin, keratins, and keratinization.

My recent re-entry into the clinical realms has been effected in anticipation of pursuing that commendable brand of dermatology advocated by Dr. Frazier.

George F. Odland, M.D ,
Assistant Resident in Dermatology

New addresses:—

- Lt. Irving P. Ackerman, MC, USNR (*M.* 1951), H & S Co., 2nd Bn., 9th Rgt., 3rd Mar. Div., FMF, c/o Fleet Post Office, San Francisco, Calif.
- Dr. Dulcie E. Blunden-Morris (a.r.p. *An.* 1953), 306 Patterson Court, Takoma Park, Md.
- Dr. Peter T. Brooks (*E.S.* 1943), Walla Walla Clinic, Walla Walla, Wash.
- Dr. Ben Eiseman (*E.S.* 1943), Veterans Administration Hospital, Denver, Colo.
- Dr. Lucie J. Jessner (r.p. *Psychiat.* (*McL.*) 1939), Massachusetts General Hospital, Fruit St., Boston 14, Mass.
- Dr. Susanne J. Lamdin (*C.M.* 1953), 31 2nd St., Hamden, Conn.
- Dr. Thomas F. Paine, Jr. (c. *B.* and a.p. 1953), University of Michigan Medical School, Ann Arbor, Mich.
- Lt. William A. Tisdale, MC, USAR (*M.* 1952), 30th Medical Group, APO 301, c/o Postmaster, San Francisco, Calif.

Brief bits:—

A card has arrived from Lt. James J. Ferguson, Jr., MC, USNR (*M.* 1951) announcing the arrival of a son, James J. Ferguson, III ("Terry"), on August 26. Dr. Ferguson is stationed at Quonset Point, Rhode Island. His home address is 15 Penguin Avenue, East Greenwich, R. I.

Dr. Vincent P. Perlo, Assistant in Neurology on our Staff, announces the opening of his office for the practice of Neurology, at 412 Beacon Street, Boston 15, Mass.

When we wrote to Dr. James A. Halsted (*W.M.* 1932), asking for a more accurate address for him than the one we had, we suggested that he include an account of his professional activities out there on the west coast. In reply, this nice letter from him has arrived:

> Thank you for your note. My address is Veterans Administration Center, Los Angeles 25, California. I have been here for three years.
>
> This is a large center, with a general hospital (Wadsworth V. A. Hospital, which has 1,100 medical and surgical beds), a neuropsychiatric hospital, and a domiciliary home. The general medical research and radioisotope units are quite extensive, and some very active teaching and research activities are going on at this institution. We are closely affiliated with UCLA Medical Center, which is a mile away. I am in charge of activities relating to gastroenterology at the V.A. Center and am an Associate Clinical Professor of Medicine at the University of California (Los Angeles).
>
> I would like to receive The News regularly. Please send me a bill for a subscription.

This message from Lt. James M. Davis, MC, USAR (*S.* 1948), Tokyo Army Hospital AU 8059, APO 1052, c/o Postmaster, San Francisco, California, was written on his subscription card:

> We enjoy The News so very much. The only MGH-ers presently in Tokyo are Austin Vickery, Bob Scully, and I.
>
> Will write soon. My family arrived in Tokyo in April. Very little else of interest has happened since I last wrote.

We were glad to receive this letter from Dr. Richard T. Barton (*Otolar.* 1945), from Beverly Hills, California.

> Here at last are a few progress notes concerning my activities since I left the Eye and Ear Infirmary.
>
> My service in the Navy consisted of five days at the U. S. Naval Hospital, St. Albans, Long Island, a year at sea in the North Atlantic, and then out to the Mariana Islands on a destroyer-escort. Thereafter, I was assigned to the U. S. Naval Hospital, San Diego, California, where I was later separated and returned to civilian life.
>
> For the past seven years I have been practising in Beverly Hills and teaching at both the University of Southern California, where I am an Instructor in Surgery, and the University of California at Los Angeles, where I am an Associate Consultant in Otolaryngology. I am an Attending Specialist on a very interesting service at the local Veterans Administration Hospital, where ENT has been abolished and absorbed as a general surgical service called the Head and Neck Service. As a result of my experience in this field, I was invited to read a paper entitled "Neoplasms involving the carotid artery" at the International Congress of Otorhinolaryngology in Amsterdam in June.
>
> After the Holland meeting, my wife and I went to Italy for a couple of weeks' vacation, and then home to the same old grind.

This short letter from Dr. W. Robert Harris (a.r.s. *Or.* 1952) was enclosed with his subscription to The News:

> Since leaving M.G.H. a year ago, I was fortunate enough to be awarded a McLaughlin Travelling Fellowship by the University of Toronto and have spent the past ten months visiting orthopaedic centers in Scandinavia and Great Britain. I hope to get off a proper account of this in due course. In the meantime I have started practising here with the Toronto General Hospital and, as you see, I am not so overwhelmed by private patients that I haven't time to drop you a line!

These very few words, but very much appreciated ones, have come from Dr. E. Grey Dimond (clin. fel. *M.* 1949). From the University of Kansas Medical Center, Kansas City, Kansas, he writes:

> The News is most enjoyable. I circulate my copy among our staff and it is probably our most popular "journal".

THE NEWS

No. 128 Boston, Mass. November 1953

DEPARTMENT OF PATHOLOGY

It is about ten years since the first drawings for a new pathology laboratory were prepared. These and many others have been worked over for countless hours but were scrapped when the Research Building was erected or when the sites for the building were changed. At the present writing it does appear very hopeful that ground will be broken next summer.

The building will be "L" shaped: the long arm of the "L" will project to Charles Street as a west wing of the Baker Memorial, running parallel with and between the Thayer and the corridor now connecting Baker Memorial with the Phillips House; the short arm of the "L" will connect with the Phillips House. Old Ward E, now occupied by dermatology research laboratories, will have to be sacrificed.

Pathology will occupy the basement, first, and second floors; Neurology and Neuropathology the third, and Dermatology Research the fourth floor. There will be adequate space for experimental pathology, and one of the highlights of the building will be the Tracy Burr Mallory Memorial Library overlooking the Charles.

It is well known that there is a great dearth of pathologists throughout the country. This scarcity is not because fewer men are choosing pathology as a specialty, but because the demand has increased. Most hospitals of 100 beds or more are seeking full-time pathologists to be in charge not only of pathologic anatomy, but of all branches of clinical pathology, including bacteriology, chemistry, hematology, blood bank, and cytology. The pathologist often is the only full-time physician in the hospital. In order to help supply this demand and to prepare men for the American Board of Pathology in both pathologic anatomy and clinical pathology, the trustees have approved a four-year residency program which includes, in addition to pathologic anatomy, rotation through the various clinical pathological laboratories and also a four-month period at the Memorial Hospital in Worcester with Dr. Ronald Sniffen. The program is sufficiently elastic, however, to enable those residents who prefer to limit themselves to pathologic anatomy and research to do so.

Since many of the small suburban hospitals, especially those of under 100-bed capacity, cannot support a full-time pathologist and even if they could would be unable to secure one, the Department of Pathology at the Massachusetts General Hospital has begun in a small way to supply pathology service to a few of these hospitals. This service consists of assigning one of the assistant pathologists to be the liaison between the laboratory and the suburban hospital. He attends their monthly staff meeting, at which he reports on the autopsy findings in their cases (these having been done by our resident staff) and conducts an educational exercise usually in the form of a Clinico-pathological Conference. The surgical specimens are sent to the Massachusetts General Hospital by either messenger or mail. This service is very valuable to all concerned: the suburban hospital gets the opinions of a large teaching hospital laboratory with its routine laboratory work; the pathologist has an opportunity to inform the suburban hospital staff about what is going on at the Massachusetts General Hospital and in this way many of the puzzling cases are often referred to the Massachusetts General; the pathologist learns the point of view of the general practitioner and has an opportunity to see how medicine is practised away from the ivory tower. There is no doubt that our affiliations with the Emerson Hospital in Concord, the Brockton Hospital, and more recently with the Lawrence Memorial Hospital in Medford have fostered good public relations with the medical community in those areas.

With the acquisition of space on the fourth floor of the Domestic Building and with the aid of financial grants, the members of the Pathology Department have recently been able to expand their research activities. In addition to problems of clinico-pathological correlation that have been the mainstay of the department for many years, projects dealing with the histochemical and experimental approach have been started. Dr. Agnes S. Burt is studying the anterior pituitary in neoplastic disease, with special reference to the effects of steroid hormone therapy. Dr. Richard B. Cohen, a product of the Seligman School of Histochemistry, has been applying various techniques to the adrenal glands removed surgically from patients with hypertension, Cushing's syndrome, and neoplastic disease. With Drs. Sniffen and Fred A. Simmons, he has begun a histochemical study of the function of the interstitial and Sertoli cells of the testis in relation to spermatogenesis in the normal, infertile, and diseased states. In connection with Dr. Castleman's interest in the thymus gland in myasthenia gravis, Dr. Cohen is applying a specific acetylcholin esterase tissue stain to muscle and thymus removed from patients with myasthenia gravis.

Dr. Winfield S. Morgan, after having spent a year at Oxford in the Cytology Division of the Zoological Laboratory, under Dr. John R. Baker, is continuing his studies on the Golgi apparatus in mouse pancreas homogenates and observing the effect of the Coxsackie virus on the Golgi network.

A closer relationship between the pathology laboratory and the laboratories in the Research Building has recently been consummated by the appointment of Dr. Edgar B. Taft, a research fellow in the Huntington Laboratory and well trained in pathology, as an assistant pathologist. He has been spending half time in the laboratory and has proved to be very valuable in analyzing both routine and research projects. His flair for architecture has resulted in his being given the job of working with the architects in planning the new Pathology Building. Another liaison with the Research Building has been effected by having Dr. David Kahn, one of the assistant pathologists, devote half his time with the Arthritic Research Group, under Dr. Bauer. Other less formal ties with clinical and research groups, such as Dr. Robert H. Fennell's association with the Gynecologic Service, Dr. Morgan's association with the Thyroid Clinic (substituting for Dr. Austin L. Vickery, Jr., who is with the Army), and Dr. Wilbur A. Thomas's interest in cardiac problems, have developed over the years.

Benjamin Castleman, M.D.,
Chief, Department of Pathology

Contributions to THE NEWS in the amount of $555.50, over and above the subscription fee, were received during the fiscal year 1952-1953. Notes of appreciation are always sent promptly to each contributor, but THE NEWS takes this opportunity to express publicly its thanks for such generosity from so many of its readers.

* * *

Dr. René J. Dubos, member of the Rockefeller Institute for Medical Research, will give the Warren Prize Lectures of the Massachusetts General Hospital for 1953 at 4:30 P.M. in the Auditorium of the Museum of Science, Boston, on the subject "Biochemical aspects of infection". The lectures will be given on the following dates:

Monday, November 9
Wednesday, November 11
Friday, November 13
Tuesday, November 17
Thursday, November 19

The Trustees of the Hospital hope that

all members of the staff will be interested in attending. It would be helpful to the committee planning the receptions following the lectures if you would let Dr. Clark know if you are planning to attend. Self-addressed cards have already been sent out for this purpose.

* * *

The construction job disaster in Everett occurred on October 3. The following Monday Dr. Clark sent out this letter to all our staff members and non-professional employees:

> My compliments on the rapid and efficient way things were set up for emergency treatment of accident casualties last Saturday.
>
> Although we received only two of them it seemed likely for a time that there would be many more, and it was obvious that a much larger group would have been taken care of promptly and well.

The Board of Trustees, at their meeting on September 18, voted:

To accept the resignation of Dr. Jay L. Hoffman from the position of Clinical Associate in Psychiatry.

To reappoint:

Dr. John M. Head as Third Assistant Resident in Surgery, effective September 15;

Dr. John D. Pitts as Second Assistant Resident in Surgery, effective September 1.

To appoint:

Dr. Sheamus Dundon as Associate Physician pro tem to the Children's Medical Service, for the period September 21 to October 26;

Dr. William F. Ketchum as Assistant Physician to the Children's Medical Service;

Dr. Alexander L. Zaoussis as Assistant Resident in Orthopedic Surgery for one year, beginning January 1, 1954.

The Trustees also voted:

To change the title of the Committee on Nurses to the "Trustees' Committee to the School of Nursing and Nursing Service", with the following membership:

Mr. John E. Lawrence, Chairman
Mr. Lloyd D. Brace
Mrs. Robert Homans
Dr. Chester M. Jones
Dr. J. Gordon Scannell
Mrs. Lloyd D. Brace
Mrs. W. K. Jordan
Dr. Dean A. Clark
Miss Ruth Sleeper
One vacancy to be filled

To change the title of the Ladies' Advisory Committee to the "Advisory Council to the School of Nursing", with the following membership:

Mrs. Lloyd D. Brace, Chairman
Miss Dorothy Bartol
Miss Daphne Corbett
Miss Betty Dumaine
Miss Sigrid Edge
Mrs. Van Courtlandt Elliott
Mrs. Harris Fahnestock
Mrs. Robert Homans
Mrs. Paul Jones
Mrs. W. K. Jordan
Dr. Rita M. Kelley
Miss Cecile Littlefield
Mrs. Thomas Motley
Mrs. Thorvald Ross
Miss Mary M. Sullivan
Mrs. Ralph Wetmore
Miss Barbara Williams

Ex officio Members
Miss Ruth Sleeper, Dr. Dean A. Clark, Mrs. J. H. Means

Honorary Members
Mrs. Arthur W. Bell
Mrs. Henry Bigelow
Mrs. G. Tappan Francis
Miss Sally Johnson
Mrs. John R. Post

At their meetings during September, the General Executive Committee voted:

To terminate the appointment of Dr. John A. Benson, Clinical and Research Fellow in Medicine, as of September 30.

To extend the appointments of:

Dr. Luis I. Arias as Clinical Fellow in Medicine, assigned to Cardiology, through October 31;

Dr. Joseph B. Tanner as Senior Resident in Orthopedic Surgery, from January 1, 1954 through March 31, 1954.

To promote:

Dr. Thomas L. DeLorme to the position of Senior Resident in Orthopedic Surgery, beginning April 1, 1954, for a period of one year.

To appoint:

Dr. Winston E. Cochran as Clinical and Research Fellow on the Children's Medical Service, for the period September 1, 1953 through August 31, 1954;

Dr. Walter R. Eberlein as Clinical and Research Fellow on the Children's Medical Service, beginning September 8;

Dr. Waldo L. Fielding as Clinical Assistant in Surgery, assigned to Gynecology for one year, in order that he may assist Dr. Langdon Parsons in the care of his patients at the Baker Memorial and Phillips House;

Dr. Thomas Frank as Clinical Assistant to the Children's Medical Service, effective as of August 15;

Dr. Lowell P. Hager as Research Fellow in Biochemistry, effective as of September 1;

Dr. Peter L. Hurst as Clinical and Research Fellow on the Children's Medical Service, for the period beginning September 1;

Dr. Gustavo Mogollon as Graduate Student Assistant in Pathology for one year, beginning September 15;

Dr. Robert B. Sloane as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Robert M. Todd as Clinical and Research Fellow on the Children's Medical Service, for a period of six months, effective as of September 23;

Yale J. Topper, Ph.D. as Research Fellow in Biochemistry, effective as of September 1;

Dr. Joseph M. Zucker as Clinical Fellow in Psychiatry, effective as of September 15.

Dr. Peter E. Sifneos, Assistant in Psychiatry at the Massachusetts General Hospital, has been appointed part-time Associate Psychiatrist to the McLean Hospital. He began his duties there on September 1.

* * *

NUTRITION CLINIC

The chief purpose of the Nutrition Clinic is to interpret to the ambulatory patient the physician's dietary prescription in terms of "what to eat" and "what not to eat", adapted to his socio-economic status.

How may the dietitian aid in the dietary treatment of the patient? First, a dietary history will determine the patient's usual food habits. This forms a basis for establishing good, sound nutrition, modified to the therapeutic needs of the individual. The education of the patient is simplified by setting up sample meals with wax models, suggesting available low-cost foods and various ways of preparing foods.

The poor dietary intake of the elderly patient who lives alone is often influenced by the common belief that milk furthers constipation, by poor teeth which interfere with the use of foods requiring chewing, and by loneliness, economic stress, and the physical difficulties involved in procuring or preparing food. We emphasize the importance of an adequate diet to these patients and are glad to give suggestions for preparing easily digestible foods, as a protection against prolonged malnutrition.

Approximately 60% of the 1200-1500 new dietary instructions given each year are for weight reduction. Those patients having the determination to change their eating habits will lose 1 to 2 pounds a week until their ideal weight is reached. A maintenance diet will then be given, based on three well-balanced meals which include the essential foods. Because of financial reasons the patient is often reluctant to return to the Nutrition Clinic unless he is visiting another clinic. Therefore, frequent reviews of diet instructions which have been given are arranged on a consultation basis to coincide with the time of the patient's return visit with his doctor. The cooperation of the physician in recognizing this need of follow-up usually results in more careful adherence to the prescribed diet.

The trend toward low sodium diets in this Clinic is shown by an increase from 20 in 1945 to 300 in 1953. The accepted terms "Low sodium", "Moderately low sodium", and "No added salt", as approved by the Medical Staff in the *Diet Manual of the Massachusetts General Hospital,* have helped to effect more accurate and efficient interpretation of the physician's diet order. The low sodium diet means not only the restriction of salt, but also of baking soda, regular baking powder, food products containing sodium compounds, and certain vegetables and protein foods having a high sodium content. Terms such as "Low salt", "Salt free", "Salt poor", etc. should be discouraged, since the dietitian is obliged to call the physician to find out exactly what is being ordered.

The dietary education of the diabetic patient has been simplified by the adoption of *Meal planning with exchange lists,* a booklet developed by a joint committee of the American Dietetic Association, the American Diabetes Association, and the Public Health Service. Since 1950 we have used 1,200 of these booklets in our Diabetes Clinic. Diabetics have reacted favorably since they can discuss their diets with other diabetics and find that the same procedure is now used in many different institutions. There is considerable psychological value in the greater variety of foods offered, permitting the patient to live a more normal life and allowing him to choose food with greater ease when eating away from home. In addition to the initial individual dietary instruction, which usually takes an hour, group demonstrations covering some phase of dietary care are given by one of the dietetic interns.

The Nutrition Clinic Staff includes two graduate dietitians and three dietetic interns who spend six weeks of their year's dietetic internship in the Clinic. We are fortunate during the busy morning hours from 9 to 12 in having volunteers who assist in admitting and weighing patients, answering the telephone, and procuring patients' records.

The Nutrition Clinic is open from 8:30 A.M. to 4:30 P.M., with the exception of Tuesdays, Fridays, and Saturdays, when it closes at noon. A dietitian is assigned to the Medical Clinic on Tuesday and Friday afternoons, to give dietary instruction to patients being referred during the time of the Diabetes Clinic, which is held on Tuesday and Friday afternoons. This arrangement has allowed the dietitians in the Diabetes Clinic to devote more time to the education of the diabetic patient without interruption, and also has been a great convenience to the Medical Staff and the patients.

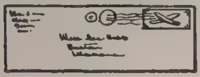
Of the average 9,000-10,000 patients seen each year by the dietitians, 2,200 are diabetics.

The facilities of the Nutrition Clinic are available to any persons referred for dietary advice by a physician in any one of the clinics in the Out-Patient Department.

Approximately 235-250 food budgets are planned each year at the request of Social Service and submitted to the various welfare organizations.

Posters, exhibits, and take-home pamphlets, emphasizing the normal diet and encouraging well-balanced meals, are arranged by the dietetic interns and displayed in prominent places throughout the Out-Patient Department.

Martha D. Chase,
Ruth A. Nelson,
Clinic Dietitians



New addresses:—

Dr. George E. Donaghy (assoc. an. 1953), Faulkner Hospital, Jamaica Plain, Mass.
Dr. Buford Hall (*M.* 1946), 273 South Limestone St., Lexington 4, Ky.
Dr. George H. Jackson, Jr. (*Or.* 1919), 855 Hinman Ave., Evanston, Ill.
Dr. William F. Ketchum (*C.M.* 1948), 501 Boylston St., Boston, Mass.
Dr. J. Drennan Lowell (a.r.s. *Or.* 1953), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Lt. Col. Frank A. Mantz, Jr., MC, USAR (res. fel. *Path.* 1950), Officers' Mail Section, Fitzsimons Army Hospital, Denver 8, Colo.
Dr. Isaac M. Taylor (*M.* 1946), North Carolina Memorial Hospital, Chapel Hill, N. C.
Dr. John L. Watson (r.s. *U.* 1930), 4010 N.W. 7th Ave., Miami, Fla.

Brief bits:—

Dr. Earle M. Chapman gave a lecture in the Isotopes in Medicine Course at the Oak Ridge Institute of Nuclear Studies, on September 22. His subject was "The treatment of hyperthyroidism with I^{131}".

Lt. Lincoln D. Clark, MC, USAR (*M.* 1948) has sent us a card from Wurzburg, Germany, giving his new military address as 10th Field Hospital, APO 800, c/o Postmaster, New York, N. Y. His card also announces the arrival of a brand new daughter — Linda Stone Clark — on August 28.

Dr. Donald S. King has moved from Boston to Hanover, New Hampshire, to be Consultant in Chest Diseases at the Hitchcock Clinic.

Dr. Robert R. Linton was elected vice president of the International Society of Angiology, at Lisbon, Portugal, on September 18. Dr. Linton read a paper there on September 20. His subject was "The surgical treatment of the postthrombotic syndrome with ulceration".

Dr. Patricia A. McIntyre (*M.* 1953) is at present an assistant resident in Medicine at the Johns Hopkins Hospital, Baltimore 5, Md.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Werner Mueller, Director of the Mosher Laboratory, traveled to Chicago in October to administer the National Board Examinations in Otolaryngology. Dr. Daniel E. M. Martinez and Dr. Yunis M. Saeed, residents at the Infirmary, were members of the group taking the examinations.

The Infirmary has welcomed several new members to its staff.

Mrs. Virginia Jarvis arrived on October 13 to begin her new duties as a histological technician in the Mosher Laboratory. Prior to her appointment here, Mrs. Jarvis served as a histological technician at the Salem Hospital and in the Mallory Laboratory at the Boston City Hospital.

Three new doctors have started their residencies at the Infirmary. Dr. S. J. Bullington has joined the ophthalmological staff, and Drs. Alfred L. Hurst and Louis Griffey have begun their residencies in otolaryngology.

Dr. George Nager, who has spent the past two and a half years in the United States taking postgraduate courses in otolaryngology, has returned to his home in Zurich, Switzerland, after his most recent study here at the Infirmary. With him was his wife, Mathilde, also an otolaryngologist. Dr. Nager is the son of Dr. Felix Nager, retired Professor of Otolaryngology at the University of Zurich. The elder Dr. Nager is known internationally as one of the leading physicians in ear, nose, and throat medicine. He is one of the founders of the Collegium Otolaryngologico.

Dr. Anthony Zovickian and Dr. John E. Regan have been appointed Graduate Assistants in Otolaryngology. Dr. Zovickian comes to the Infirmary from Johns Hopkins, where he specialized in reconstructive plastic surgery of the head and neck. He will join our plastic surgery service, under Dr. Edgar M. Holmes.

Dr. James C. Appleton began his duties as Anesthesiologist on September 26. Dr. Appleton received his Bachelor of Arts degree from Miami University and his Doctor of Medicine degree from the University of Louisville. He interned at the Springfield City Hospital.

During World War II, Dr. Appleton served as a lieutenant in the United States Naval Reserve, and was called to active duty in Saipan as Chief of the Dependents' Service. Immediately after the war, he was in private practice until he began his residencies in anesthesiology at the V.A. Hospital in McKinney, Texas, and at the Massachusetts General Hospital under Dr. Henry K. Beecher.

Prior to his recent appointment at the Infirmary, Dr. Appleton practised anesthesiology in Dayton, Ohio.

The New England Oto-Laryngological Society will meet here at the Infirmary on November 18. The program, which starts at 11 A.M. and continues throughout the afternoon, will be conducted in the upper OPD Amphitheatre.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The omission of the classification of material has constantly caused your editor considerable time and trouble. This month only two people omitted their classifications—the best record, to date. PLEASE REMEMBER TO INCLUDE THAT INFORMATION. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

All requests for reprints are to go to the individual authors and not to Treadwell Library nor to THE NEWS.

The following new titles have been received:

Dermatology

Swartz, J. H.
Actinomycosis.
In Therapeutics in Internal Medicine, 2d edition, Franklin Keyser (Editor), New York, Paul B. Hoeber, pp. 134-147.

Swartz, J. H., with Coolidge, M. H.
Kontrastfarbung fur Pilze in Hautschuppen, Nageln und Haaren.
Hautarzt 2:61-63.

General Medicine

Fromer, J. L., and Burrage, W.S.
Ragweed oil dermatitis.
J. Allergy 24:425-433.

Irwin, J. W., and Burrage, W. S.
Effects of cortisone and corticotropin on allergic reactions.
Postgrad. Med. 14:262-267.

General Surgery

Linton, R. R.
The emergency and definitive treatment of bleeding esophageal varices.
Gastroenterology 24:1-9.

Linton, R. R.
The surgical treatment of bleeding esophageal varices secondary to cirrhosis of the liver and Banti's syndrome.
Cincinnati J. Med. 34:197-205.

Linton, R. R., and Warren, R.
The emergency treatment of massive bleeding from esophageal varices by transesophageal suture of these vessels at the time of acute hemorrhage.
Surgery 33:243-255.

Laboratory Science

Montagnani, C. A., and Simeone, F. A.
Observations on the liberation and elimination of myohemoglobin and of hemoglobin after release of muscle ischemia.
Surgery 34:169-185.

Morgan, W. S.
Cytological studies of the acinar cells of the pancreas of the mouse. Part I. The formation of neutral red granules.
Quart. J. Microscop. Science 94:141-153.

Ether Day, October 16, was observed again this year with what has come to be known as the Service Pin Ceremonies.

After a few words of greeting to the assembled group of recipients and invited guests which filled the Moseley Rotunda to overflowing, Dr. Clark introduced Mr. Francis W. Hatch, a member of our Board of Trustees. Mr. Hatch brought greetings to all from the Board and then went on with what we have come to expect of him—a delightful talk woven on threads of wit and wisdom. Included in his remarks was a comparison of the M.G.H. of Morton's time with the Hospital as we know it today.

The musical part of the program followed—a brilliant rendition of Bach's Concerto No. 3 in D minor for Two Violins, with Nina Wulfe Finesinger and Wolfe Wolfinsohn as violinists, and Rowland G. H. Sturges at the piano.

Before the presentation of Service Pins, Dr. Clark reminded us that up to last year such pins had been awarded to non-professional personnel only and only to those with a minimum record of 10 years of uninterrupted service at the Hospital. Last year two additional groups were included for the first time: all non-professional workers who had served the Hospital for 5 years, and all doctors on the active staff who had served the Hospital for a continuous period of 25 years or more. This year another innovation was made: pins were awarded also to members of the Board of Consultation who, at the time of their appointment to the Board, had served for 25 years or more on the active staff.

The pins were awarded by Dr. Clark, aided in the distribution to the large 5-year group by our assistant directors. A complete list of the names of recipients was included in the program for the first time this year. Unfortunately, space limitations make it impossible to repeat those names here, but the following figures show the numbers of recipients in each group:

Non-professional

5 years—134
10 years— 57
20 years— 7
30 years— 1—Katherine H. Emerson
40 years— 2—Mary A. Dacey
Patrick J. Kilcoyne

Professional

25 years—18
30 years—14

Refreshments were served in the East Dining Room after the ceremonies.

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

The fall meeting of the MGH Staff Wives Hospital Committee took place at Walcott House on Wednesday morning, October 21. Dr. Harriet L. Hardy, Associate Physician, addressed the meeting on "The relationship of the M.G.H. to the study of occupational diseases".

The first tea of this season for visitors to the M.G.H. from abroad will be held in the Medical Staff Room of the Bulfinch Building on Thursday, November 12, from 4:30 to 6 P.M.

An increasing number of these visitors have been invited to the homes of our Staff since the commencement of our hospitality program. Becoming better acquainted with one another has proved to be a most enjoyable experience for everyone.

Mrs. Abraham L. Finesinger, Chairman of the Music Committee, has already begun this year's program of concerts in the Chapel for patients. The October 22d program presented Miss Hope Wright, viola soloist with piano accompaniment, and a string quartet. On November 4 Mrs. Helen H. Cushing gave an organ recital, and on December 9 there will be a Chamber Music Concert.

The response to these programs has been most enthusiastic on the part of both the audience and the performers. We are counting on many more concerts.

THE SUMMER SCHOOL
OF PASTORAL CARE

July 13—August 21, 1953

Groups of clergymen come to study at our Hospital each summer. One reason for this is that the Massachusetts General is a teaching hospital where, during a 12-month period, some 26 different student groups join our staff of those who are striving to learn as we serve. Ours is a closely organized world where the sick and the well learn more clearly through the ministry of illness what life is really like.

Down a hallway on Moseley 2 is a little sign which reads: Protestant Chaplain's Office. Here, in this room, the Reverend James H. Burns, Protestant Chaplain to the Massachusetts General Hospital and Executive Secretary of the Institute of Pastoral Care, trains theological students and ordained ministers in the art of ministering to people. Fifteen ministers attended the course during July and August this past summer. The group included men from 9 different States and represented 8 denominations. Five of the clergymen are serving as chaplains in general hospitals and mental institutions, 8 are parish ministers, 1 is a writer in the field of counseling, and 1 a professor in a theological seminary. The youngest person in the group was 34, the oldest 59. All were experienced clergymen yet all were students, eager for a chance to learn how to bring a more truly helpful ministry to their people.

The clergy are in the Hospital 8 hours a day, 5 days a week, for 6 weeks. They begin their training each summer by exchanging their clerical garbs for the white coats of hospital aides. For the first two weeks they serve as part-time volunteer helpers, learning such skills as how to give a patient that comforting service—a back rub. At first they are very conscious of the newness of the situation. Their unfamiliar role is as awkward to them as the starch in their coats; but two weeks of working along beside experienced male hospital aides, added to the discipline of writing reports on each day's activities, gives the men a feeling of confidence and sharpens their astuteness as sympathetic observers of people. The lowly bedpan can teach a great deal! The Admitting Office, Social Service Department, Nursing Service, and the Administrative branch of the Hospital also help to orient them during these first two weeks.

Their orientation period over, they exchange their white coats for the gray coats of a chaplain. In a ceremony of dedication they take their silver crosses from the altar of the Chapel, and pin them on one another as a symbol of their mutual support and fellowship. They are then ready for their four weeks of work as hospital chaplains. In their daily calls on patients they are accepted as representatives of religion. Each chaplain is assigned a definite floor or ward in the Hospital as his "parish". Each day he makes his rounds. Some calls last only three or four minutes and some may extend to twenty minutes. In every case he is conscious of his special pastoral role in the presence of illness. Body and mind are never separated in sickness, and very frequently what appears to be only a physical ailment has deeper emotional roots. Chaplains find that an illness of the body may be a symptom of an emotional problem that only understanding and guidance can heal.

Each day the clergyman writes a confidential report on one of the several calls he has made, giving an account of his conversation with the patient exactly as it took place. This direct report of the pastoral call is prefaced by a summary of the patient's condition and general background, the particular purpose of the call, and what the chaplain did by way of spiritual preparation beforehand. In the conclusion he evaluates the call and considers the important responses of the patient, what the chaplain might have done better, and the leads to follow in another call. As soon as the report is submitted, one of the supervisory staff reads the notes and writes instructive comments on a margin of the paper. This is the heart of the clinical pastoral training program. Not only does the note-writing enable the chaplain to have a cumulative record of the patient's progress, but it also enables him to work out his own feelings concerning the problem, helps him to see his mistakes, and renders him a more secure and confident person when he visits this same patient again, or later when he visits someone else in the Hospital or in his own parish.

The face-to-face interview draws the chaplain and the patient into a basic spiritual relationship. Therefore, the fundamental preparation for the ministry to the sick is prayer. In addition to daily group devotions the individual chaplain often spends time in the Chapel before he visits a patient who is facing a crisis in his life. Many patients ask that the chaplains pray with and for them, which they do, both as individuals and as a group. Sometimes one or two patients will visit the Chapel with their chaplain for a private service.

The students have ready access to Chaplain Burns, their Supervisor, to talk over both the reports on their pastoral calls and new possibilities for helping patients. These conversations often result in sharing other personal and professional ideas.

As the calling on patients proceeds, lectures are planned to illuminate the situations the chaplains meet. Lectures during the six weeks include such subjects as "Cancer", "Religion and Psychiatry", "Alcoholism", "The skin patient", "Understanding the menopause", "The minister's use of social agencies", "Ethical problems of counseling", and "What the church expects of its minister". Many of these lectures are given by members of the regular professional staff of the Massachusetts General Hospital. Opportunity is given for general group discussion of the issues arising from these studies, with particular reference to the problems of the parish minister. These general discussions are supplemented by smaller, more intimate weekly meetings, where the students are given more time to discuss their own emotions. Here the student takes hold of the raw material of his own experience and, by using his own feelings and his reactions to others in the group as source material, learns what it means to accept the reactions of others.

One clergyman spontaneously wrote as follows, "Quite factually, for the first time 'Life' has become my laboratory—the orderly service; the observations of autopsy, anesthesia, surgery, of films of a delivery, of mentally and emotionally upset patients; the surgical grand rounds; the medical grand rounds; the esophageal voice class; the group seminars; the lectures by doctors, hospital administrators, social workers, and nurses—all of these activities were centered in and focused upon *persons*. The key and core of it all is *personality*—what happens to persons; how they feel toward the event; how they relate it to their total experience—past, present, and future; and what they will make of it—all of this has constituted the critical question and shaped the ultimate decisions. I find that I have moved from a theological orientation in religion to a person-centered orientation."

Clinical Pastoral Training is this meeting of one personality with another in such a way that both are helped to see and feel the love of God that is present in every man, woman, and child—sometimes concealed, but always waiting to be released.

Rev. James H. Burns,
Protestant Chaplain
to the Massachusetts General Hospital

BIOGLETS

Dr. Joseph Stokes, III, Resident in Medicine—born in Philadelphia, Pennsylvania, December 2, 1924; Haverford College, 1942-44; Research Fellow, Department of Physiology, Harvard Medical School, 1945-47; M.D., Harvard Medical School, 1949; Medical Intern and Assistant Resident, Johns Hopkins Hospital, 1949-51; Senior Assistant Surgeon, U.S. Public Health Service, helping in an epidemiologic study of heart disease, in Framingham, Massachusetts, 1951-53; home: Framingham, Massachusetts.

Dr. Frederick S. Tomchik, Assistant Resident in Radiology—born in Bridgeport, Connecticut, May 2, 1920; attended University of Bridgeport and University of Connecticut; M.D., Harvard Medical School, 1951; Intern in Medicine, New Haven Hospital, 1951-52; Intern in Surgery, New Haven Hospital, 1952; married; home: Fairfield, Connecticut.

Dr. George D. Zuidema, Intern in Surgery—born in Holland, Michigan, March 8, 1928; A.B., Hope College, Holland, Michigan, 1949; M.D., Johns Hopkins University Medical School, 1953; married; home: Holland, Michigan.

In our September issue we reported that Dr. Michael E. De Bakey, Professor of Surgery at Baylor University College of Medicine, had been Acting Chief in our General Surgical Services from June 16 to July 1. After his return to Houston, Dr. De Bakey not only subscribed to The News, but he sent this very nice letter to Dr. Clark which we feel every MGH-er will enjoy reading.

> I should like again to express my grateful appreciation to you and to all your associates who contributed so much to the pleasure of my recent visit at the M.G.H. I can truthfully say that it was one of the most delightful experiences I have ever had.
>
> I am, of course, deeply appreciative of the implicit honor of this visit, but I cherish even more the warm reception extended me and the stimulating professional associations provided me during my stay at the hospital. While I had long admired the traditional medical strength of the M.G.H., I had never fully appreciated the underlying basis for it. I believe now that I have gained a much better understanding of it through my observations on the surgical service where it is so well exemplified. Actually, it consists simply in the careful blending of the three major factors which constitute good medicine, i.e., clinical care, research, and education. The formula is simple enough, but the manner in which it is applied and the selection and utilization of the highest quality personnel to apply it provide the key to success in the use of this formula. It was not only a pleasure but a real stimulus to observe how well this had been done by Dr. Churchill. He has provided a superb degree of leadership in this regard. The house officer staff is the best I have ever observed, but even more impressive is the quality of his junior full-time staff. I believe these men constitute the finest array of surgical talent I have yet seen in a single surgical service. If the future of surgery rests on the shoulders of these men, it is bright indeed.
>
> You have every reason to take pride in your great institution, and I shall always take pride in the opportunity you and Dr. Churchill provided me to be a part of it even for such a short time. Please express to all your associates my sincere and grateful appreciation for their many kindnesses and the generous hospitality extended to me.

A letter from another "singleton". In case you may be a new-comer at the Hospital, an explanation of that title "singleton" is in order. A few months ago we sent out letters to every doctor who was at that time the only MGH-er in his particular area and from whom we had received no word for a long time. We asked for information concerning their professional and social activities, and for anything in the way of interesting local color. Several long and engaging replies have been received and published in previous issues of The News. Now, here is another. It comes from Dr. William M. Shedden (*E.S.* 1920), Chief of the Surgical Service at the Veterans Administration Hospital in Lake City, Florida. He writes:

> I head up a surgical staff here in a Veterans Administration Hospital of 378 beds, of which 172 are surgical. The surgical staff numbers ten. The men on my staff are recent surgical ex-residents who are working toward examination for the American Board of Surgery. These men have been doing extremely well with the examinations. After about two years in this

No. 43 in a series of Staff photographs
Dr. Benjamin Castleman—Chief, Department of Pathology

Hospital they either enter private practice or transfer to positions in other Veterans Administration Hospitals. We have a fairly rapid turnover of cases and the men are trained to do some pretty difficult surgery. Recently one of my staff was offered the position of Chief Surgeon at the Veterans Administration Hospital in Augusta, Georgia.

At the present time our surgical staff is complete, but if any MGH-ers are interested I would be glad to hear from them, as sometimes an opening occurs unexpectedly. At the present time there are two openings on the Medical Service. If you know of anyone who is interested I suggest that he communicate at once with the Chief, Professional Services, Veterans Administration Hospital, Lake City.

Congress has allocated four and a half million dollars for the construction of a new four-story building here. It has been under construction for two months and the walls are beginning to rise. It will contain a number of modern innovations and will give me four new operating rooms.

Lake City is a beautiful little town of about eight thousand, situated among many lakes and about sixty miles from Jacksonville. We are in the northern part of Florida and may have quite marked seasonal changes. The fishing, I am told, is excellent. Some of us have little beach houses at Jacksonville Beach where we can go for week ends. We have a fine little 9-hole golf course which I have tested to my satisfaction. The townspeople are very friendly and there is an active little country club which is enjoyed by our staff.

You may have surmised from the above that I am enamored of Lake City. I am.

An extra dividend—a reply to our "singleton" letter from Dr. Edward V. Johnston (*W.S.* 1947) who, as his letter explains, is not the only MGH-er in his town. He writes:

I am always happy to have a letter from the M.G.H. because of the intense feeling of admiration and pride I feel for that institution.

My news report on personal activities must first correct one fact. The address you have is my parents' home. My current address is 1404 Fourth Street, S.E., Rochester, Minnesota. This may well affect interest in any personal news, as I am in my fourth year as a surgical resident, or "Fellowship", as it is called here at the Mayo Clinic. However, should you still be interested in news from former MGH-ers who are in training elsewhere, the following is offered. [Of course we are. Once an MGH-er, always an MGH-er.—*Editor*]

I spent a year obtaining an M.S. degree in anatomy at Northwestern University Medical School, with Dr. B. J. Anson. I have been at the Mayo Clinic since July 1950. I have been secretary, and now president, of the Fellows' Association (500 strong), and was elected to Sigma Xi this year.

Photography has waned on my hobby horizon, and I am now a full-fledged hifidelity fan. My den abounds in speakers and gadgets. I had the pleasure of entertaining Dr. George Nardi with some ear-shattering music when he visited here two years ago. I was also fortunate enough to see Dr. Castleman and Dr. Richard Sweet on their visits here during the past year or so.

My warmest regards to the MGH family.

This letter has come from Dr. John H. Peters (*W.M.* 1943):

I have delayed renewing my subscription to The News in order to be able to say a little about my new location. On the first of July I left Pittsburgh to become Assistant Chief of Medicine and Director of Medical Research at the U.S. Veterans Hospital here in Atlanta. The position is a fine one, working with a splendid group of people, although the title would seem to imply a good deal more eminence than is actually the case.

For a city of this size the number of MGH alumni is small, perhaps because of the tremendous influx in the middle 1940's from another Harvard hospital which shall be nameless.

The fact that the deep south is not proving to be as alien as might be expected is undoubtedly due to the high standards of medical and academic performance which prevail in the medical school community.

This letter has come from Dr. Richard W. Garrity (sr. r.s. *N.S.* 1950), Chief of Neurological Surgery at the U.S. Naval Hospital, San Diego 34, California:

Apropos of your note about a note from former MGH people, may I state that it has been our pleasure here to have two former staff members who have been praised by doctors, nurses, corpsmen, and patients on innumerable occasions. They are Drs. Bill Richardson (*W.S.* 1945) and John Kennedy (*S.* 1950). We sincerely hope they enjoyed their time here almost as much as we enjoyed having them.

I would like to send along my best wishes to all the old friends in the M.G.H. and to express my opinion about how pleasant and invigorating was my tour in that wonderful institution.

* * *

LET'S ALL SING!

A cordial invitation was extended to the entire Hospital family—professional and nonprofessional—to come to the meetings of the M.G.H. Glee Club, the first of which was held in the Lower O.P.D. Amphitheatre on Wednesday evening, November 4, from 7:30 to 9 o'clock.

No tryouts! No rehearsals! No dues! Just a good time for everyone who likes to sing for the sheer joy of singing.

Miss Margot Warner will direct the Glee Club. Meetings are scheduled for the first and third Wednesdays of each month.

Refreshments will be served at the conclusion of each meeting.

Watch for further notices, but in the meantime reserve these particular Wednesday evenings for the Glee Club.

THE NEWS

No. 129 Boston, Mass. December 1953

DR. FRITZ LIPMANN — 1953 NOBEL PRIZE RECIPIENT

On October 22 came the announcement that Dr. Fritz Lipmann, our Biochemist in Research Chemistry, had been awarded the 1953 Nobel Prize in Medicine and Physiology.

The honor received by Dr. Lipmann is richly deserved. All of us at the Massachusetts General Hospital and the Harvard Medical School join in congratulating him and in expressing our pride in being associated with him. Dr. Lipmann's magnificent accomplishment amply justifies the confidence the Staff and the Trustees have long had in him, and also illustrates the Hospital's far-sighted wisdom in supporting a broad program of basic scientific research.

All the best to you, Fritz!

ean A. Clark, M.D.] D. A. C.

Articles featuring Dr. Lipmann's professional career appeared in leading newspapers from coast to coast when the award was announced, and the following release was issued by Harvard University:

BIOGRAPHY OF FRITZ LIPMANN

Dr. Fritz Lipmann is Professor of Biological Chemistry of Harvard Medical School at the Massachusetts General Hospital and Biochemist-Head of the Biochemical Research Laboratory of the Massachusetts General Hospital. He has been working in the research laboratories of M.G.H. since 1941, and has been on the research staff of Harvard since 1944.

A native of Germany, he earlier had worked in laboratories in Berlin and Copenhagen and, in the United States, at the Rockefeller Institute for Medical Research and Cornell University.

Dr. Lipmann has devoted much of his career to studying the mechanisms of biosynthesis: how the body builds and renews itself out of the basic factors in food. It was recognized that this building process required large amounts of energy, but it was not known how this energy was made available.

In 1941, while working at Cornell, Dr. Lipmann had proposed the concept of a "metabolic dynamo" by which energy-rich phosphate bonds continuously supplied the needed energy for the building process. As an outgrowth of this work came the discovery of coenzyme A—now recognized as a key substance in biosynthesis.

In 1945, Dr. Lipmann isolated and identified this new factor—coenzyme A—as a crutial element in providing useable energy for the building process, in part by converting phosphate bond energy into other useful forms of chemical energy. Later he and his Harvard co-workers at M.G.H. showed how coenzyme A brings forth the construction of large units, such as fatty acids and steroids, necessary to the body's renewal and growth. In his work, Dr. Lipmann was assisted principally by Dr. Nathan O. Kaplan (now of the Johns Hopkins University), Dr. G. David Novelli (now of Western Reserve University), Dr. John D. Gregory of Harvard and M.G.H., and Dr. Morris Soodak of M.G.H.

Recently, Dr. Lipmann has been investigating the mode of action of the thyroid hormone. This hormone had long been recognized as a regulator of energy utilization. His studies have now opened an approach to a chemical understanding of its working mechanisms, in particular of its toxic effects as manifested in hyperthyroid conditions.

Now 54, Dr. Lipmann was born in Koenigsberg, Germany, and received the M.D. degree from Berlin in 1922 and the Ph.D. in Chemistry from Berlin in 1927. From 1927 to 1931 he worked as a research assistant in Berlin under two famous chemists, Otto Meyerhof and Albert Fischer. In 1931-32 he came on a fellowship to work at the Rockefeller Institute for Medical Research in New York under Dr. P. A. Levene. In 1932 he returned to Europe to work as an investigator in the Biological Institute of the Carlsberg Laboratories in Copenhagen.

Dr. Lipmann had intended to return to his native country, Germany, but the advent of the Hitler regime found him unacceptable. He, therefore, continued to work on in Copenhagen until he immigrated to this country in 1939.

Back once again in New York he found a temporary position in the Department of Biological Chemistry at Cornell University. There, Dr. Ernst Oppenheimer of the Ciba Pharmaceutical Company heard of him and became interested in his work. Professor A. Baird Hastings, Head of the Department of Biochemistry at the Harvard Medical School, also became interested in him, and both recommended him to the Massachusetts General Hospital.

In July of 1941 Dr. Lipmann started his career as Research Chemist at the Massachusetts General Hospital, the Ciba Company offering the initial financial support. Subsequently his investigations have been supported by many others, including the U. S. Public Health Service, the Commonwealth Fund, and the Rockefeller Foundation. From a start as Research Fellow in the Department of Surgery, he has become the Chief of the Biochemical Research Laboratories of the Hospital.

He became a research fellow of the Harvard Medical School in 1944. He was promoted to Associate in Biological Chemistry in 1946 and in 1949 he became Harvard's Professor of Biological Chemistry at the Massachusetts General Hospital.

In 1947 he received the Honorary Degree of M.D. from the University of Marseilles and this past June the University of Chicago awarded him the Honorary Degree of Doctor of Science.

His wife is the former Freda M. Hall of Defiance, Ohio, and they have an eight-year-old son, Stephen Hall Lipmann. The Lipmanns live at 100 Revere Street, Boston.

Our May 1953 issue of THE NEWS was honored with an article by Dr. Lipmann in which he described his work in "developing and mapping a relatively new field of biochemical research concerned with the synthesis of body material — the study of biosynthetic mechanisms", his current interest in the new field of hormone biochemistry, and his hopes for a closer affiliation in the future between the biochemist and the clinical investigator.

A few copies of this issue are still available in the office of THE NEWS for anyone who might like to procure a collector's item.

Miss Ruth Sleeper, Director of our School of Nursing and Nursing Service, has been appointed to the Health Resources Advisory Committee of the Office of Defense Mobilization.

BLOOD BANK—DONORS NEEDED

During recent years the Blood Bank has been faced with increasing difficulties in keeping a sufficient blood supply in the Bank. This shortage has resulted in cancellation of operations and in other inconveniences to the clinical staff. The main reason for the shortage of blood supply has been that an increasing number of our patients are having their blood use replaced by the Red Cross on a unit for unit basis.

This arrangement has, to a large extent, made it impossible for the Blood Bank to obtain a surplus of blood which can be used to take care of the blood needs of patients who are not able to replace blood drawn from the bank.

The extra blood need has been met by a heavy draining of our professional donors and therefore the supply from this source has been exhausted at times, particularly as far as special blood types are concerned.

We feel it would be very helpful for the Blood Bank, in its effort to keep a sufficient supply of blood on hand at all times, if the clinical staff would ask the patients who can be expected to require blood during their stay in the Hospital to bring in donors before or when they are admitted.

Our efforts to obtain more blood would be greatly helped if, in particular, a larger percentage of private patients brought in donors. This will work to their advantage both in avoiding delay in surgery and in sparing them the expense of professional blood.

It should be explained that every unit of blood which has been donated to the Bank in advance and is not used by the patient during the admission may be used to erase the laboratory and administration charges for blood received by the patient, or be kept on record in the Bank as a personal blood credit to the patient for three months.

Morten Grove-Rasmussen, M.D.,
Director, Blood Bank
Dean A. Clark, M.D.,
General Director

MASSACHUSETTS EYE & EAR INFIRMARY

The regular fall meeting of the New England Oto-Laryngological Society was held on November 18 in the upper Amphitheatre of the Massachusetts General Hospital. The morning clinical conference, led by Dr. LeRoy A. Schall, was followed by the regular afternoon meeting, with Dr. John A. Murtagh presiding.

Dr. Daniel Cunning of New York City was the guest speaker. His subject was "Errors in Otolaryngology". Other speakers included Mrs. Paul A. Doehler — "A new voice", Dr. Werner Mueller — "Hearing aids: An office problem", and Dr. George F. Reed — "Ventricule-mastoidostomy: Its significance to the otologist". The last three speakers are members of the staff at the Infirmary.

The 414th meeting of the New England Ophthalmological Society was also held at the Infirmary on November 18, with an operating clinic in the morning and a presentation of cases by Dr. Peter Beck in the afternoon. Speeches included "Discussion and demonstration of microscopy of the fundus" by Dr. Joseph J. Lo-Presti, "The pathology of the retinopathy of prematurity" by Dr. Parker Heath, and "The fixation of corneal grafts" by Dr. Brendan D. Leahey. All these speakers are members of our staff.

Dr. John R. Richardson of the Otolaryngology staff, participated in a symposium on "Tonsillectomy — Yes or no?", held at the Statler Hotel in Boston on November 4. The symposium was a part of the New England Postgraduate Assembly program.

Drs. Daniel E. M. Martinez, Yunis M. Sa'eed, Morris Sherman, and N. Edward Nachlas were among the candidates who successfully passed the National Board examinations in Otolaryngology, given in Chicago last October.

MYASTHENIA GRAVIS CLINIC

A full report of the history and purpose of this special clinic within the Department of Neurology appeared in the July and August 1948 issue of The News, admirably presented by Dr. Henry R. Viets. In 1951 Dr. Viets retired from active clinical teaching in the Hospital and the clinic was taken over by Dr. Robert S. Schwab who had been associated with him in myasthenia gravis research since 1935.

In brief summary for those who cannot obtain the old No. 70 copy of The News, the clinic began in the Neurological Out-Patient Department in 1935 and has continued unbroken up to the present time. During some years it was held at least once a month, and in others, weekly. It is estimated that in the past 18 years nearly 500 patients with myasthenia gravis have been seen in the clinic or privately by those attached to the clinic and whose records are available for study. This means that an average of 30 new cases of myasthenia gravis are seen each year by the group at the Massachusetts General Hospital. The history of myasthenia gravis at this Hospital, where the first case diagnosed was studied in 1905, reveals that the incidence in the 30 years up to the opening of the special clinic was about one case a year. The development of the special test for myasthenia gravis, using the drug Neostigmine intramuscularly to neutralize, in a few minutes, the symptoms and thereby establish the presence of the disease, was largely responsible for this increase in the number of patients encountered.

This test was worked out in the clinic and first described in 1935 in the *New England Journal of Medicine*. Failure of Neostigmine to benefit any other neurological disorder provided the necessary accuracy for a clinical test. The large number of patients encountered in this clinic has led some neurologists in other parts of the country, such as the Middle West, to suppose that the disease is geographically restricted to the eastern seaboard. The rapid growth to 200 cases of a similar clinic in Indianapolis, under the direction of Dr. Tether, has shown that these patients are common enough if they can be diagnosed.

It must be pointed out that approximately 3 out of every 4 patients who are referred to us to see if they have myasthenia gravis, because of fatigue, diplopia, or difficulty in swallowing, do not have this disorder. The fourth one does have myasthenia gravis and joins the clinic group. This means that our "yield" is somewhere around 25 percent and indicates the importance of physicians considering the possibility of myasthenia gravis in their patients.

An example of such a situation is as follows:

A 70-year-old, retired businessman, living in another continent, noticed suddenly, while driving his car, double vision and difficulty in fixing his eye. A month or so later he had trouble moving both eyes and there was dropping of the lids. This was much worse in the afternoon and comparatively much better in the morning. Local physicians were at a loss to explain his symptoms since he had no other trouble. He flew to a large European medical center and consulted several specialists in the course of a month's study, making most of his medical rounds in the afternoon when his symptoms were most marked. An unsatisfactory diagnosis of hemorrhage into the brain, with a hopeless outlook, was made. He sought help at another medical center but received no encouragement and returned home. By chance, a physician who saw him had been a visitor to the Myasthenia Gravis Clinic at M.G.H. two years previously and had witnessed the effect of an intramuscular injection of Neostigmine on ocular palsy (ocular myasthenia gravis). On a hunch that this might be the same condition, he gave the patient a diagnostic injection of 1.5 mg. Neostigmine. There was prompt opening of the eyes and disappearance of the ocular palsy. When the patient heard of the source of the doctor's knowledge he promptly flew 7,000 miles to Boston and was admitted to the Hospital for study. Here his condition was confirmed and oral medication adjusted so that his eyes were open most of the day.

In the clinic various types of drugs have been tested on cooperative and willing patients, in order to find better medication for this distressing disease. These include such preparations as endocrine products, thymus extract, special types of vitamin B, pantothenic acid, and many others. Newer preparations that depress the cholinesterase activity in the blood, such as TEPP and OMPA, have been assessed in a number of cases. Analogues of Neostigmine, such as Tensilon and Pyridostigmine, are under investigation at the present time.

Approximately 80 patients of our group have been subjected to thymectomy, with dramatic results in some patients and disappointing failures in others. Careful analysis of these results compared with an equal number of our patients who did not have the operation is now the subject of a report in press in the *Journal of the American Medical Association*. We have found, for example, that young females in our group have approximately twice the chance of getting better if they have thymectomy than if they do not, and about twice the chance of surviving than the control group. Older females or males and all patients who have demonstrable tumors (thymomas) seem to do just as well without the operation.

We have been able to keep about three-quarters of our patients in a reasonable state of medical remission by very careful and individual treatment. The complete disappearance of the symptoms and elimination of any need for medicine (Type A remission) is unfortunately rarely reached, even with excellent medical adjustment on Neostigmine. Therefore, these drugs which produce an excellent improvement in the patient's symptoms and allow the majority to resume their work and normal living seldom, however, reach a complete remission of the Type A. It is for this reason that we are still searching for better methods of therapy, more satisfactory drugs or combinations thereof, and encouragement from operative procedure.

It is also worth pointing out that the disease occurs in children and in adults up to the age of 80. There are far more females who develop the disease before the age of 30 (75 percent) and, interestingly enough, far more males develop the disease after the age of 50 (66 percent). The sex difference and the difference in response to thymectomy in the sexes is mentioned, as it strongly suggests that the disease is part of some yet unknown endocrine dysfunction. We hope, in the near future, to participate with the Endocrine and Medical Departments in the Hospital in a more thorough investigation of this aspect of myasthenia gravis.

Our group was active in supporting the organization of the new Myasthenia Gravis Foundation, of which Dr. Viets is the Director of the Medical Board and Dr.

Schwab is a member of the Board. Dr. William H. Timberlake is at present in the Myasthenia Gravis Clinic every Friday morning. Mrs. Sylvia Walker, from the E.E.G. Laboratory, is also present on the clinic day, to record the ergograms and grips of every patient in the clinic. In addition, special studies are carried out in the E.E.G. Laboratory as indicated. The Myasthenia Gravis Clinic staff is actively working with this large group of patients on a number of different aspects of the condition and we all hope to participate in the ultimate solution of the true pathological condition causing this disease.

Robert S. Schwab, M.D.,
Head of Myasthenia Gravis Clinic

The Board of Trustees, at their meetings on October 2 and 30, voted:

To accept the resignation of Dr. John C. Coolidge, Assistant in Psychiatry, as of September 30;

To transfer Dr. Howard Rasmussen, Third Assistant Resident in Surgery, to the position of Assistant Resident in Medicine;

To establish a temporary additional residency in Orthopedic Surgery.

To appoint:

Dr. Robert S. Bandurski as Assistant in Biochemistry;

Dr. Paul Colokathis as Assistant Resident on the Orthopedic Service, for the period October 15, 1953 through June 30, 1954;

Dr. Sharad C. Misra, Professor of Surgery at the Medical College of Lucknow, India, as Consultant in Surgery pro tempore for one year, beginning October 1;

Dr. Eric Nilsson as Senior Fellow in Anesthesia, for six months, beginning January 1, 1954;

Dr. Rosalind V. Pitt-Rivers as Visiting Biochemist, beginning September 1;

Dr. Morten Smith-Petersen as Assistant in Orthopedic Surgery, as of October 1.

At their meetings on September 30 and during October, the General Executive Committee voted:

To continue the appointment of Dr. Paul H. Painter as Clinical Fellow in Psychiatry, through December 4.

To reappoint:

Dr. Samir B. Bashour as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. John H. Lamont as Clinical Fellow in Psychiatry, for the period November 1, 1953 through June 30, 1954;

Dr. Jorge M. Martin as Clinical and Research Fellow in Medicine for one year, beginning September 9;

Dr. Patrick A. Ongley as Clinical Fellow in Medicine for one year, beginning October 1;

Dr. Stuart Ragland, Jr. as Clinical and Research Fellow in Medicine for one year, beginning October 1;

Dr. Warren B. Weil as Clinical Fellow in Medicine, for the period November 1, 1953 through April 30, 1954.

To appoint:

Dr. Charles Allard as Graduate Student Assistant in Surgery, for the period September 1 through December 31;

Dr. Yvon C. Baillargeon as Graduate Student Assistant and Clinical Fellow in Dermatology, effective October 1;

Dr. William E. Braisted as Graduate Student Assistant in Surgery, for the period October 1, 1953 through April 30, 1954;

Dr. Nicholas J. Fiumara as Graduate Student Assistant and Clinical Fellow in Dermatology, effective October 1;

David M. Geller, Ph.D. as Graduate Student Assistant in Biochemical Research, beginning September 30;

Dr. Mohd Kamal as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning October 1;

Dr. Raymond D. Manchester as Graduate Student Assistant and Clinical Fellow in Dermatology, effective as of October 1;

Dr. Angelo E. Paletto as Graduate Student Assistant in Surgery, for the period September 8, 1953 through March 15, 1954;

Janey H. Park, Ph.D. as Research Fellow in Biochemistry, effective October 22;

Dr. Vincent P. Perlo as Clinical Fellow in Neurology, for the period September 1, 1953 through June 30, 1954;

Dr. Luis D. Sepulveda as Graduate Student Assistant in Surgery, for the period September 15, 1953 through March 15, 1954;

Dr. Elbert P. Tuttle, Jr. as Clinical and Research Fellow in Medicine, beginning October 1.

The General Executive Committee also voted to appoint the following group of students as Graduate Student Assistants in Medicine, assigned to Cardiology, for one year, beginning October 1:

Dr. Benoit Angers of Canada
Dr. Dimitrios Bogiazides of Greece
Dr. Lamol Bunyaman of Thailand
Dr. Keran Chobanian of Rhode Island
Dr. Guillermo Gonzalez-Barrientos of Panama
Dr. Ernesto Lima of El Salvador
Dr. Kareem Minhas of Pakistan
Dr. Enrique Parás-Chavero of Mexico
Dr. Yvan Rouleau of Canada
Dr. Hsi-Chin Tsai of Formosa

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

The omission of the classification of material still causes your editor needless time and trouble. Two people omitted classifications last month, and only one person failed in that respect this month. IS IT TOO MUCH TO HOPE FOR A PERFECT SCORE NEXT TIME? Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
A method for quantifying the intensity of pain.
Science 118:322-324.

Cardiology

Sprague, H. B.
Modern therapy of coronary artery disease.
In M. Clin. North America 37, No. 5, Philadelphia, W. B. Saunders Company, pp. 1283-1301.

Sprague, H. B.
The price of comfort in angina pectoris.
M. Rec. & Ann. 47:481-485.

General Medicine

Jacobson, B. M.
Effects of cortisone and corticotropin on prolonged bleeding time.
A.M.A. Arch. Int. Med. 92:471-477.

Palmer, R. S., and Muench, H.
Course and prognosis of essential hypertension: Follow-up of 453 patients ten years after original series was closed.
J.A.M.A. 153:1-4.

General Surgery

Cope, O., Nardi, G. L., and Castleman, B.
Carcinoma of the parathyroid glands: 4 cases among 148 patients with hyperparathyroidism.
Ann. Surg. 138:661-671.

Kupperman, H. S., Bernstein, A., Forbes, A. P., Cope, O., and Albright, F.
Remission in Cushing's syndrome after bilateral hemiadrenalectomy.
J. Clin. Endocrinol. & Metab. 13:154-164.

Waddell, W. R., Geyer, R. P., Saslaw, I. M., and Stare, F. J.
Normal disappearance curve of emulsified fat from the blood stream and some factors which influence it.
Am. J. Physiol. 174:39-42.

Neurology, Neurosurgery, and Psychiatry

Lorenz, M.
Language as expressive behavior.
A.M.A. Arch. Neurol. & Psychiat. 70:277-285.

Zetzel, E. R.
The depressive position.
In Affective disorders, P. Greenacre, Editor, New York, International Universities Press, Inc., pp. 84-116.

Zetzel, E. R.
The dynamic basis of supervision.
Social Casework 34:143-149.

Ophthalmology

Clark, W. B., Dunphy, E. B., Irvine, S. R., Post, L. T., and Vail, D. T.
Initial treatment of acute injuries of the eye.
Bull. Am. Coll. Surgeons 38:367-374:388.

Pediatrics

Brazelton, T. B.
The pediatrician and hysteria in childhood.
Nerv. Child 10:306-313.

Brazelton, T. B., Holder, R., and Talbot, B.
Emotional aspects of rheumatic fever in children.
J. Pediat. 43:339-358.

Physiology

Irwin, J. W., and Macdonald, J., III.
Microscopic observations of the intrahepatic circulation of living guinea pigs.
Anat. Rec. 117:1-15.

Books

Means, J. H.
Doctors, people, and government.
Boston, Little, Brown and Company.

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

The first of the fall season teas for our visitors from abroad was given on Thursday, November 12, in the Medical Staff Room of the Bulfinch Building. As a gesture of hospitality and as an opportunity to meet one another, these teas have proved themselves most popular.

Patients who have attended the bimonthly concerts, held at 3 P.M. in the MGH Chapel, have enjoyed programs of great variety, expertly performed.

Concerts given during October have already been mentioned in THE NEWS. On November 4 a piano recital was given by Mr. Rowland G. H. Sturges; and on November 18 a sonata program was presented by Helen Teschner-Tas. Mrs. Tas is well known for her series of Bach recitals in New York and for performances of works written especially for her. For her concert here she used a rare old Stradivarius violin. Mr. David Bacon, pianist on the program with Mrs. Tas, is a concert artist.

The closing concert of the 1953 season will be given in the MGH Chapel at 3 o'clock on December 8, when a pre-Christmas program will be sung by the Morning Chorale, under the direction of Mrs. John J. Loud.

We hope that all Staff members who can will invite one or more of our visitors from other lands to spend some part of the Christmas and holiday season with them. Christmas time is a family time, and it is liable to be lonely for those who are away from home.

DISTAFF CLUB

The Distaff Club held its first business meeting of the fall season in the Penthouse on October 15. The meeting was opened by the Acting President, Mrs. Richard N. Kleaveland, with election of officers for the coming year. The new officers are:

Mrs. Charles E. Huggins, President
Mrs. H. Robert Dudley, Jr., Vice-President
Mrs. Charles G. Barnett, Secretary
Dr. Wilma J. Canada, Treasurer

Mrs. George D. Zuidema was hostess.

The program for the rest of 1953 follows:

November 10 — Dr. Joseph C. Aub, Physician at M.G.H., spoke on his experiences in India. The talk was given at 8 P.M., in the Penthouse.

November 20 — A Thanksgiving cake and candy sale, sponsored by members of the Club, was held in the MGH Brick Corridor, with Mrs. Carl F. Essig, Jr., acting as Chairman. The sale was held to raise funds for the Club. Each member was asked to contribute cake or candy.

December 17 — This is a tentative date for the Club's Christmas Party. Further notices will be given out concerning this event.

CORTICAL FUNCTION LABORATORY

In 1944, under the direction of Dr. Edwin M. Cole, Associate Neurologist, the Cortical Function Laboratory was set up as a part of the Neurological Service at Massachusetts General Hospital. At that time it was one of the first such units to be established in a general hospital. It began as a research project, with the object of selecting or devising a battery of psychological tests which would be useful in evaluating cortical function — that is, such functions as learning, remembering, reasoning — in patients with impairment of the central nervous system. Such an examination should provide an extensive and intensive quantitative survey of the patient's present mental capacities. Because standardized tests were to be used, various comparisons would be possible. For example, a particular patient could be compared with the general population. Because a wide variety of abilities would be sampled, an intra-individual comparison would be possible, to see whether various functions would be differentially affected by impairment. Because a detailed permanent record of test results and their interpretation was obtained, this could be used as an objective baseline for comparison with other examinations of the same patient, and the comparability of the results obtained by different examiners would be increased. Then, as case records accumulated, the test results of various groups of patients could be correlated and examined for trends or patterns which would be diagnostically valuable.

It had been postulated from the literature on the subject that the intellectual impairment of patients with organic brain damage would be demonstrated on tests of such functions as memory, or tasks such as the spontaneous application of new concepts. Tests to measure these and a variety of other functions for comparison were selected, and, after preliminary trials, a battery of tests was assembled and has been administered now to over 3,000 patients.

Empirically, from test results it has been found that the brain-damaged patient typically does poorly on tests requiring, for example, the making of new associations, the ability to be flexible in shifting from an established set, sustained attention and concentration, and speed of visual-motor response, while least impaired are those functions dependent on old learning, such as vocabulary and information. A reliable pattern established among the scores of the various tests differentiates significantly between this group and a control group.

In addition to detecting such generalized impairment, one must test for more specific impairments in localized lesions. It was noticed early in the testing program that the test pattern for patients with left temporal lesions differed from that in patients with brain tumors in other locations. This lead has been followed up with an intensive study of the test records of a group of right-handed patients with lesions of the left temporal lobe of the cerebral cortex and of another group of right-handed patients with lesions of the right temporal lobe. These findings will be reported in greater detail elsewhere; but briefly, the primary defect in intellectual functions resulting from the left temporal lesions seems to be in the manipulation of language symbols for the expression of verbal concepts, while in the right temporal lesions the striking impairment is in tests involving visual-spatial organization — that is, manipulating materials into correct relations in space. Other groups of patients with specifically localized lesions remain to be studied similarly for quantitative or qualitative diagnostic clues.

In examining patients for specific defects such as the aphasias, it is often necessary to use additional tests. In this laboratory a battery of tests for aphasia has been worked out, with the purpose of sampling language functions sufficiently extensively to detect higher level language impairment as well as the more gross defects in avenues of communication. The tests evaluate comprehension of spoken and written language at different levels of difficulty; recognition and naming from visual, auditory, and tactile cues; repetitive and automatic speech; ability to follow oral and written directions; writing spontaneously, from dictation and from copy; and spatial orientation — that is, right-left discrimination. Although these functions are seldom affected singly, the general trend of language impairment — whether it is of expression or comprehension, for example — is diagnostically helpful.

Another series of tests used, where indicated, as supplements to the main test battery are the Goldstein-Scheerer tests for sampling ability to do abstract thinking. These have been administered to each individual in a group of patients with brain injuries which resulted in aphasia. Contrary to some published reports, ability to make abstractions was not impaired in all these cases of brain damage. Instead, the results obtained were highly individualized — ability to assume an abstract attitude was not necessarily impaired, and when it was, the impairment was not demonstrated in all areas except in the most severely deteriorated patient. For one patient the sorting test would be more difficult, while others made more errors on the block design or stick tests. Correlating the type of impairment with the type, location, and extent of the lesion should be of diagnostic significance. Variability in the type of impairment according to the lesion would be consistent with the finding that in the left temporal lesions in right-handed patients a non-verbal measure of abstract thinking was unimpaired, while it was the use of words for conceptual thinking that was impaired.

More recently, projective techniques such as the Rorschach Ink Blots, the Thematic Apperception Test, and a Sentence Completion Test have been utilized when possible within the limits of time. The Rorschach technique, depicting the personality structure of the individual, reflects the alterations in personality consequent upon brain damage and is particularly useful, not only in differential diagnosis as, for example, between "organic" and "psychogenic" illness, but also in evaluating the patient's reaction to his illness. The Thematic Apperception Test and the Sentence Completion Test give clues as to the content of the patient's problem. For example, from the Rorschach it might be possible to say that anxiety is prominent in the picture and to indicate ways in which this anxiety affects other functions, while the other two techniques might suggest whether this anxiety centers around physical illness or the handling of hostility.

One current project consists of gathering test records of children with localized brain lesions and comparing the test patterns obtained from the Wechsler Intelligence Scale for Children with those obtained from adults on the Wechsler-Bellevue. From the few cases available to date, no definite conclusions can be drawn, but so far there seems to be a close relationship between the test patterns.

Periodic psychological examinations of a group of Korsakoff patients is presently being conducted, also, in association with Dr. Maurice Victor. Tests being utilized are the Wechsler-Bellevue Intelligence Scale and the Wechsler Memory Scale. Since this study is not yet completed, only certain generalizations will be presented at this time.

All of the Korsakoff patients have, in general, revealed a marked memory loss and disturbance in the formation of new associations. It is felt that the failure of association is likely to be due to an inability to combine permanently two associates. We are not certain of the brain change; however, the general effect seems to be not so much an obliteration of old as a resistance to the formation of new associations. This inability to form new associates can account in part for many oddities depicted by the Korsakoff's behavior — for example, difficulty in associating names with objects, places, etc.

The defective orientation for time, as well as the tendency toward confabulation so characteristic of the Korsakoff patient, may be explained in terms of the inability to form new associations. The patients have attempted to fill up gaps of memory, though not deliberately. We have found that the readiest association may not be entirely faulty. It is more than likely that the patient has done what he states — but when? Yesterday? three weeks ago? It is the temporal orientation that has been lost.

The use of psychological evaluation as an adjunct to neurological examinations is a relatively new trend. Its contribution is to provide a careful description of the total psychological functioning of the individual patient and to evaluate specific dysfunction. In order to make the best possible use of psychological tests and techniques as applied to neurological patients, our psychological results must be validated by checking them against anatomical and pathological findings, and other laboratory data, as is infrequently possible in a separate psychological laboratory. Shortages of time, space, and personnel have limited full use of this type of cross-checking, but this is a direction in which more progress must be made in the future.

Elizabeth E. White, M.A.

Brief bits:—

Dr. Allan M. Butler gave the Sixth John H. Musser Lecture at Tulane University School of Medicine, New Orleans, on November 6. He spoke on "Homeostatic limitations to safe parenteral fluid therapy".

Dr. Bradford Cannon presided at the Session of the Forum on Plastic Surgery, at the recent meeting of the American College of Surgeons in Chicago.

Dr. Daniel C. Dawes announces the removal of his office for the practice of Psychoanalysis and Psychiatry to 51 Brattle St., Cambridge 38, Mass.

Dr. Bernard M. Jacobson delivered a lecture before the New England Society of Oral Surgeons, at Poland Springs, on October 11. His subject was "Why the patient bleeds and what to do about it — from the point of view of the oral surgeon".

Dr. J. Gordon Scannell delivered three lectures recently. On September 23, with Dr. Gordon S. Myers, he discussed "Cardiac problems" at the meeting of the Massachusetts Academy of General Practice; on October 23, at the Veterans Administration Hospital in Rutland Heights, Massachusetts, he talked on "The physiological basis of cardiac surgery"; and on October 28, at the meeting of the New Bedford Medical Society, he gave a lecture, with Dr. Myers, on "Cardiac surgery".

Dr. William R. Waddell discussed the subject "The clinical use of emulsified fat in parenteral nutrition" at the Memorial Hospital in Worcester on October 1.

Dr. James C. White has sent us a nice long Brief Bit. He writes: "In September I took a trip to Lisbon to attend the Fifth International Congress of Neurology and, the following week, a meeting of the International Surgical Association. I talked to the Neurological Society about the studies Dr. William H. Sweet and I have made of pain conduction in the spinal cord, and on neurosurgical relief of pain in thoracic aneurysm at the symposium on blood vessels at the second meeting. Mrs. White and I were delighted to see again two former members of the MGH neurosurgical staff — Dr. David Gamsu of Johannesburg and Dr. Jean Lepoire of Nancy. Dr. Pierre Stricker, who worked at M.G.H. as the first Maurice Richardson Fellow in 1929, was there with his wife and took us back to France across northern Spain in his car. This proved to be a most delightful trip and a most efficient refresher course in the French language — so much so that I was able to give an hour's lecture in Paris to Professor David's staff at the Hôpital Ste. Anne and to discuss cases at Grand Rounds at the Pitié on the Neurosurgical Service of Professor Petit-Dutaillis. Thanks to Pan American, we had a month abroad and were gone only 32 days."

New addresses:—

Dr. Benjamin A. Barnes (*W.S.* 1945), 1180 Beacon St., Brookline 46, Mass.
Dr. William P. Boger, Jr. (a.r.p. 1942), R.D. 1, Meadow Lane, Wayne, Pa.
Dr. Bedford F. Boylston (sr. r.s. *Or.* 1950), 5215 South Main St., Houston 4, Tex.
Dr. Clyde W. Dawson (*Or.* 1936), 150 East Broad St., Columbus, Ohio.
Dr. Ira M. Dixson (*W.S.* 1930), 1601 Downing St., Denver 18, Colo.
Dr. William E. Eaton (*D.* 1907), American College of Surgeons, 40 East Erie St., Chicago 11, Ill.
Dr. Arthur B. Emmons, II (*W.S.* 1905), Brewster Drive, Bay View Estates, Indian Rocks, Fla.
Dr. Richard S. Eustis (*W.M.* 1912 & *C.M.* 1913), Hancock, N.H.
Dr. Richard A. Field (*M.* 1950), Dept. of Biochemistry, Washington University Medical School, St. Louis, Mo.
Capt. Boy Frame, MC, USAF (*M.* 1949), 73 Partridge Court, Selfridge AFB, Mich.
Dr. Elmer F. Franseen (j.r.s. *Or.* 1947), 146 Chestnut St., Springfield, Mass.
Dr. John F. Hogan (*M.* 1949 & *C.M.* 1950), 156 Broadway, Pawtucket, R.I.
Dr. Carl E. Horn (*Or.* 1940), 2901 Capitol Ave., Sacramento 16, Calif.
Dr. Frederick C. Irving (*W.S.* 1911), 2 North Pine Circle, Belleair, Clearwater, Fla.
Dr. Albert J. D. Michel (a.r.p. *An.* 1950), Chirugien à l'Hôpital St. Joseph, Lyon, France.
Dr. H. Bristol Nelson (a. obst. 1953), 711 Marina Blvd., San Francisco 23, Calif.
Dr. Richard V. Riddell (*E.S.* 1943 & *Path.* 1947), 902 Edmond St., St. Joseph, Mo.
Dr. John C. Snyder (*W.M.* 1939), Dept. of Microbiology, Harvard School of Public Health, 695 Huntington Ave., Boston, Mass.
Dr. Iwao Uyeda (*C.M.* 1950), 30 Fortuna Ave., San Francisco 15, Calif.
Lt. Charles W. Wahl, MC, USNR (clin. a. *Psychiat.* 1953), U.S. Naval Hospital, Philadelphia, Pa.
Dr. Eugene Walker (past a. dir.), 102 Cotswold Rd., Baltimore 10, Md.

The letters from "singletons" still continue to arrive. Here is a very interesting one from Dr. Edward H. Risley (*E.S.* 1908).

Your request for an *expansive* description of the life of a lone MGH-er in Waterville, Maine, might run into quite a volume if I tried to relate all the changes and vicissitudes I have been through since I came to Waterville in 1920.

Probably the most important development has been that of a new and absolutely modern and perfectly equipped hospital of 75 beds — the new Thayer Hospital, which compares favorably with the most modern and best hospitals in Boston. It has a keen and active staff and a nursing group who give it a homelike atmosphere, with all the friendliness which is so conspicuously absent in larger hospitals in big cities. I have been a patient in both kinds and I know the difference.

I am well past the retiring age, but I am still very active surgically because I have learned that *two* vacations a year are what every active physician should have in order to keep fit and fresh.

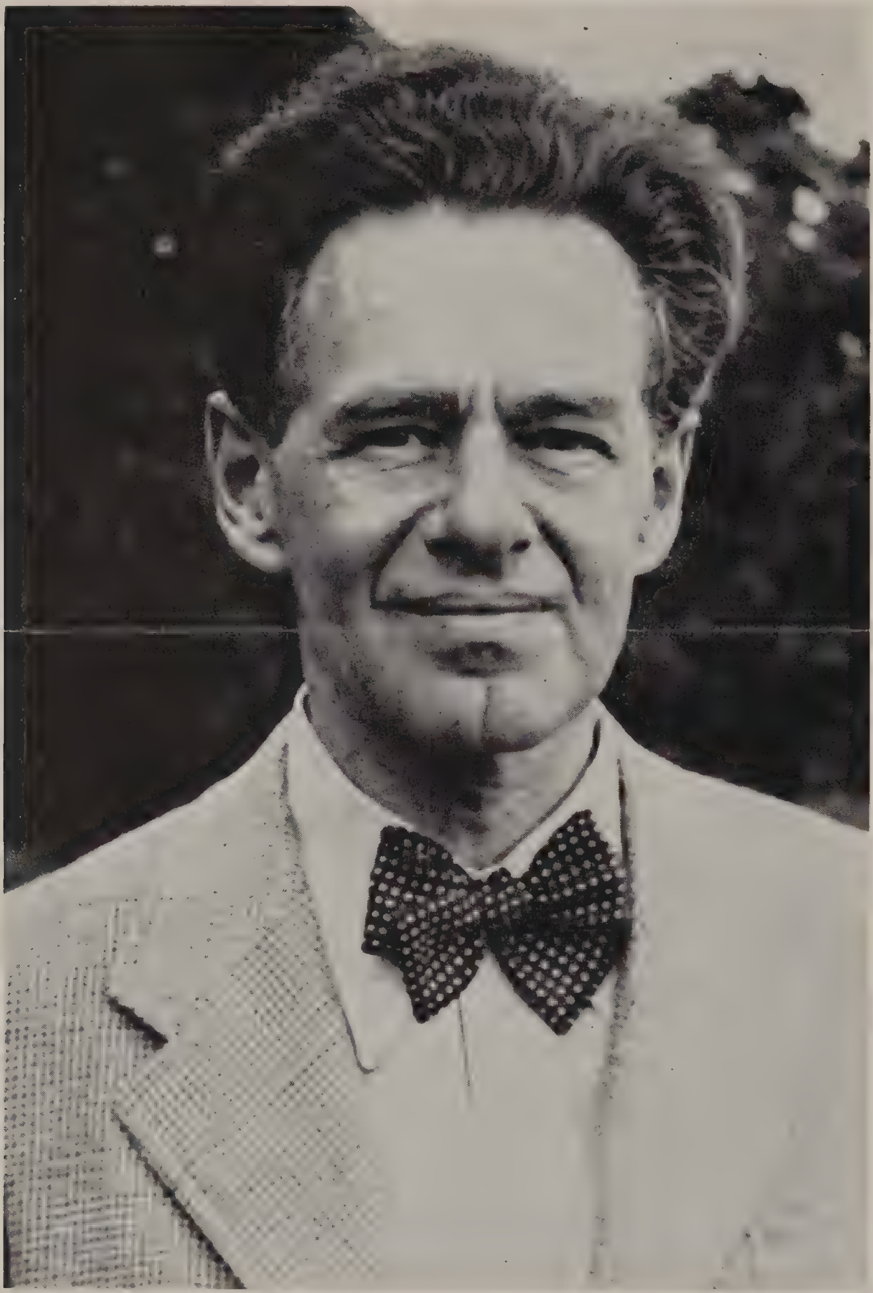
My trip last winter — flying down the west coast of South America to Lima, Peru, and Santiago, Chile, then across the Andes to Buenos Aires and Montevideo, and to Sao Paulo for the Inter-American American College of Surgeons meeting — was intensely interesting and profitable. We returned from Rio by boat in time to take in the sectional meeting of the College in Boston. When I reached home I felt I had been well educated both surgically and geographically. I take a boat trip every February to some part of the warm Caribbean.

I have a beautiful summer place on Great Pond in the Belgrade Lakes region, only 15 miles from my office, where I can relax, swim, sail, water ski, and play tennis with my friends and children.

I go to Boston frequently in order to keep in touch with surgical progress, and I come back home with the knowledge that we are as well equipped here, with our laboratory and all the aids to medical progress, as are the best hospitals in Boston. This is not boasting. It is an actual fact, due largely to the fine group of keen younger men who have come here in the past few years and who have been a definite stimulus to us older doctors. We are so well equipped with men in all branches of medicine and surgery that it is rarely necessary to refer patients to the larger centers for treatment.

A very welcome letter has come from Lt. Giles D. Toll, MC, USNR (*S.* 1952), written aboard the U.S.S. *Franklin D. Roosevelt* (CVA 42), c/o Fleet Post Office, New York, N. Y.

The News continues to be a constant source



No. 44 in a series of Staff photographs
Dr. Fritz Lipmann—Recipient of the 1953 Nobel Prize in Medicine and Physiology

of pleasure and interest, and of great help in keeping in touch with the M.G.H.

After being somewhat skeptical of the Navy's slogan about joining up and seeing the world, I have been fortunate in learning there's definitely an element of truth in it. After spending the early part of last summer in Morocco with the Sea Bees, I was transferred to the F.D.R., which is presently on a Mediterranean cruise.

Our perigrinations took us to Beirut, Lebanon, on October 23, where a small gold mine of MGH people was found at the American University. My intention in visiting there was to look up Bill Shorey, only to learn that he'd moved to Damascus about a month before. However, he has been replaced by John Wilson, of San Francisco and more recently Siam, who was most gracious in his welcome. Helping him with the nursing service is Miss French; and, by good luck, Dr. Aufranc was there that particular evening for an excellent talk on reconstructive hip surgery. The interest and enthusiasm of both the house staff and students were impressive, and gave an idea of how much Bill Waddell's visit last spring had meant to them. This brief return to an academic environment and a group of people from the "Old Massachusetts" was most refreshing.

My very best to everyone there.

* * *

Dr. Churchill called to our attention an excellent and inspiring article by Sir Harold Himsworth, in the October 17 issue of *The Lancet.* While the entire article is well worth reading, a part of the section titled "Purpose of the teaching hospital" is of particular significance to every MGH-er because of a tribute paid to Dr. Nathaniel W. Faxon, our past Director. It reads:

> . . . The National Health Service Act lays on the boards of governors [of the teaching hospitals] the duty of providing the facilities necessary for medical education and research, but does not specify the priority that should be accorded to this among their other manifold responsibilities. That there is some divergence of opinion on this point is evident. It may, therefore, interest you to know the view of one of the greatest and most successful administrators of a teaching hospital, Dr. Nathaniel Faxon of the Massachusetts General Hospital in Boston. He epitomized his considered judgment on this matter in one sentence:
>
> > "The functions of a teaching hospital are first, to advance knowledge; second, to set an example of practice; and third, to train future doctors; they are not primarily to cater for local needs."
>
> Stated in this forthright manner these opinions may seem a little startling; but, if one examines them, their inescapable logic impresses.
>
> Leaving aside, for the moment, the order of priorities he assigns to these different functions of a teaching hospital, I think that we should all agree that to advance knowledge, to set an example of practice, and to train doctors are, each and all, duties which a teaching hospital must undertake. But none of them can be discharged in any high degree without special facilities, special staff, and specially directed effort on the part of all concerned. For medical education all are required. Taken together, their demands on an institution are so exacting that they are unlikely to be met unless their full realization is taken as the primary and deliberate aim of policy to which other claims must be regarded as secondary.
>
> But let us return to the first part of this statement and examine the priorities accorded to the different functions of the teaching hospital. There is the same clear logic in the sequence given to these priorities. How can one set a high example of practice if one is not advancing knowledge? How can one train future doctors if one is not setting such an example? The motive point is research. Personally, I would go so far as to say that in the association of research with teaching we have the essence of the distinction between education and training. And it must necessarily be so if the aim of education is to liberate a man to think for himself. The crucial test of a man's understanding of a subject is his ability to advance it. If a student does not see his teachers thinking effectively how can he learn to think for himself? It is only by living and working in an atmosphere imbued with the thirst for new knowledge that a student can acquire that critical receptivity and perception on which alone he can rely when, as so often happens in medicine, established knowledge fails him. . . .

As we finished our reading of the article, an impulse to quote also the closing sentences became too strong to resist. While the words are directed especially to those in the medical profession, every one of us — whatever his vocation may be — will find here food for thought and an impetus for worth while self-examination.

> . . . More than two thousand years ago a code of conduct was laid down for the medical profession. To the fact that the spirit of this code has been faithfully observed by succeeding generations of medical men we can attribute the public trust which we have inherited. But the original code was concerned only with the relations of medical men to individuals under their care. Today medicine has acquired extensive relations with society in general. Nevertheless the spirit of the Hippocratic Oath is as relevant to medicine now as it was two thousand years ago. And what is its essence? It can be given in one sentence. *Act always so as to increase trust.* That is the first and paramount law of social ethics. In your relationship with individuals act so as to increase their trust in your professional skill and your character as a man. In your research act so as to increase confidence in scientific integrity. In public relations act so as to increase the confidence of society in your profession. With that criterion as a guide, whatever changes occur in the social context, neither the individual nor his profession need fear the future.

Professor Himsworth visited Massachusetts General in 1947, while he was in Boston to deliver his five Lowell Institute Lectures on diseases of the liver. At the request of Dr. Means, he made ward rounds on both the East and West Medical Services. His picture is in the June 1947 issue of The News.

No. 130 Boston, Mass. January 1954

PSYCHIATRIC RESEARCH
1934 — 1953

Twenty years ago we tried to define psychoneurosis (neurosis) and listed the different psychoneurotic syndromes in order of severity, the nearest to normal at the top and the nearest to schizophrenia at the bottom, as follows:

- Nervousness (exaggeration of physiological reactions)
- Anxiety neurosis
- System neurosis (psychosomatic reactions)
- Hysteria
- Depressive reactions
- Obsessive and compulsive reactions
- Hypochondriasis

At first we studied these conditions symptomatically, interesting ourselves especially in the symptoms produced by disorders of the autonomic nervous system. Interpersonal relations were also investigated by clinical interviews and charted by means of the interaction chronograph, a machine for recording the time relations of an interview between doctor and patient. In the next year respiration was studied particularly, and the effect of oxygen and sugar supply on the electroencephalogram. Microscopic examinations were made of living capillaries in cases of hysteria and anxiety neurosis. Such psychosomatic diseases as ulcerative colitis and peptic ulcer were given systematic psychiatric evaluation.

An investigation of neurocirculatory asthenia was begun along physiological and psychological lines. In 1944 these studies were continued and emphasis was put on the central nervous system. Our physiological studies of respiration, heart rate, and vasomotor phenomena showed that patients with anxiety neurosis have a greater lability and greater reactivity to stimuli than normal persons. There is no evidence that there is a disturbance in the peripheral pathways, hence we conclude that the disturbance must be in the central nervous system, especially in the higher centers which mediate the functions of the autonomic nervous system. We completed several studies, using conditioned reflexes and the electroencephalograph which support this hypothesis.

The Cocoanut Grove disaster of 1943 brought in a large group of acutely suffering and grieving persons, whose reactions then and on prolonged follow-up were clinically observed. They led to important conclusions concerning normal and abnormal grief reactions.

From 1941 to 1945 neurocirculatory asthenia and anxiety neurosis received much of our attention because they were disorders common in the armed forces. Likewise peptic ulcer, a common disease in the Army, was studied psychologically. The effect of emotional stress upon the adrenocortical hormones was examined in experimental situations.

Studies on 60 cases of peptic ulcer were brought together in 1946. Our previous experience with neurocirculatory asthenia was brought to bear on the subject of fatigue in a joint study with the Department of Physical Medicine. A new method of analyzing the brain-waves of patients with barbiturate intoxication, neurosis, and normal controls was instituted. Long range follow-up studies on patients treated for anxiety neurosis and hysteria were begun. During 1948 these studies were continued and an especial effort was made to understand the psychotherapeutic process, specifically, by studying interviews and analyzing what is said by the patient and by the doctor. For this purpose an electronic analyzer was devised which has replaced the older chronograph. In 1949 the studies on anxiety neurosis, especially the follow-up work, were concluded and reported. A group of patients with anorexia nervosa was brought together and examined clinically; old cases were followed up and added to the report.

In 1946 a paper was published on the histopathological effects of short and repeated periods of anoxia of the brain. The work which was started during the war on the psychological effects of oxygen deprivation was brought to a close in 1949. Its relation to the electroencephalogram and to the effects of anesthesia were brought out by cooperative research with the Anesthesia Department.

During 1950 and 1951 studies on language were emphasized. A paper was written on manic speech and a general review of the literature was made, to bring out the aspects of this broad study that are especially applicable to medicine. The results are being applied to patients before and after cerebral operations and before and after radiation, as well as to patients with neurosis. The cooperation with the Neurosurgical Service has given us an opportunity to study a series of patients suffering from intractable pain. This has been a valuable experience. Among the patients suffering severe pain, both relatively normal and conspicuously neurotic persons have been found. Their reactions to pain, to drugs, and to operations have been compared.

Our interest in the relation of adrenocortical hormones began in 1946 when some work was done on the effects of emotional stress, in cooperation with the Worcester Foundation for Experimental Biology. During the past two years about 70 patients have been seen on the Medical Service who were undergoing treatment with adrenocorticotropic hormones or cortisone. The psychiatric reactions of these patients have been of great interest and have been studied by a group of psychiatrists in cooperation with the arthritis and endocrine groups working in the Medical Laboratories. Four papers have been written dealing with endocrine reactions. At present a psychiatrist is assigned to work in the Thyroid Clinic and another to see all cases with adrenal and pituitary disorder. Appropriate patients are brought to the Psychiatric Ward for care and study.

An investigation of the psychological reactions of patients with coronary thrombosis has been carried on for the last three years with the cardiac group of the Medical Service. On the Children's Medical Service a study of patients with rheumatic fever has been under way and is nearing completion. Asthma and low back pain are two other conditions under investigation. All of these psychosomatic studies are dependent upon our getting patients with the desired diagnoses from the Medical Services; the work is therefore opportunistic and often has to be carried on in a piecemeal way over a period of years before an adequate number of cases have been studied. Exceptions to this were the investigations of coronary thrombosis and rheumatic fever, where large groups of cases had already been collected by the medical workers, and these groups were made available to us; the study on neurocirculatory asthenia was similarly made possible by the use of Army personnel. Rare diseases like Cushing's syndrome have come to us in large enough numbers to make a significant study possible, because of the reputation of the Endocrinology Division of the Medical Services; the same may be said of our work in ulcerative colitis, in cooperation with the Gastrointestinal Clinic. Common diseases such as arthritis, asthma, and eczema, that seem to have important psychosomatic aspects, are being investigated psychologically by one or more of our psychiatrists, usually in the Out-Patient Department or on the general wards, but certain cases are sent to the Psychiatric Ward. Thus data are being collected steadily on the "psychic" side of these "psychosomatic" problems.

Over the twenty years many changes have taken place in our attitudes and we have learned much. The diagnoses we use and the way we apply them to patients keep changing. This is hopeful, because it shows a willingness to change and admit ignorance. In the early years we thought of psychosomatic diseases as forms of neurosis expressed through the autonomic nervous system and developing lesions because of chronic malfunction. In general this concept still holds, and much evidence for the psychogenesis of lesions has been brought forward. We have learned, however, that there are two groups of psychosomatic disorders. One is made up of patients with very common but sometimes trivial nervous complaints, such as sweating, palpitation, tremor, anxiety, diarrhea, motor habits, and escape reactions. These are important because of their frequent occurrence, and are as a rule reversible with simple therapy. The other group is composed of patients with medical disorders that can be severe or even fatal, but that nevertheless have psychological factors of critical importance; the most commonly recognized are alcoholism, drug addiction, asthma, eczema, rheumatoid arthritis, peptic ulcer, and ulcerative colitis. Experience has shown that the personality deviations in this group often go beyond the bounds of neurosis and that life stress or unwise psychiatric handling may precipitate severe mental illness. Sometimes the symptoms are schizophrenic in type, or the patient may go into a deep depressive reaction. Here we have learned to proceed with caution, but also we have learned how valuable psychiatry may be to medicine in certain cases.

These investigations and our clinical experience have changed our point of view toward neurosis to some extent. We still believe that neurosis is largely caused by maladjustment in interpersonal relations, but these maladjustments occur most often in predisposed persons. The predisposition can be the result of heredity, malformation, infection, degenerative disease, or trauma. We now would classify the neuroses as follows:

Nervousness (exaggeration of physiological reactions)
Mild psychosomatic reactions
Anxiety reactions
Substitution reactions (hysteria)
Depressive reactions
Obsessive and compulsive reactions
Severe psychosomatic reactions
Hypochondriasis

Papers to the number of 234 have been published. Also, two books: *Emotions and Clinical Medicine* by Stanley Cobb, and *Case histories in Psychosomatic Medicine,* edited by Dr. Henry H. W. Miles, Dr. Stanley Cobb, and Dr. Harley C. Shands. A complete bibliography will be sent on request.

Stanley Cobb, M.D.,
Chief of Psychiatry Service

Christmas celebrations at M.G.H. began this year on December 8 and continued through the 24th. The festivities began with a concert of Christmas music given in the Chapel by the Morning Chorale, with Mrs. Mary Loud directing. This was followed by the singing of Christmas carols on the wards throughout the month by members of such groups as the Harvard Glee Club, the Winsor Glee Club, the Intervarsity Christian Fellowship, the New England Conservatory of Music, and the MGH Carolers. The Radcliffe College Bell Ringers gave a lovely program here on December 10, and the traditional and very impressive Nurses' Candlelight Service was held on December 21. Other events included the Distaff Club's Christmas Party, the Christmas Formal Dance for Student Nurses, the party for all members of the MGH family (including their wives or husbands and children), and the Children's Party held in the Burnham Memorial Hospital.

Lighted Christmas trees on the Hospital grounds, rows upon rows of wreaths outside the windows, and gayly painted scenes on walls and doors and windows within the various buildings gave a miracle-like background for the many activities which only those who have been at M.G.H. during a holiday season can fully appreciate.

* * *

The new doors in the George Robert White Building entrance of the Massachusetts General Hospital were officially opened on November 13.

A generous gift from the Nathaniel and Elizabeth P. Stevens Foundation made the construction of the doors possible. As a Trustee of the Foundation and as a member of the Corporation of the Hospital, Mr. Abbot Stevens cut the ribbon at the ceremonies which marked the occasion. Then, escorted by Dr. Dean A. Clark, he was the first to walk through the new doors.

A mere touch of a finger on the push and pull bars, or a step or the touch of a crutch on the mat operators opens a 250-pound Herculite door. Besides accommodating the usual flow of traffic in a most efficient manner, the 4 wide doors have greatly lightened up the Main Entrance room and have enhanced the appearance of the White Building, both inside and out.

New addresses:—

Dr. Samir B. Bashour (gr. stud. a. *M.* 1953), National Hospital, Aleppo, Syria.
Dr. William P. Boger (a.r.p. 1942), 640 North Broad St., Philadelphia, Pa.
Dr. Albert G. Engelbach (a.dir. 1937), c/o N.F.I.P., 915 St. Joseph St., Dallas, Tex.
Mr. Phillips Ketchum (*Trustee & Vice-President of the Corporation*), 294 Washington St., Boston, Mass.
Dr. Richard G. Nilges (r.s. *N.S.* 1951), 2717 Wabash Ave., Gary, Ind.
Dr. Maurice M. Pechet (a.r.p. 1952), National Heart Institute, National Institutes of Health, Bethesda, Md.
Dr. Traute Richter (fel. *An.* 1953), Univ.—Frauenklinik, Graz/Stmk, Austria.
Lt. John C. Rowe, MC, USAR (*M.* 1952), Medical Co., 8th U.S. Cav. Regt., APO 201, c/o Postmaster, San Francisco, Calif.
Dr. John C. Seed (*M.* 1946), Sterling Winthrop Research Institute, Rensselaer, N. Y.
Col. Milton S. Thompson, MC, USA (*Or.* 1934), 98th General Hospital, APO 34, c/o Postmaster, New York, N. Y.

MASSACHUSETTS EYE & EAR INFIRMARY

The Board of Managers of the Infirmary has voted to proceed with the construction of three new stories, built above the present OPD Connecting Building, to provide the space and equipment needed for research and teaching. Plans are expected to be completed in March, and it is hoped that construction will begin in the early spring.

The new Research Center will give us 15,000 useable square feet and will provide modern, compact laboratories for the research projects now scattered in cramped quarters throughout the Infirmary.

Dr. Earle W. Rice has completed his residency and returned to Worcester, Massachusetts, where he has begun private practice with his father and brother. Dr. Rice is the third member of the Rice family to train here at the Infirmary. Theodore was the first. He completed his residency in Ophthalmology in 1942. John left the Infirmary in 1943, having received his training in Otolaryngology.

Dr. William Patterson, from Vancouver, British Columbia, has begun his residency in Otolaryngology. Dr. Patterson comes to the Infirmary after studying at the University of British Columbia and receiving his degree at the Ottawa Medical School.

Miss Helen T. Patten, teacher in the Speech Clinic, Winthrop Foundation, was chosen to be the recipient of an award from the Executive Board of Emerson College's Women's Committee. This award was presented to Miss Patten on December 5, in recognition of her "inspiring and encouraging" help in planning and advising for the installation of the new Speech Clinic at the College.

The Samuel D. Robbins Speech Clinic, sponsored by this Women's Committee, was dedicated at exercises held at the College on December 4. With its new equipment, the Clinic will have the facilities for treating and training all cases of speech handicaps. Miss Patten has been chosen to serve on the Executive Committee of the Clinic.

Dr. Beecher tells us that an operative in Long Beach, California, informed him that *The hospital in contemporary life* has been checked out of the Public Library there eighteen times since 1949. Dr. Beecher adds: "Dr. Faxon please note."

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

YOU DID IT! AND YOUR EDITOR IS MOST GRATEFUL. For the first time since this column was started in July of 1950, not a single classification of material was omitted this month. As a result, the time required to set up your titles for the printer was appreciably reduced. Your editor thanks you.

The following new titles have been received:

Cardiology

Cohen, M. E.
The management of disturbed cardiac patients.
Mod. Concepts Cardiovas. Dis., pt. 1, 22:182-183; pt. 2, 22:186-188.

King, R. L., Jenks, J. L., Jr., and White, P. D.
The electrocardiogram of a Beluga whale.
Circulation 8:387-393.

Littmann, D., and Bland, E. F.
Some pitfalls in electrocardiography.
In M. Clin. North America 37, No. 5, Philadelphia, W. B. Saunders Company, pp. 1341-1350.

Sprague, H. B.
The clinical value of phonocardiography.
Bull. New England M. Center 15:94-96.

Sprague, H. B.
Diagnostic challenges of heart disease.
In Proceedings of the Twenty-Second Annual Postgraduate Symposium on Heart Disease, San Francisco Heart Association, pp. 218-226.

Sprague, H. B.
Pattern of the youthful coronary patient.
In Proceedings of the Twenty-Second Annual Postgraduate Symposium on Heart Disease, San Francisco Heart Association, pp. 178-186.

Sprague, H. B.
Phonocardiography.
In Proceedings of the Twenty-Second Annual Postgraduate Symposium on Heart Disease, San Francisco Heart Association, pp. 22-27.

Sprague, H. B.
Resistant congestive failure.
In Proceedings of the Twenty-Second Annual Postgraduate Symposium on Heart Disease, San Francisco Heart Association, pp. 81-90.

Sprague, H. B., and Tansey, W. A.
Fever as a sign of quinidine toxicity: Report of sensitivity in two brothers with thyroid disease.
New England J. Med. 249:796-798.

Thomas, W. A., Averill, J. H., Castleman, B., and Bland, E. F.
The significance of Aschoff bodies in the left atrial appendage: A comparison of 40 biopsies removed during mitral commissurotomy with autopsy material from 40 patients dying with fulminating rheumatic fever.
New England J. Med. 249:761-765.

White, P. D.
Principles and practice of prognosis, with particular reference to heart disease. (Billings Lecture)
J.A.M.A. 153:75-79.

White, P. D.
The range of the normal heart rate.
Am. Scholar 22:315-322.

Dermatology

Lever, W. F.
Bestimmung der Lipoproteine und Glycoproteine im Plasma von Patienten mit verschiedenen Hautkrankheiten.
Hautarzt 4:426-428.

Lever, W. F., Smith, P. A. J., and Hurley, N. A.
Effects of intravenous heparin on the plasma lipoproteins in primary hypercholesteremic xanthomatosis and idiopathic hyperlipemia.
Science 118:653-654.

General Medicine

Isselbacher, K. J., Klaus, H., and Hardy, H. L.
Asbestosis and bronchogenic carcinoma: Report of one autopsied case and review of the available literature.
Am. J. Med. 15:721-732.

Waddell, W. R., Geyer, R. P., Clarke, E., and Stare, F. J.
Role of various organs in the removal of emulsified fat from the blood stream.
Am. J. Physiol. 175:299-302.

Waddell, W. R., Van Itallie, T. B., Geyer, R. P., and Stare, F. J.
Liver function during intravenous infusion of emulsified fat to humans.
Ann. Surg. 138:734-740.

General Surgery

Kay, J. H., Harrison, T. S., and Zuidema, G. D.
The effect of sympathectomy on experimental frostbite in the dog.
Surgery 34:867-869.

Scannell, J. G., and Robbins, L. L.
X-ray examination of the chest and its surgical significance.
Ciba Clin. Sympos. 5:131-166.

Laboratory Science

Blank, I. H.
Further observations on factors which influence the water content of the stratum corneum.
J. Invest. Dermat. 21:259-271.

Blank, I. H., and Barker, F. M.
The action of hexachlorophene-detergent mixtures on the bacterial population of the cutaneous surface.
Proc. Scientif. Sec., Toilet Goods Assoc. 19:50-54.

Griesemer, R. D., Frazier, C. N., and Blank, I. H.
Nutritional influences on the physiology of the skin: Observations on the metabolism of vitamin A.
Medicine 32:293-321.

Matoltsy, A. G.
Analysis of the ultrastructure of vitrosin fibers on the basis of the polarization optical method.
Biochim. et Biophys. Acta 11:326-328.

Matoltsy, A. G.
A study of the medullary cells of the hair.
Exper. Cell Research 5:98-110.

Neurology, Neurosurgery, and Psychiatry

Barry, H., Jr., and Marshall, F. E.
Maladjustment and maternal rejection in retrolental fibroplasia.
Ment. Hyg. 36:570-580.

Physical Medicine

Watkins, A. L.
Rheumatoid arthritis in industrial medicine.
New York State J. Med. 53:2330-2334.

Miscellaneous

Garland, J.
Trends in American Medicine.
Practitioner 171:445-451.

Sleeper, R.
The Sixth World Health Assembly.
Am. J. Nursing 53:1463-1464.

Books

Klein, A., Joplin, R. J., Reidy, J. A., and Hanelin, J.
Slipped capital femoral epiphysis.
Springfield, Ill., Charles C. Thomas.

The Board of Trustees, at their meeting on November 25, 1953, voted:

To reappoint:
Dr. Robert W. Hopkins as First Assistant Resident in Surgery, effective November 1, 1953;
Dr. John H. Kennedy as Second Assistant Resident in Surgery, effective November 1, 1953.

To appoint:
Dr. Robert L. Brent as Intern on the Children's Medical Service for one year, beginning July 1;
Dr. Julie S. Crocker as Assistant Resident in Anesthesia, beginning July 1;
Dr. Walter B. King, Jr. as Third Assistant Resident in Pathology, beginning July 1;
Dr. Bernard Loitman as Second Assistant Resident in Radiology, beginning July 1;
Dr. Dean L. Moyer as Second Assistant Resident in Pathology, beginning July 1;
Dr. Henning Pontoppidan as Assistant Resident in Anesthesia, beginning December 1, 1953;
Dr. Leonard J. Rothfeld as Assistant Resident in Anesthesia, beginning July 1;
Dr. Richard J. Stenger as Third Assistant Resident in Pathology, beginning July 1;
Dr. Thomas J. Whitfield as Intern on the Children's Medical Service for one year, beginning January 1.

At their meetings on November 18 and 25, 1953, the General Executive Committee voted:

To promote:
Dr. Wilma J. Canada to the position of Resident in Radiology, effective January 1;
Dr. Si-Chun Ming from the position of Second Assistant Resident to that of First Assistant Resident in Pathology for one year, beginning January 1;
Dr. Jane S. Rasmussen from the position of Intern to that of Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Frederick S. Tomchik to the position of First Assistant Resident in Radiology, effective January 1.

To continue the appointments of:
Dr. Maurice M. Pechet as Clinical and Research Fellow in Medicine, on leave of absence, for one year, from October 1, 1953 through September 30, 1954;
Dr. Nancy Rollins as Clinical Fellow in Psychiatry, from January 1 through June 30;
Dr. Rhett Talbert as Clinical and Research Fellow in Neurology, for six months, from January 1 through June 30;
Dr. Frederick E. Whiskin as Resident in Psychiatry, through December 31.

To appoint:
Dr. Jack R. Dreyfuss as Clinical Fellow in Radiology for one year, beginning July 1;
Dr. William E. Gatlin as Clinical Fellow in Radiology for one year, beginning July 1;
Dr. Robert B. Giles, Jr. as Clinical and Research Fellow in Medicine for one year, effective as of October 15, 1953;
Dr. George H. Gray, Jr. as Research Fellow in Neurology, assigned to the Electroencephalographic Laboratory, for a period of six months, beginning December 1, 1953;
Dr. Adil O. Icgoren as Clinical Fellow in Radiology for one year, beginning January 1;
Dr. John J. Lorentz as Clinical Fellow in Physical Medicine for one year, beginning August 1;
Dr. Morton J. Olin as Clinical Assistant on the Dental Service, effective as of November 4, 1953;
Dr. Georges Ouzounian as Graduate Student Assistant in Surgery, effective as of November 18, 1953;
Dr. Paul M. G. St. Aubin as Clinical Fellow in Radiology, on leave of absence, from

January 1 through June 30;
Dr. Otto A. Wurl as Graduate Student Assistant in Medicine, assigned to Cardiology, for one year, beginning November 1, 1953.

* * *

On Thursday morning, December 3, Mrs. Mildred B. Plunkett, language therapist in the Language Clinic of the O.P.D., was the guest of Polly Huse on the "Domestic diary" program of WBZ-TV. Mrs. Plunkett told of the interesting and important work being carried out in this Clinic for patients referred from other clinics who have language disabilities — such as speech defects, learning problems complicated by reading disabilities, loss of speech, etc.

With Mrs. Plunkett on the televised program was a young boy who has been helped by this therapy, and together they demonstrated some of the techniques used in aiding a child with a specific reading disability.

It was through the courtesy of the United Community Services that this telecast was arranged.

* * *

ILEOSTOMY CLINIC

History. Nearly half of the patients with ulcerative colitis seen at the Massachusetts General Hospital in the past thirty years have required ileostomy. This represents a surviving population of approximately 250 individuals, most of whom were, at the time of their operations, at the beginning of the active and productive part of their lives.

Ileostomy patients previously received advice as to the proper care and management of their intestinal function from individual doctors in the Gastrointestinal Clinic and from other patients with whom they chatted on the waiting benches in the O.P.D. That such a method of handling the problem of rehabilitation had been successful in its final result was evidenced by the report of Dr. L. S. McKittrick and Dr. F. D. Moore in 1947(1), stating that of 150 patients carefully followed, 97% were able to undertake full, gainful activities and 67% were completely free from restrictions in their social lives. But that such a method of rehabilitation was ungainly in its mode of operation became more evident as the number of new ileostomy appliances on the market has increased.

In January 1951 a group of interested individuals in the Gastrointestinal Clinic gathered together, in order to provide for patients in need of ileostomy rehabilitation (a) the benefit of the opinions of several doctors at once and (b) an opportunity for group discussion with other ileostomy patients of many of the problems with which the novice is beset, such as skin irritation, deodorants, avoidance of stomal shrinkage, and leakage.

Activities of the Clinic. Since its first meeting on January 2, 1951, the Clinic, which meets as a subdivision of the Gastrointestinal Clinic on the first Tuesday of each month, August excepted, has been visited 158 times by 49 patients. Patients who have ileostomy problems are seen by appointment and recommendations are made from the group of doctors present. Short, informal discussions frequently follow, at which samples of available appliances are demonstrated.

The Ileostomy Clinic is much like the Amputation Clinic, in that eligibles are not confined to alumni of our hospital wards. Patients from other hospitals and from private doctors frequently appear for guidance. Furthermore, it is not confined entirely to ileostomy patients. The occasional colostomy patient who has a problem, particularly the "wet colostomy", has been helped by discovering that there are many tricks and appliances to choose from, one of which may be more adapted to her particular problem than any she had heard of before.

A reference file is kept in the Clinic, which serves as a storehouse of information on every topic related to ileostomy and is available to all who are interested. No such impartial clearinghouse for information had previously existed.

QT Boston. When the Ileostomy Clinic was first organized, a discussion group was held following the period of medical examination. It soon became apparent that, although the group was supposed to be run by the patients themselves, the presence of professional people at the meetings made it difficult for this to occur. Accordingly, under the energetic guidance of Mrs. Lenneberg, operating along the lines of and carrying a name like the QT Alumni of New York(2), but conceived and organized independently, a group of patients met for the first time as an autonomous body in October 1952. The meetings of this group, having been originally confined to patients only, now are open on alternate months to other interested individuals. They are held monthly at some point outside the hospital. The membership has grown from a nucleus of 9 women at the first meeting to 35 of both sexes at the last meeting— with 58 active members.

The QT Boston supplies two needs which the discussion group in a hospital could not, namely, that of free discussion among one's peers with regard to handicap and that of a psychological realization that one has cut the string binding one to the hospital. If the Ileostomy Clinic had anything to do with the formation of such a group, it can be proud thereof.

Organization and personnel. Any patient wishing to visit the Clinic may obtain information from the Admitting Office of the O.P.D. Information concerning QT Boston may be procured from Mrs. Edith Lenneberg of 12 Mason Street, Cambridge; telephone ELiot 4-6277.

The individuals who have organized and served the Clinic have been so many that an attempt to name them is tantamount to omitting at least one. The doctors have been Daniel S. Ellis, John B. McKittrick, Warren Point, and Richard Warren. Miss Dorothy E. Kellogg of the Social Service Department, Mrs. Ruth Foley, G-I Clinic secretary who is a volunteer, Miss Gertrude Leonard and Miss Lois Martin who have served as Ileostomy Clinic recorders, have all done their valuable parts. By far the most important element in the Clinic, however, has been its nursing guidance. For what other condition gives more of a challenge to that particular service which only a nurse can provide? To Mrs. Lena Glass Miller belongs the original concept of the Clinic. When illness forced her withdrawal there followed a succession of individuals without whose services the Clinic could not have continued. Acknowledgment is made to Mrs. Ruth Farrisey, Mrs. Sue Gardon, Miss Margaret Manning, Mrs. Margaret Smith, Mrs. Cecelia Winston, and to Mrs. Margaret Matthie who, despite her many other duties, is the present enthusiastic and efficient Supervisor of the Clinic.

HAND CLINIC

The Hand Clinic at the Massachusetts General Hospital was instituted entirely through the efforts and interest of Dr. Henry C. Marble. He had long had an assignment on infections and injuries of hands, and as a result of his visiting the Out-Patient Department to see follow-ups, the House Staff gradually made appointments for hand patients to come in at a given time. Thus, after a period of years, the Hand Clinic came into being in about 1930. For several years Dr. A. William Reggio and Dr. Franklin G. Balch, Jr. shared the assignments and instruction of the House Staff.

Dr. Marble's enthusiasm, knowledge, and personality stimulated many of the House Staff to greater interest in injured hands and it was axiomatic that, whereas one could obtain help in the case of the gallbladder or complicated appendix patient from any one of a number of the Visiting Staff, there was only one source to apply to for hand problems.

In 1946 Dr. Marble retired, and hand problems were assigned to Dr. Edward Hamlin.

Hand problems — involving, as they do, skin, tendon, nerve, and bone, and their altered physiologies — require for effective therapy either the wide experience of one individual or of a pool of individuals who are experienced in the separate specialties involved.

During World War II hand injuries, which were very numerous, were grouped in centers where the attending surgeons acquired a vast experience in reconstructive hand surgery in a relatively short space of time. It is these men who are now in charge of a great majority of the hand clinics in this country.

Since no one on the staff of the Massachusetts General Hospital had had exactly that experience, it appeared wise to bring together interested staff members whose total experience would include all the various specialties associated with any hand problem. Accordingly, in 1946, the Hand Clinic was reorganized to include Dr. Joseph S. Barr, Dr. James C. White, Dr. Bradford Cannon, Dr. Arthur L. Watkins, and Dr. Charles B. Burbank. This group has remained intact up to the present time.

The Hand Clinic functions in an advisory capacity only. There is no operative assignment, although the members will frequently assist or even demonstrate a procedure for the benefit of the House Staff.

This year the Hand Clinic has become the first Out-Patient Department clinic to accept private, paying patients. In order to increase its scope and because a vast majority of hand injuries are those of private patients under the Workmen's Compensation Act, the Trustees and the General Executive Committee of the Massachusetts General Hospital voted to establish a consultation service for patients of any income category, either as in or out patients.

The Hand Clinic meets on Wednesdays at 1 P.M. Arrangements have been made to facilitate the admission of all patients to the Clinic without waiting. Appointments for patients may be made by sending a letter with pertinent information to the Out-Patient Department, attention of the Hand Clinic secretary. Appointments may also be made by telephoning the Hand Clinic secretary at Extension 2135.

Edward Hamlin, Jr., M.D.,
Head of Hand Clinic

Brief bits:—

Dr. Mary A. B. Brazier was one of the invited speakers at a symposium held during the December 26-31 meeting of the American Association for the Advancement of Science, in Boston. The subject discussed was "Experimental approaches to the study of brain function".

Dr. Bradford Cannon has been appointed to the Forum Committee by the Board of Regents of the American College of Surgeons. He and Mrs. Cannon recently returned from a professional trip to the west coast.

Dr. Edwin F. Cave has returned from a trip to the Universities of Minnesota and Colorado, where he gave a series of lectures in each institution on "Management of fractures". He spoke also to the Minnesota Pathological Society on "Pathological fractures".

On October 1, 1953, Dr. Edward D. Churchill accepted the position as Senior Civilian Consultant in Thoracic Surgery to the Surgeon General. On November 5, Dr. Churchill was appointed to serve on the Commission on Organization of the Executive Branch of the Government.

Dr. J. Gordon Scannell addressed the U.S. School of Public Health on November 17. The subject of his talk was "The place of surgery in tuberculosis control".

Dr. Anne Wight, who is President of the New England Division of the American Women's Medical Association, presided at the annual fall meeting of the Association, held in Winchester.

DR. MEANS AND M.I.T.

You have asked me to write you concerning my present activities at Massachusetts Institute of Technology. In the first place I may say that I am having a wonderful time there, and this is due both to the nature of the work and to the great cordiality and consideration with which I have been treated by my chief, Dr. Dana L. Farnsworth (*W.M.* 1935), and by all the other members of his department. Although I shall always love the M.G.H., it nevertheless is the truth that I have been so happily busy at M.I.T. that no incapacitating nostalgia for the M.G.H. has beset me. Another factor in this may be the fact that we have a goodly sprinkling of MGH-ers in our department, including my devoted secretary, Mrs. Fouhy. Of course I no longer need her for more than a fraction of her time, but she works for the department and even part time as private secretary to Mrs. Killian, the President's wife.

I have learned since coming to M.I.T., and I suspected it before, that the best way to deal with required retirement at a fixed age is to get a new, but slightly easier, job, in a field as professionally satisfying as possible.

The medical department at M.I.T. is a medical practice group offering complete medical care, preventive as well as corrective, for the whole M.I.T. family — students, faculty, and employees —if they desire it. Major surgery is covered by affiliation with the M.G.H. and other nearby hospitals. In Tech parlance, it is a service department, not a teaching department, but indirectly Dr. Farnsworth has exerted a great influence on education here by convincing the faculty that it is not enough merely to fill the mind with knowledge; to make the knowledge useful, both mind and body must be kept healthy. The marriage of psychiatry and education, which has been consummated here under Dr. Farnsworth's leadership, is a pioneer movement of great educational importance.

My own activities in this setting are as follows: I have ten hours a week of office practice, in which I see whoever pops in, and care for him if I can, or I summon one or more of our specialists if I need help. I may say that it is far easier to get this specialist service here than at the dear old M.G.H. We are a more compact and closely working team.

Another activity which I much enjoy is that of taking part in a health survey of the faculty which Dr. Farnsworth started in 1950. Every member of the faculty who wishes the service is given a thorough medical check-up annually, and any service between times which his care may require. It is an undertaking in preventive medicine to keep our very valuable faculty in as good health as possible.

I have accumulated in this practice some 158 faculty members who not only have got their health check-ups from me, but who in return have given me many fascinating bits of information about the many disciplines they represent. In the initial health check-up each patient, after seeing the physician, is also seen by ophthalmologist, otolaryngologist, and psychiatrist. No one has objected to seeing the psychiatrist, and the fact that the professors do this sort of thing has taken all stigma against consulting a psychiatrist out of the minds of the students. They come in now on their own initiative and ask for a conference with a psychiatrist about some personal problem that may be troubling them.

Because medical education is a major interest of mine, I looked about at Tech for some way of keeping in touch with it. This was easily found in the shape of pre-medical students. Although M.I.T. is primarily an engineering school, there are nevertheless some forty to fifty students who are planning to go into medicine. With these I have had some contact on a purely informal or voluntary basis. Many of them come to me to talk over their plans, and often to have their medical school applications signed by a college doctor. Also I interview a certain number of Harvard Medical School candidates sent to me by Harvard.

An interesting activity related to medical education takes the form of psychodynamic group meetings for pre-medical students. Started originally in 1950 for freshmen as a contribution to their educational process, this experience was offered to pre-medical students beginning a year ago. The idea is that if anyone needs to know himself, it is the physician, and since medical schools have been rather backward in giving their students any such experience, we thought we might make a constructive contribution by offering it to pre-medics. At the present time there are seven groups in operation, each composed of eight to ten students and a psychiatrist. The activity is in its second year and while it is too early to make a really significant appraisal, the results to date seem to indicate that many of the participants believe at least that they have gained some insight as a result of the experience.

My other hours at M.I.T. are miscellaneous — seeing patients by appointment, making infirmary visits, etc., etc. I do no outside medical practice except a rare consultation at the Phillips House or Baker. I am still a full timer. Dr. Farnsworth, however, has been very generous to me in the matter of vacations and ease of schedules, so I have time for a number of extracurricular activities—writing books and papers, attending medical meetings, and occasionally giving talks either on the thyroid or on the public affairs of medicine. The latter is of constantly increasing interest to me. I also have time to travel, indulge my favorite pastime of watercolor painting, and above all, to enjoy life with my wife, family, and friends.

For many years, while at M.G.H., I had made abortive efforts to introduce teaching rounds on the medical patients in the Baker. It is Dr. Bauer, however, who has finally achieved this, and I am very happy that I am to have the opportunity to participate, beginning this January, in his program. It will be for me a "refresher" experience of great importance.

James Howard Means, M.D.,
Past Chief, Medical Services, M.G.H.,
now a member of our *Board of Consultation*

VOLUNTEER GROUP

Distaff Club

Our Christmas Party, held in the Penthouse on December 17, was a fine start for the holiday season. Mrs. Howard S. Frazier, Chairman, arranged a very enjoyable evening.

The Distaff Club members are looking forward to the meeting planned for January 28. Mrs. Margaret N. Southworth, a representative of Shreve, Crump and Low Company, will speak on general home decor.

The Distaff Club is no longer in charge of reservations for the Penthouse. These reservations may now be made through Dr. Clay's office.

Mrs. George D. Zuidema has been appointed Chairman in charge of the general housekeeping of the Penthouse.

Mrs. Federico Mora is the Chairman of our Housing Service. Anyone desiring information about apartments in or around Boston may telephone her at STadium 2-4441.

It was "Cap'n Nay" for him, and "Mister Billy" for me until I began medical school when it became "Doctor Billy", and I really didn't know whether I was going forward or backward.

Nay was impressive. He stood six and two, and all of his one hundred eighty pounds were muscle and bone. But his bearing spoke more eloquently of physical power, and by his features one knew that Nay had lived — at first like a great fish hooked and fighting until, in time, there came understanding. Wisdom and mirth lurked with sorrow in his dark eyes. Nay was gray along the temples and bald on the top of his head when we first met. Still, he could beat me in a foot race, knife throwing, card playing, and certainly at baseball and at hunting.

Nay had played on a pick-up country ball team for years, and he and it took great delight in traveling about the South and beating the city boys. Nay batted cross-handed and played center field. I'm certain he could have placed hits with any of the greats like Cobb, Wagner, or Doyle.

Cap'n Nay had an old loosely-jointed, single-barrel Iver Johnson. Shells were five cents apiece during the early thirties, and he could afford only two or three at a time. When he went hunting two shells were the equivalent of two rabbits, or two squirrels, and once, to my knowledge, three partridges. Nay always said he couldn't afford to miss, and he couldn't. I've often marveled that he did bring up eight children during the depression on nine dollars a week.

It was really through some of his boys that I got to know Cap'n Nay, and probably because of them I developed a proficiency at golf. When I first met Nay he was caretaker for the small golf course in Warrenton, a southern town of a few more than a thousand people. The course had been built in the flush of the twenties. During the early thirties only a few people were playing. Men who had been extremely interested in golf were struggling to get enough to eat. I was the only teen-ager who made use of the course. Certainly, in the mornings Nay's boys and I had the course to ourselves. They had been playing with an odd assortment of clubs for quite a while. Charlie, the oldest, was a natural. His only trouble was that he swung left-handed and we had only right-handed clubs. Yet more than once I've stepped off 275 yards to measure the distance he hit a ball on the fly, using the *back* of a right-handed club. Sammy, the youngest, wasn't big enough to hold a man-sized stick out in front of him, yet he played a creditable game by using an open stance and holding his hands well in front of the club head. He was unusually good around the greens, for here his stance and natural deftness produced an unparalleled cut shot with which he sank dozens of approaches.

Nay never played, but he did putt. He putted cross-handed. He seldom missed, and he never missed if there were a penny or a nickel to lose. Some people have that championship capacity — to win best when the chips are down. In his own way Cap'n Nay was a graceful champion, and I used to think that this quality was entirely inborn. Later it seemed to me that it could be acquired. Skill in shots was relatively easy to come by, but it was three years before I could beat in a match some people whom I outshot easily.

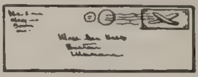
Actually, my first real win was something of a fluke, although Nay thought I, too, was becoming a champion. In an early interclub match I got into the rough two or three times. Sammy was caddying for me. In the heat of competition I did not notice that my lie was as good as if I had been in the fairway. When the match was over I noticed that Sammy was barefooted, though he usually wore shoes for the tournaments. Of course he flatly denied having moved the ball in the rough.

Three weeks later Sammy caddied for me in the quarter-finals for the club championship, and we were pitted against the club champ. At forty, the champion was a fine golfer and a superb gamesman. At fifteen, having been beaten badly by him the year before, I knew he had my number. But I had decided to isolate myself from his gamesmanship with utter silence. I was on edge when Sammy showed up just before we were to tee off — barefooted again, with prehensile toes, and Enoch's overalls all but covering his feet. "No, I don't have any shoes; they are in the shoeshop. No, I can't borrow Enoch's because they hurt my feet. And *besides,* I have never ever moved a ball in the rough. I certainly wouldn't today." Certainly wouldn't get caught, I thought to myself. The quarrel calmed my nerves, Nay showed up in the gallery, and we proceeded to do the only thing left under the circumstances. We hit every fairway and dropped every putt. The champ tied the old course record, and we set a new one. Cap'n Nay was as proud as my parents and I, and Sammy was ecstatic.

That was my last summer at home until I took a long vacation this year. The golf course had grown and become a club. Nay's fairways ranked with the best in the State. His boys were scattered all over the country and apparently are prosperous in industry. Nay was emaciated and jaundiced. He had not wanted to go to "Mr. Duke's Hospital". He was more frightened of an operation than of death. Yet upon the advice of his friends he went through surgery. I often wished I might have been there, that he might have had a gallstone instead of cancer, and even that he might have slipped away under anesthesia. Instead, he lay farmed out to Warrenton's new hospital. The power of his body was all gone, but the strength of his soul was still clearly in his face. "It's good to see you, Mister Billy," he said.

He fell asleep that night. In dying he was granted what so many people are denied — the capacity to be a champion to the end. Thus, one's youth becomes memory, and people like Cap'n Nay go on living.

William P. J. Peete, M.D.,
Resident in Surgery



This most interesting letter and a lovely Christmas card have come from Dr. Thip Pholpoke (gr. stud. a. S. 1952). From the Army Hospital in Bangkok, Thailand, he writes:

> What I have to say is to apologize to you for the long delayed reply to your letter.
>
> I enjoy receiving and reading The News, which you regularly send me. This sometimes takes two months to reach Bangkok from Boston.
>
> Bangkok and Thailand are no more little known to Americans these days. I understand that most of the American tourists include Bangkok in their journeys. Last spring we were privileged by the short visit of Dr. E. D. Churchill. We all hoped he could stay longer in Bangkok. I also met Dr. John Wilson, who came to work here for over a year and is now taking the chair in Surgery at the American University of Beirut.
>
> In Thailand we are rebuilding and adding more in all fields, in order to enable us to

live up with the modern materialistic world. The medical fields are included, too. We hope that when the Buddhist Era reaches 2500 years (this year is B.E. 2496), we may have something to show the world.

We are sending more students to the M.G.H. We will try, at least, to keep a student there always. At the present moment Boston and its vicinity are hosts to no less than 50 students from Thailand.

I hope that one day you might come over to see us. Please let me know if you or any MGH people have that plan in mind.

This letter has come from Dr. John W. Smillie (*E.S.* 1944):

The last three very pleasant years have been spent in Minneapolis with the Division of Ophthalmology of the University of Minnesota Hospitals and Medical School.

Our new home is to be at Ann Arbor, Michigan, as I have accepted the invitation of Dr. F. Bruce Fralick, Chairman of the Department of Ophthalmic Surgery, University of Michigan, to become Chief of the Section on Ophthalmology in the newly opened 500-bed general Veterans Hospital there.

In addition to having received a graduate degree in Ophthalmology, I have recently become a diplomate of the American Board of Ophthalmology.

Please change my mailing address for The News to Section on Ophthalmology, Veterans Hospital, Ann Arbor, Michigan.

From Lt. George B. Murphy, Jr., MC, USNR (*S.* 1952) came this note:

Your last copy of The News chased me around the world and finally caught up with me back here in the Boston area, where I am at present stationed at the Chelsea Naval Hospital.

I've enjoyed The News very much, especially when it reached me in such places as Djibouti and Bangkok. Thank you for your interest and effort in sending it to me.

I hope to be back at the M.G.H. before too long.

This brief but cordial note has arrived from Dr. Manucher Javid (r.s. *N.S.* 1952).

I have missed receiving the MGH News. Somehow, between being very busy here at the University Hospitals since our arrival in Madison, enjoying a long-awaited visit of my parents from Iran, and the arrival of our daughter, Roxane Maria, I failed to send my subscription, which is enclosed. I shall look forward to receiving The News and keeping up with "What's New?" at wonderful M.G.H.

Miss MacDonald, one of our faithfuls up there on our telephone switchboard, has passed on to us this letter from Dr. Fred Alexander (clin. & res. fel. *M.* 1949). From 125 Old Gulph Road, Wynnewood, Pennsylvania, Dr. Alexander writes:

Since our departure from Boston we have been constantly on the move. I'm quite the married man now, having three children and all that goes with them. People say they are well mannered and well behaved, but I see to it that they aren't too much so. My free and easy bachelor days are gone, and probably for the best, although when the bills come in somebody has to twist my arm to convince me.

But actually we're all having a wonderful time. At present I live in a suburb of Philadelphia, teach part time at the University of Pennsylvania, and do the cardiac work at one of the larger industrial concerns in town. The situation is tolerable, but only so, for I do miss the M.G.H., as does everyone else who has been privileged to spend some time there.

I met the husband of Mary Butler, the girl who worked with me in the Hypertension Laboratory. He is working as a Fellow in Endocrine Diseases at the University of Pennsylvania.

Haven't heard a word from my friends Cooper or Evelyn in years. Time and distance seems to make a big change.

I was distressed to learn about Dr. Smith-Petersen. Was sorry I didn't get a chance to send him a card, but I didn't know he was sick. I considered him one of my best friends.

Regards to everyone at M.G.H.

This short note has come from Dr. George A. Culver (a.r.p. *An.* 1950), whose stationery gives as an address simply P.O. Box 17039, Houston 4, Texas.

After three years with Baylor Medical, doing full-time clinical teaching of Anesthesiology, I have resigned and have gone into the private practice of Anesthesiology here in Houston. Therefore, I am no longer with the Jefferson Davis Hospital.

Here is another "singleton" letter — from Dr. Robert J. Vitt (a.r.s. *Or.* 1951), who gained that distinction when he opened an office for the practice of Orthopedic Surgery in the Beebe Building, 210 South K Street, in Tulare, California. He writes:

Yes, it is true that I am the only MGH Orthopedist within a radius of 45 miles, in a 2-county area, serving some 220,000 people. I have been in practice in Tulare, in the heart of the San Joaquin Valley of California, since February 1953, and have the nucleus of a comfortable, diversified practice. There has been an influx of specialists into the Valley recently, perhaps due in large part to our beautiful brand new District Hospital.

This is at present a farming community, with irrigation producing bountiful crops of fruit and cotton. The cattle industry is also very flourishing. Toward the east, we are 2 to 3 hours' drive from the best trout streams in the country, and toward the west, a similar distance from the ocean. This, and the fact that my office and the hospital are 2 to 3 minutes' drive from home, represent some of the big reasons for my locating here.

My practice is in large part an industrial one, but I have a polio and crippled children's clinic besides rehabilitation work. We have an up-and-coming County Hospital with six Residents, so some teaching is in order.

* * *

HAIL AND FAREWELL

We, at the Massachusetts General Hospital, had to say good-bye recently to a faithful friend, and Boston lost one of its oldest landmarks, when it became necessary to tear down the Paint Shop Building which had stood for so long on the northeast corner of Cambridge and North Grove Streets.

Soon after we came to Massachusetts General we set about to collect all available data concerning this lovely old building from various local sources. It was through help given us by the staff at the Bostonian Society, in the Old State House on Washington Street, that we secured the most information. Here are a few sentences culled from their files:

A tradition connects Bulfinch with a market, still standing, built by Samuel Parkman at the corner of Cambridge and Grove Streets in 1810. The only architectural feature discoverable today is the simple cupola set in the middle of the roof, which is interesting for its association. . . . — *Charles Bulfinch — Architect and Citizen*, by Charles A. Place, Houghton Mifflin, publishers, 1925, p. 141.

From Scrapbook M, p. 75, at the Bostonian Society, we gathered the following bits of additional information, from an article which appeared in the *Boston Globe* of October 28, 1924, written by Alexander Corbett:

. . . probably designed by Charles Bulfinch, who planned the State House. Parkman's Market was plainly modeled on Faneuil Hall as built by Peter Faneuil in 1742. The only striking difference between the two is found in an extra story in the Parkman Market, and an absence of the pilasters that adorn the exterior of Faneuil Hall.

. . . Parkman's apparently was not much needed in the West End, for it ceased to be a market a few years after it was built, and has since been in succession a piano and organ factory, a paint and blacksmith shop, a grain warehouse, and even a tenement house.

The custodian at the Bostonian told us that Mr. Corbett was a very careful historian and checked his facts thoroughly before giving them out.

Scrapbook Q, page 76, contains the following, in part, from an undated, unknown newspaper, and by an unidentified writer:

. . . Samuel Parkman died in 1827. The Market House passed by will to Dr. George Parkman, victim in one of Boston's saddest and most memorable tragedies, and with his heirs the old Cambridge Street building still stands.

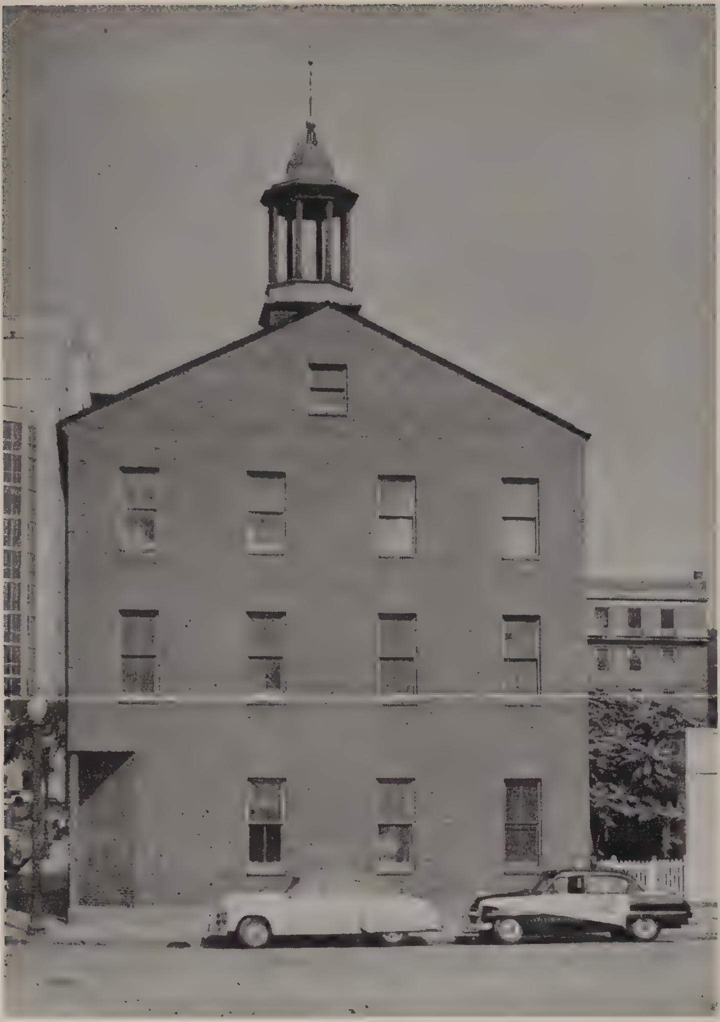
Hook & Hastings, and Plaisted & Hutchins manufactured famous church organs here. . . . The Parkman Market was designed by the same master hand [Bulfinch] . . . . seems to have had a kind of cold-storage proposition in his architectural head when he drew the plans for this building. For they say the walls of the old market are two feet in thickness.

But the most striking thing about this nonagenarian building is the cupola which surmounts the roof, a quaintly designed affair, which cannot fail to attract the attention of the passerby. . . .

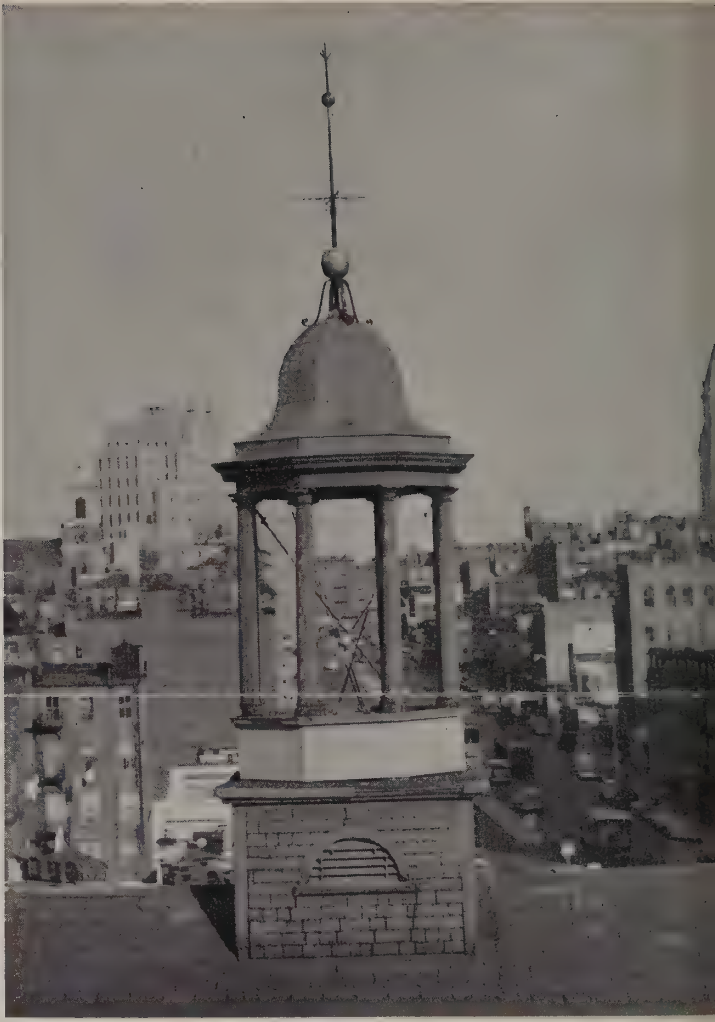
On pages 7, 50, and 58 of Dr. Washburn's history of M.G.H. we learn of the circumstances associated with the acquisition of the old Market Building by the Hospital in 1908, and the reduction in its size made necessary by the widening of Cambridge Street in 1924.

But now the old building is no more, and it would take a poet's pen to give it the epitaph it merits. Its time-mellowed bricks had taken on a soft patina that only long years can bestow; the simple dignified beauty of the cupola made an appeal that even the most indifferent could not ignore; and the wind vane which topped the cupola was in a quite literal sense our very good and trustworthy friend. On sultry summer days, when temperatures were soaring, it often brought us relief when our hopeful eyes sought out its message and could read as clearly as if it were in headlines, "Cheer up! Take heart! Boston's east wind is here!" And on lowery winter days, when we were apprehensive as to weather developments, it was no less our friend and, like a lookout atop a foremast, would give us warning that a no'theaster was heading our way.

As soon as we learned that the building was to be torn down we appealed to Mr. Donald Withee, Head of our Photographic Laboratory, and we have him to thank for the excellent picture of the building and the closer-up of the cupola. A few days after these pictures were taken we happened to discover that the wind vane was in Dr. Clark's office, disassembled and waiting to be shipped, along with the cupola, to their



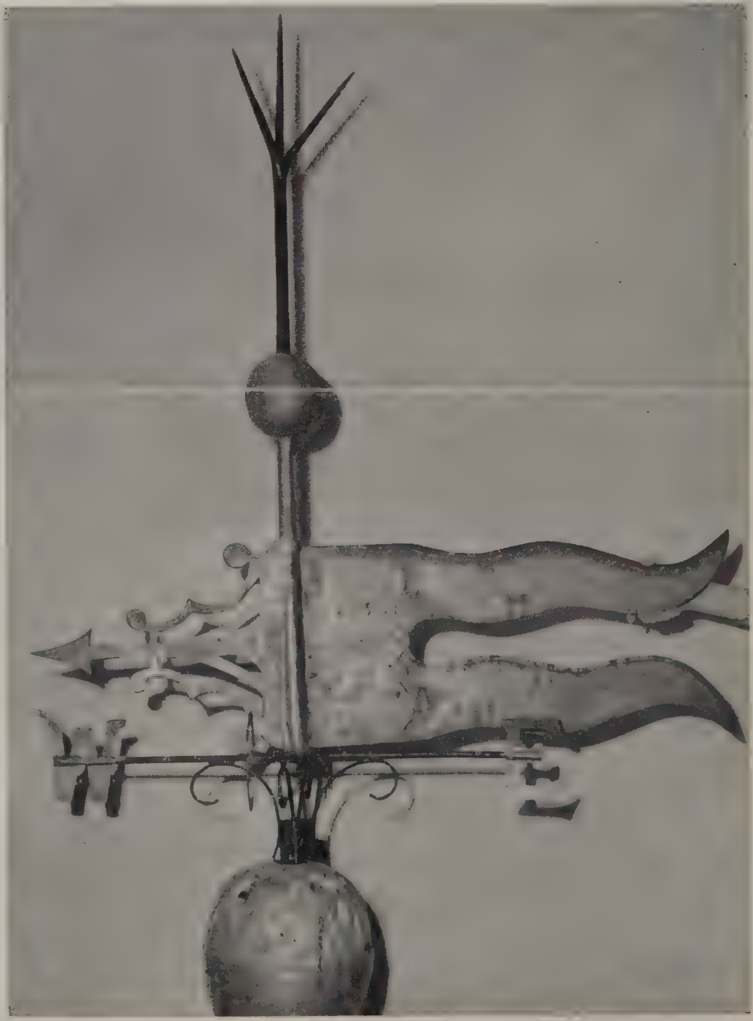
THE PAINT SHOP



THE CUPOLA

future dwelling place at the summer residence in Maine of Mr. Francis W. Hatch, a member of our Board of Trustees. As it lay there in the corner, it seemed to us like a creature of the elements, almost cruelly brought to earth by man (albeit with gentle hands), and we found ourselves loath to draw too near, lest our slightest motion might frighten this companion of the zephyr and the gale. But, as we drew nearer and studied in detail the beauty and delicacy of its design, its fluted gold-leaf wings which gave the effect of having been riffled by the very winds themselves, we resolved to capture a close-up picture of this creature before it could escape our reach. A hurried telephone call to our Photographic Laboratory brought Mr. Frank McCarthy in response to our strange request. Together, and with considerable difficulty, we managed to procure a picture of the vane which will give you some idea of its beauty. We regret that since there was no way of fastening its rather heavy and unwieldy parts together, the hint of a human hand had to intrude.

We hope and trust these two old friends of ours will be happy in their new home. As for us, the old Paint Shop with its cupola and vane will remain an enduring memory; and we know that for all time to come we shall find ourselves searching the sky toward where the cupola used to be and that there, as now, against the blue or the gray, we shall see the wraith-like outlines of the Bulfinch (?) cupola and its beautiful companion, the wind vane.



THE WIND VANE

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 131 Boston, Mass. February 1954

THE BLOOD BANK

In the May 1952 issue of THE NEWS Dr. Lamar Soutter gave a very detailed description of the history and function of the Blood Bank as it had developed during the ten years of its existence. On November 1, 1952 Dr. Soutter resigned as Director of the Blood Bank to take over the position of Associate Professor in Surgery at Boston University.

In writing another article about the MGH Blood Bank and its activities the opportunity should certainly not be missed to pay tribute to its founder and former Director, Dr. Soutter—one of the most active blood bank pioneers in this country. His enormous energy and working capacity, combined with talent as an organizer of high executive ability, have been of great value not only to the MGH Blood Bank but also to a great number of other organizations in the blood transfusion field.

The extent of Dr. Soutter's activities in blood transfusion work can be partially appreciated from the fact that when he resigned and gave up this work in order to give his full time and energy to surgery, he was holding the following positions: Director of the Blood Bank, Massachusetts General Hospital; Director of the Blood Bank, Chelsea Soldiers' Home; President of the New England Association of Blood Bank Directors; Chairman of the Blood Section, Medical and Health Division, Massachusetts Civil Defense Agency; Chairman of the Committee on the Supervision of the Massachusetts Red Cross Blood Program; and Massachusetts State Representative of the American Association of Blood Banks. All of these responsibilities are now divided among several blood bankers and, from one who had the privilege of taking over about 50% of Dr. Soutter's duties in the blood transfusion field, great admiration goes to the man who, in an excellent manner, was able to fulfill all 100% of them and still have time left for surgery.

Most of the changes and developments which have taken place in the Blood Bank during the recent years have been in the laboratory procedures. The tremendous increase in our knowledge of immunohematology, and in particular of blood group serology, has brought us closer to the day when the prediction made about 25 years ago by the Nobel Prize winner, Dr. Karl Landsteiner, will be true — namely, that "human beings have blood group patterns as distinctive and individual as fingerprints". We are already dealing with 9 well-defined blood group systems, each of them containing a number of different blood factors. Furthermore, several so-called "private" blood factors, existing only in members of the same family, have been described.

A continuous search for antibodies against all these different blood group factors is an important part of the daily routine and research work in our Blood Bank Laboratory. This work is of great clinical importance because it is the fundamental rule in all blood transfusion therapy that the blood of the recipient must contain no antibodies against the donor's red cells, and vice versa. Therefore, a series of tests, including a complete screening test for antibodies, is carried out on all blood samples from our patients in order to protect them from having hemolytic reactions in connection with blood transfusions.

To keep this work going, the cooperation of several of the Hospital employees has been needed and is still needed in order to keep available in the Blood Bank, at all times, a sizable "cell-panel" consisting of red cells of various blood group combinations which can be used for identification of blood group antibodies.

Besides being a protective mechanism against hemolytic transfusion reactions, the search for blood group antibodies and eventual stimulation of these in selected professional donors has been an important part of a Blood Procurement Program which has now for more than two years been working successfully in cooperation with commercial laboratories. Under this program the Blood Bank has been able to furnish, at a very low cost to the Hospital, testing sera of all different varieties, despite the fact that there is a constantly increasing need of these sera in our laboratory.

With the cooperation of our patients and members of the professional staff it has also been possible to obtain a considerable quantity of testing sera containing very rarely found blood group antibodies. In this connection it is worth while mentioning that the first sample of anti-Lu^a serum in the U.S.A. was found in our Blood Bank Laboratory.

Samples of these rare testing sera have been sent to blood bank laboratories all over the world in order to help these laboratories in their work of building up "cell-panels" tested for the various blood group antigens.

A great deal of time has been devoted to the teaching and training of laboratory technicians from other hospitals in the United States and doctors from other countries. This field of blood banking and blood group serology is still a relatively new specialty in medicine. It was therefore felt that, to the greatest possible extent of its ability to devote time for this purpose, our Blood Bank should incorporate this training program in its daily work. During the last half-year it has also been part of the Hospital's teaching program that doctors who are training in the Department of Pathology shall rotate for two months through the Blood Bank. The reason for this is that in smaller hospitals it is often the rule that their blood bank is supervised by their pathologist.

CIVIL DEFENSE ACTIVITIES

About two years ago a memorandum was sent to all hospitals in the State of Massachusetts from the Blood Section, Medical and Health Division, Massachusetts Civil Defense Agency, emphasizing the great importance of having all hospital transfusion services take active interest in being prepared for a major disaster in the Commonwealth. The State goal was to have a mechanism (set up by regions) capable of producing at least 100,000 pints of blood to take care of the first 24-hours' demand in case of an atomic bomb attack. During the years since this memorandum was received our Blood Bank has taken several steps to prepare itself for maximum cooperation in the program.

First, a training program of phlebotomists was started. Besides having all technicians working in the Blood Bank Laboratory trained as phlebotomists, several volunteers have been trained for this purpose, also. Many of these volunteers are employees in other departments of the Hospital which are not expected to be activated under disaster conditions.

Second, the Fenwal plastic blood pack has been tried out and is still used in limited quantities in order to keep the Blood Bank personnel, as well as the intravenous nurses and the house officers, trained in the use of this type of transfusion equipment. The reason for this is that the Fenwal plastic blood pack is the type of equipment which is being stockpiled by the Civil Defense Agency for disaster blood transfusion.

Third, all patients and donors who are being typed in the Blood Bank Laboratory receive Civil Defense cards, showing their ABO-group and Rh-type. Also, all Hospital employees are being typed and furnished with Civil Defense cards. An estimated 25,000 people have received their Civil Defense blood type cards through the MGH Blood Bank during the past two years.

Fourth, an effort has been made to stockpile plasma for a possible disaster situation. The plasma has mainly been salvaged from outdated blood. Also, in preparation of packed red cells, an attempt has always been made to remove the plasma under sterile conditions in order that it may be stored for Civil Defense purposes. The cooperation of the clinical staff and house officers in giving the Blood Bank sufficient notice (at least 24 hours) when packed red cells are wanted has greatly helped to increase the stockpile of plasma.

Artery Bank

On January 1, 1953, Dr. Robert S. Shaw was appointed Assistant Director of the Blood Bank, and very soon after his appointment he started the Artery Bank.

Vessels are secured at autopsy, sterilized by the two-million-volt cathode ray at M.I.T., and stored on dry ice according to the method developed at the Children's Medical Center by Meeker and Gross.

Thus far, 25 patients have had arterial grafts inserted which were supplied by the Artery Bank. This facility has greatly increased the scope of vascular surgery at M.G.H., enabling us, for instance, to keep pace with recent developments in the surgical treatment of segmental arteriosclerotic occlusive disease, aortic aneurysm, and coarctation of the aorta.

Surgery requiring arterial homografts is being performed with increasing frequency, and it is expected that the Artery Bank will become an increasingly important activity.

Morten Grove-Rasmussen, M.D.,
Director of the Blood Bank

In an interview with Dr. Grove-Rasmussen concerning his article, we managed to draw out the following data which he has not mentioned in his write-up: Besides being the Director of our Blood Bank, he is now the Director of the Blood Bank at Chelsea Soldiers' Home, Secretary of the New England Association of Blood Bank Directors, and Chairman of the Blood Section, Medical and Health Division, Massachusetts Civil Defense Agency.

Dr. Grove-Rasmussen was born and educated in Denmark. He is a medical graduate of the University of Copenhagen. In 1946 he began the study of blood group serology and blood banking in the United States and at the State Serum Institute in Copenhagen and the Red Cross Blood Transfusion Center in Amsterdam. He worked as a Research Fellow in our Blood Bank in 1948 and 1949. After further study in Europe he returned to the United States in 1950 to become Assistant Director of our Blood Bank, and assumed his present position as Director in 1952. Last summer he represented the Massachusetts General Hospital at the Congress of the European Society of Hematology in Amsterdam, where he addressed the group. Following these meetings he visited several of the large blood transfusion centers in England, including the Lister Institute in London.—*Editor*

The "Hamilton Award" for best parking for 1953 went to Dr. Ward I. Gregg. In the opinion of Mr. George E. Hamilton, the custodian of our doctors' parking lot, Dr. Gregg is a past master in the art of parking.

MASSACHUSETTS EYE & EAR INFIRMARY

EYE PATHOLOGY LABORATORY

The Eye Pathology Laboratory of the Massachusetts Eye and Ear Infirmary has a number of principal activities.

The first relates to an essential requirement of any first-class hospital — namely, an independent unit within the framework of the hospital to process and to report upon pathological material. This function is achieved only through departmental independence, free from other allegiances except the hospital administration. Thus is supplied a diagnostic guide for the staff and a therapeutic control.

Important activities of this Laboratory relate to teaching. The Laboratory of Pathology has numerous contacts in this field. Reports upon routine laboratory specimens given to our staff and to other hospitals of New England have much intrinsic teaching value. Follow-ups augment this. The residents, during their service at the Infirmary, spend three months in the Laboratory (full time). This time, spent either with dogged persistence or with the enthusiasm of an explorer, at least creates a lasting impression upon the resident. When this exposure helps to form a trained ophthalmologist, the result is a man whose clinical problems are attacked with a deeper and better understanding.

Another contact of the Laboratory with a teaching function is through clinical pathological conferences. These coordinate diagnosis and pathology at staff level with ophthalmologists in training, and provide a free-for-all exchange of ideas.

Informal fragmentary and probably valuable teaching experiences derive from the question-and-answer method related to the daily grist of problems provided by the clinic patients. These teaching experiences are not easy to evaluate, but nonetheless probably have substantial value.

One function of the Laboratory is research. This is best accomplished in an atmosphere of independence, free from multifarious administrative duties. Unlike the routine functions of processing-diagnosing specimens and teaching, best conducted within the hospital and clinic, research facilities can be separated from the routine laboratory work and located in another building.

These three functions of a pathologic laboratory have a fine tradition at the Infirmary. Dr. Verhoeff for more than forty years has spread the fame of this Laboratory and the Infirmary over the world. His successor, Dr. Terry, carried on the tradition until his untimely death. It is to be hoped that the future will be as fruitful as the past.

Parker Heath, M.D.,
Director, Eye Pathology Laboratory

Many distinguished guests have visited the Infirmary during the past few weeks.

Dr. Lorimer George Fison of the Institute of Ophthalmology at the University of London has been visiting here for a month, during which time he has been attached to the Retina Service under Dr. Charles L. Schepens, Director of the Service.

Dr. A. Seymour Philips of London was our guest for four days. During his stay he delivered a lecture on "The anatomy of the levator muscle and its application to ptosis surgery".

Drs. Pablo J. Nañagas and Fransico Quilala of the Philippines visited here during the month of January.

The Infirmary also played host to 26 Occupational Therapy students from the University of New Hampshire on January 7. Mrs. Patricia Huddleston, Director of Occupational Therapy at the Infirmary, gave a short talk on the department's program, and Miss Marilyn G. Myers, Executive Secretary of the Boston Eye Bank, described the purpose and functions of the Eye Bank. The students were later given a tour of the Infirmary, and tea was served in the cafeteria.

Dr. Edwin B. Dunphy recently attended a meeting of the Directors of the National Society for the Prevention of Blindness, held in New York. He later addressed the Residents and Staff of the New York Eye and Ear Infirmary on the subject "Glaucoma".

The Board of Trustees, at their meetings on December 11 and 24, and January 8, voted:

To accept the resignation of Dr. Richard W. Dwight from the position of Clinical Associate in Surgery.

To reappoint:

Dr. James J. Ferguson, Jr. as Resident in Medicine, beginning January 1, 1955;
Dr. Stephen M. Krane as Resident in Medicine for one year, beginning January 1;
Dr. Lot B. Page as Assistant Resident in Medicine for one year, beginning October 1;
Dr. Howard Rasmussen as Assistant Resident in Medicine for one year, beginning July 1;
Karl Schmid, Ph.D. as Assistant Biochemist for one year, beginning July 1, 1953;
Morris Soodak, Ph.D. as Assistant Biochemist for one year, beginning January 1.

To appoint:

Dr. Norman W. Andrew as Assistant Resident in Anesthesia, beginning August 1;
Dr. Peter R. Bally as Assistant Resident in Medicine, beginning January 1, 1955;
Dr. Joseph J. Barlow as Resident in Medicine, beginning October 1;
Dr. Roy J. Barry as Second Assistant Resident in Radiology, beginning January 1, 1955;
Dr. Benjamin D. Canlas, Jr. as First Assistant Resident in Pathology for one year, beginning July 1;
Dr. Frederick C. Goetz as Chief Resident in Medicine, beginning January 1;
Dr. Philip H. Henneman as Assistant in Medicine, beginning January 1;
Dr. Herbert L. Kraut as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. John D. Leidholt as Assistant in Orthopedic Surgery, beginning January 1;

Dr. Richard A. Mayo as Assistant Resident in Orthopedic Surgery for one year, beginning October 1;

Dr. Jerome K. Merlis as Clinical Associate in Neurology, effective as of September 1, 1953;

Dr. Jule P. Miller, Jr. as Assistant Resident in Psychiatry for one year, beginning July 1;

Dr. Alex F. Müller, retroactively, as Intern in Medicine for the months of June and July 1950 and for January 1 through June 30, 1951;

Dr. David B. Murray as Second Assistant Resident in Pathology for one year, beginning July 1;

Dr. John O. Strom as Resident in Neuropathology for one year, beginning July 1;

Dr. Richard H. Watson as Assistant to the Children's Medical Service, beginning July 1;

Dr. Henry deF. Webster as Assistant Resident in Neurology for one year, beginning July 1;

Dr. Setrag A. Zacarian as Assistant Resident in Dermatology for one year, beginning August 1.

At their meetings during December and on January 6, the General Executive Committee voted:

To promote:

Dr. Leland C. Brannon to the position of First Assistant Resident in Neurosurgery for one year, beginning January 1;

Dr. Beverly W. Cobbs, Jr. from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. Zanvil A. Cohn from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Herschel D. Collins from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. Pierre M. Dreyfus from the position of Assistant Resident to that of Resident in Neurology for one year, effective July 1;

Dr. Daniel D. Federman from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Howard S. Frazier from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Lamont W. Gaston from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Herbert B. Locksley to the position of Second Assistant Resident in Neurosurgery, for the period January 1 through June 30;

Dr. David J. L. Luck from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Robert W. Mackie to the position of Senior Resident in Neurosurgery, for the period January 1 through June 30;

Dr. William L. Morgan, Jr. from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. Joseph R. Petranek from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. James A. Pittman, Jr. from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. Savitri Ramcharan from the position of Intern to that of Assistant Resident on the Children's Medical Service, effective July 1;

Dr. George S. Richardson to the position of Resident in Surgery, beginning January 1;

Dr. Harvey D. Rothberg, Jr. from the position of Intern to that of Assistant Resident in Medicine, effective July 1;

Dr. Yang Wang from the position of Assistant Resident to that of Resident in Medicine, effective July 1;

Dr. Donald N. Wysham from the position of Intern to that of Assistant Resident in Medicine, effective July 1.

To extend the appointment of:

Dr. Ernst Simon as Research Fellow in Biochemistry, from January 31 through March 31.

To reappoint:

Dr. Jacques Y. Chatillon as Clinical and Research Fellow in Medicine, for the period March 1 through July 31;

Dr. John Denovian as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning December 1, 1953;

Dr. Rodney H. Foss as Clinical Fellow in Radiology, for the period beginning January 1;

Dr. Joachim S. Gravenstein as Clinical and Research Fellow in Anesthesia, as of December 1, 1953;

Dr. John W. Irwin as Clinical and Research Fellow in Medicine, assigned to Allergy, beginning January 1;

Dr. Marc P. Moldawer as Clinical and Research Fellow in Medicine, beginning January 1;

Dr. Federico Mora as Second Assistant Resident in Neurosurgery, assigned to the Boston Veterans Administration Hospital, for the period January 1 through June 30;

Dr. William E. Reynolds as Clinical and Research Fellow in Medicine for one year, beginning January 1;

Dr. Bernard B. Stone as First Assistant Resident in Neurosurgery, assigned to Pathology, for the period January 1 through June 30;

Dr. Chiu-chen Wang as Clinical Fellow in Radiology, effective January 1.

To appoint:

Dr. Benjamin A. Barnes as Clinical Assistant in Surgery, as of December 1, 1953, with approval of his working in the Baker Memorial as Assistant to Dr. Robert R. Linton; it was further voted to approve the recommendation of the Tumor Clinic Committee that he be assigned as Clinical Assistant to General Surgery in the Tumor Clinic;

Dr. Leon Beauregard as Clinical Fellow in Radiology for one year, beginning July 1;

Dr. Leonard W. Cronkhite, Jr. as Clinical Assistant in Medicine, for the period of six months, beginning January 1;

Dr. Hermes C. Grillo as Clinical and Research Fellow in Surgery, beginning January 1;

Dr. John J. Hutchings as Clinical Fellow on the Children's Medical Service, beginning January 4, and as acting Out-Patient Resident, for the period March 1 through June 30;

Dr. Lowell W. Lapham as Research Fellow in Neuropathology for one year, beginning July 1;

Dr. Robert T. Long as Clinical Assistant in Psychiatry, effective January 1;

Mr. Norman M. Prentice as Research Fellow in Psychology, for the period December 1, 1953 through September 30, 1954;

Dr. John T. Sharp as Clinical and Research Fellow in Medicine, beginning December 1, 1953.

Brief bits:—

Dr. Benjamin Castleman has been appointed Professor of Clinical Pathology at the Harvard Medical School.

Dr. Edward D. Churchill has been named Chairman of the Division of Medical Services of the Armed Forces of the Hoover Commission.

Dr. T. Stewart Hamilton, past Assistant Director at M.G.H., has been named Director of Hartford Hospital, Hartford, Connecticut. Dr. Hamilton left Massachusetts General to become Director of the Newton-Wellesley Hospital, which position he has occupied until his new appointment.

Dr. Bernard M. Jacobson recently completed a series of six lectures in Postgraduate Hematology at the Greenwich Hospital, Greenwich, Connecticut.

Dr. S. William Levy (a.r.p. *D.* 1951) announces the opening of his office at 450 Sutter Building, San Francisco 8, California, for practice of diseases of the skin.

Dr. Paul D. White has been given the 1953 Scientific Award of the American Pharmaceutical Manufacturers' Association.

ORTHOPEDIC CLINIC

In previous News articles concerning the Orthopedic Service we have discussed research activities, teaching, care of patients in the Hospital, and other subjects. One problem which is receiving increasing attention and study at the M.G.H. is that of how to give the best medical service to ambulatory patients. (By the way, why don't we say walking patients? And why do we hear so frequently such solecisms as "he ought to be ambulated"? Will we live to see the day when residents are called ambulators and patients are classified as ambulatees or non-ambulatees?)

Through the doors of the Out-Patient Department there flows daily a stream of people seeking medical care. Many of them look upon the M.G.H. as though it were their physician, for this group has no family doctor. The Medical and the Children's Medical Services furnish most of the "family doctor" type of care. The physician in each of these clinics has not only the role of family doctor, but he is also a specialist in some particular field of medical care, whether it be in the uptake of radioactive iodine by the thyroid or in the interpretation of multilead electrocardiograms of the heart. It should be self-evident that all physicians are specialists, for no physician can be skilled in all aspects of diagnosis and treatment. It is time that we stopped using the word "specialist" in a derogatory sense. Limited interest, limited experience, and limited ability make specialists of all of us.

The walking patient with a disability involving the musculo-skeletal system who comes to the Admitting Desk of the O.P.D. has at his service a number of clinics. Sometimes it is difficult for the Admitting Officer to decide to which clinic the patient should be admitted. All of the OPD clinics are diagnostic clinics. Thus, a patient with a pain in the low back radiating into the leg may be referred to the Medical, the Orthopedic, the Neuromedical, or Neurosurgical Clinic. The diagnostic problem may be solved at the patient's first visit to one of these clinics, or, more likely, he will make two or more visits to several clinics and laboratories before the diagnosis is established. It becomes quite easy to decide which clinic should assume responsibility for treatment when a correct diagnosis has been reached. Patients with disabilities of the locomotor system are as a rule cared for in the Orthopedic OPD Clinic, but if there are special problems such as disabilities due to tumor, arthritis, infantile paralysis, scoliosis, or loss of limb he will be referred to the appropriate special clinic caring for these problems.

Until recent months the Orthopedic Clinic was kept open all day, every day during the week. It has always been difficult to adequately staff the clinic in the morning hours when ward rounds, operations, and other duties concerned with house patients take so much of the Resident and Visiting Staffs' time. At the suggestion of our Senior Resident, Dr. Tanner, we decided to try the experiment of seeing only emergency out patients in the morning and restricting the regular clinic to afternoon hours except for Saturday mornings. Patients are seen by the appointment system. Two visiting men and essentially all of the House Staff are present during the clinic hours. The Visiting Staff act as consultants and also see the "follow-ups" (patients operated upon while these doctors were on house service). Under the new system patients are seen more promptly, and the standards of care are perhaps better than they were previously because of the more careful supervision given by the Visiting Staff.

As a part of their Orthopedic OPD duties certain members of the Visiting Staff have accepted special assignments which enable them to study certain problems more carefully; for instance, Dr. Rowe supervises a "Shoulder Clinic" and Dr. Aufranc a "Hip Clinic".

There are two major special clinics for which the Orthopedic Service is responsible — Infantile Paralysis and Scoliosis. Patients in these clinics have long-term, even lifetime, disabilities. They need and get skilled, personalized, continued care. In addition to these clinics for which the Orthopedic Service is completely responsible we cooperate in the staffing of several other OPD clinics—the Hand Clinic, the Arthritis Clinic, the Tumor Clinic, and the Amputation Clinic.

The total number of hours which the Visiting and Resident Staffs devote annually to the care of walking patients has never been computed. It would be an interesting figure — a symbol which would inadequately suggest how much loyal service is freely given to MGH patients.

Joseph S. Barr, M.D.,
Chief of Orthopedic Service

New addresses:—

Dr. George F. Dwinell (*W.S.* 1917), 830 Beech St., Manchester, N. H.
Dr. Lawrence J. Essember (a.r.p. *C.M.* 1953), Beverly Hospital, Beverly, Mass.
Dr. Chester W. Fairlie (*W.M.* 1942), 85 Jefferson St., Hartford, Conn.
Dr. Robert G. Greene (a.r.s. *Or.* 1953), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Mr. Henry R. Guild (*Trustee* and *Treasurer of the Corporation*), 9th Floor, Old South Bldg., 294 Washington St., Boston, Mass.
Dr. James P. Hepburn (a.r.p. *An.* 1953), Milton Hospital, Milton, Mass.
Dr. Walter S. McClellan (*W.M.* 1925), University of North Carolina Medical School, Chapel Hill, N. C.
Dr. Thomas C. Peebles (*C.M.* 1952), Children's Medical Center, 300 Longwood Ave., Boston, Mass.
Dr. William P. J. Peete (*S.* 1948), Warrenton, N. C.
Dr. Burton C. Prior (clin. fel. *R.* 1953), Toronto Western Hospital, 399 Bathurst St., Toronto, Ontario, Canada.
Dr. John W. Ratcliffe (*W.S.* 1946), 111 St. Matthews Ave., San Mateo, Calif.
Dr. Stanley Sober (a.r.s. *Or.* 1953), Shriners' Hospital for Crippled Children, 1529 Cedar Ave., Montreal, Canada.
Dr. John B. Stetson (a.r.p. *An.* 1953), Lowell General Hospital, Lowell, Mass.
Dr. Earl M. Wedrow (r.p. *Psychiat.* 1953), Judge Baker Guidance Center, 38 Beacon St., Boston, Mass.

WE NEED YOUR HELP. Mail sent to several members of the MGH family has been returned to either the Office of THE NEWS or the Secretaries' Office, bearing such notations as "Unknown", "Unclaimed", etc. Ever since your editor took over the Directory section of the Annual Report in 1951, she has concentrated on trying to track down all such elusive individuals. Now when the time to prepare the 1954 Directory is near at hand, we have added to our own list of unknown addresses all those unknown in our Secretaries' Office and are appealing to you for help. If anyone can tell us anything concerning the address of any person listed below, such information sent to Cora F. Holbrook, Archivist and Editor of THE NEWS, will be most gratefully received. Here are the names, with last known addresses:

Adams, William B. (*E.M.* 1918), 280 Longmeadow, Longmeadow, Mass.
Alston, Edwin F. (*Path.* 1944), 274 Parnassus Ave., San Francisco, Calif.
Austin, Grace L. (r.p. *D.* 1930), 25 Albert Ct., Kensington, S.W. 7, London, Eng.
Barnett, Thomas B. (*M.* 1950), Strong Memorial Hospital, Rochester, N. Y.
Bennett, Warren (*M.* 1948), New England Center Hospital, Boston, Mass.
Bliss, Harry A. (*M.* 1945), Presbyterian Hospital, New York, N. Y.
Bloomer, Earl (*E.S.* 1917), 22340 Michigan Ave., Dearborn, Mich.
Bridge, Edward M. (*C.M.* 1927), Johns Hopkins Hospital, Baltimore, Md.
Brown, Ralph G. (*Path.* 1942), 722 Prospect Ave., Winnetka, Ill.
Caufman, Grace (*An.* 1939), 2300 Auburn Ave., Cincinnati, Ohio
Clark, George O. (*E.S.* 1904), 343 Beacon, Boston, Mass.
Collins, Richard, Jr. (*E.S.* 1933), 3812 S. 9th, Arlington, Va.
Edmonds, Henry W. (r.p. *Path.* 1942), 909 University, Seattle, Wash.
Freeman, Norman E. (r.s. *W.S.* 1935), 1435 4th Ave., San Francisco, Calif.
Fuldner, Russell V. (*Or.* 1939), 85 Trumbull, New Haven, Conn.
Ginandes, Shepard C. (*C.M.* 1952), 37 Mellen, Cambridge, Mass.
Gorman, Rosemary V. (a.r.p. 1945), New York Hospital, New York, N. Y.
Greene, Daniel C., Jr. (*C.M.* 1940), 263 South Ave., Weston, Mass.
Greenhill, Maurice H. (r.p. *Psychiat.* 1939), Duke Hospital, Durham, N. C.
Groves, Laurence K. (*W.S.* 1947), 578 New P.O. Bldg., Columbus, Ohio
Harter, John S. (*W.S.* 1935), 212 Brown Bldg., Louisville, Ky.
Hatch, Floyd F. (*E.S.* 1916), 699 E. South Temple, Salt Lake City, Utah
Higgins, Robert B. (a.r.s. *U.* 1951), 41 Cypress, Newton Centre, Mass.
Hills, Oscar W. (*M.* 1943), 403 7th, N.W., Rochester, Minn.
Holt, William L., Jr. (r.p. *N.* 1937), Westboro State Hospital, Westboro, Mass.
Hopkins, Charles E. (a.r.p. *C.M.* 1948), Johns Hopkins Hospital, Baltimore, Md.
Howard, Fred H. (*C.M.* 1949), Tulane University School of Medicine, New Orleans, La.
Howard, Herbert H. (*W.S.* 1914), 270 Commonwealth Ave., Boston, Mass.
Lewis, James (*W.M.* 1935 & *C.M.* 1936), Westfield State Sanatorium, Westfield, Mass.
Maughs, Sydney B. (a.r.p. *Psychiat.* 1938), 3720 Washington, St. Louis, Mo.
Miller, Milton L. (*E.M.* 1932), 337 S. Beverly Drive, Beverly Hills, Calif.
Musgrave, Rhoda U. (r.p. *Psychiat.,* McLean, 1937), Delaware State Hospital, Farnhurst, Del.
Newman, Elliott V. (*C.M.* 1941), Johns Hopkins Hospital, Baltimore, Md.
Ogden, Ralph T. (*C.M.* 1925), 179 Allyn, Hartford, Conn.
Rauh, Albert E. (*C.M.* 1936), Lyons, N. Y.
Roth, James d'A. (*M.* 1945), Regional Hospital, SHAAF, Salvia, Kan.
Schwyzer, Marguerite (a.r.p. 1946), Bellevue Hospital, New York, N. Y.
Seelye, Ralph H. (*E.S.* 1891), The Stonehaven, Springfield, Mass.
Shaw, Henry A. (*W.S.* 1891), 121 E. 31st, New York, N. Y.
Shaw, John L. (r.s. *P.H.* 1935 & *U.* 1937), 899 Madison Ave., Memphis, Tenn.
Steele, Byron W., Jr. (*a.r.s.* 1952), 108 Plymouth Rd., Needham, Mass.
Stiff, Donald W. S. (r.p. *R.* 1950), Williston, Vt.
Trowbridge, Ellsworth H., Jr. (a.r.p. *N.* 1940), 1102 Grand Ave., Kansas City, Mo.
Ulmer, Jack L. (r.s. *N.S.* 1942), 9112 Rose, Battle Creek, Mich.
Williams, David W. (*W.S.* 1943), 4 Chestnut, Springfield, Mass.
Young, Clark (*E.S.* 1923), Medical Arts Bldg., Salt Lake City, Utah

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report as soon as possible the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone for several months the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) classification of material, 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K., Keats, A. S., Mosteller, F., and Lasagna, L.
The effectiveness of oral analgesics (morphine, codeine, acetylsalicylic acid) and the problem of placebo "reactors" and "nonreactors".
J. Pharmacol. & Exper. Therap. 109:393-400.

Brewster, W. R., Jr., Isaacs, J. P., and Waino-Andersen, T.
Depressant effect of ether on myocardium of the dog and its modification by reflex release of epinephrine and nor-epinephrine.
Am. J. Physiol. 175:399-414.

Katzman, R., and Leiderman, P. H.
Brain potassium exchange in normal adult and immature rats.
Am. J. Physiol. 175:263-270.

Leiderman, P. H., and Katzman, R.
Effect of adrenalectomy, desoxycorticosterone and cortisone on brain potassium exchange.
Am. J. Physiol. 175:271-275.

von Felsinger, J. M., Lasagna, L., and Beecher, H. K.
The persistence of mental impairment following a hypnotic dose of a barbiturate.
J. Pharmacol. & Exper. Therap. 109:284-291.

Cardiology

Curti, P. C., Cohen G., Castleman, B., Scannell, J. G., Friedlich, A. L., and Myers, G. S.
Respiratory and circulatory studies of patients with mitral stenosis.
Circulation 8:893-904.

Owen, W. R., Thomas, W. A., Castleman, B., and Bland, E. F.
Unrecognized emboli to the lungs with subsequent cor pulmonale.
New England J. Med. 249:919-926.

General Surgery

Dwight, R. W., and Maloy, J. K.
Pilonidal sinus: Experience with 449 cases.
New England J. Med. 249:926-930.

Taylor, G. W., and Rogers, W. P., Jr.
Hindquarter amputation: Experience with eighteen cases.
New England J. Med. 249:963-969.

Laboratory Science

Bessman, S. P., and Lipmann, F.
The enzymatic transacetylation between aromatic amines.
Arch. Biochem. & Biophys. 46:252-254.

Jeanloz, R. W.
Polysaccharides d'intérêt physiologique: Les mucopolysaccharides du tissu conjonctif.
Chimia 7:292-293.

Jeanloz, R. W., and Jeanloz, D. A.
Ethers méthyliques et benzyliques de la glucosamine.
Chimia 7:233.

Jencks, W. P.
Discussion.
Federation Proc. 12:703.

Jones, M. E.
Discussion.
Federation Proc. 12:708-710.

Jones, M. E., Black, S., Flynn, R. M., and Lipmann, F.
Acetyl coenzyme A synthesis through pyrophosphoryl split of adenosine triphosphate.
Biochim. et Biophys. Acta 12:141-149.

Jones, M. E., Lipmann, F., Hilz, H., and Lynen, F.
On the enzymatic mechanism of coenzyme A acetylation with adenosine triphosphate and acetate.

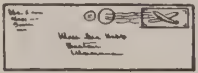
This is the last issue in which 1953 titles will appear, unless a 1953 book or a 1953 periodical carrying a title submitted to us did not reach our shelves before January 11, the deadline date for this issue of THE NEWS.



Another "singleton" has responded to our appeal for news concerning his present activities. This letter has come from Dr. Donald Macomber (*S.S.* 1911), from Brunswick, Maine.

In anticipation of retiring I had done a lot of exploring in Maine, both by land and by sea. Eventually, in 1939 I found a beautiful salt water farm here on Prince's Point, but the war prevented my final retirement until 1946.

I no longer do any professional work, outside of delivering a grandchild or two—the last, in July, was number seventeen. People sometimes ask me whether I miss practising and what I find to do. As to the first, it certainly is a relief to be able to sleep all night and to see something of my family and friends. As to the second, my only trouble is that I have too many hobbies. The chief of these is cruising along this best of all cruising grounds. In the yawl I have at present I have been as far as St. John, New Brunswick, and then up the St. John River, through the reversing falls to Fredericton. Four years ago I cruised in a somewhat larger boat, which I have since sold, to Halifax, Nassau, Key West, Havana, and points between. Three years ago we bought a French car and toured Italy, France, Belgium, Holland, Switzerland, England, and Scotland.

In addition to cruising by water I cruise by land in my house trailer. Winters, we have been to Mexico and Key West. I have been interested in color photography and as a result have many beautiful souvenirs of our travels. Recently I have taken up painting in water colors. While I don't expect to set the world on fire, I do find great satisfaction in riding this particular hobby.

At present I am building a house, of which I am architect and contractor.

Another letter from a "singleton"—this one from Dr. George W. Holmes, past Roentgenologist at M.G.H. and now an Honorary Physician on our Staff. From Belfast, Maine, he writes:

Although it is true that I am the only MGH physician in town, I am not the only MGH trained person here. We have had two nurses at the Waldo County General Hospital — Ruby Cameron and Grace Babcock, who received their training there.

Belfast is a city of about six thousand people. It was incorporated over one hundred years ago. The first settlers were of Scotch-Irish descent, and came here from New Hampshire in the year 1770. Belfast is beautifully situated on an arm of the Penobscot Bay, surrounded by a fertile farming country. In the early days it was a lumbering and shipbuilding center. Now it is the capitol of the Maine poultry industry. It has never, like so many towns on the Maine coast, become a tourist center. However, we do have a number of summer residents, so-called. Before my retirement I was one of them; since then we have made our former summer home into a year round residence. It is what was once known as a salt water farm, the owner depending upon both the land and the sea for his livelihood. The house, a small Cape Cod type, was built about 1800 and for many years was owned by men who were both fishermen and farmers. To a limited extent, I am carrying on their tradition.

We have a community hospital of forty beds. There are eight active physicians on our staff. The Clinical Laboratory and X-ray Department are well equipped and active. I spend three busy mornings a week at the hospital. This work allows me to keep in touch with present day medical problems and helps me to feel that I am not completely on the shelf.

We often wish that old friends were nearer and less difficult to reach, but, on the whole, time has been kind to us.

Dr. Roy H. Whitham (*W.S.* 1926), another "singleton", has sent us this nice informative letter:

Your letter to the "only MGH-er in town" came a few days ago and I am happy to answer your appeal for news. I'm afraid you have asked for trouble when you suggested we be expansive; you may use as much or as little of this as you see fit.

When I was released from active duty in the Navy in 1945 because of illness, I came back to Lincoln, Nebraska, where I had practised from 1926 to 1941. I hung out the old shingle again for the practice of General Surgery. It was so nice to be back again that I moved onto a farm near the city so that I could dig my roots in deeply and live up to my vow never to move again.

Lincoln, now a city of over 100,000, is a clean mid-western city with a large trade territory, some light industry, a lot of tradition, and pride in its Capitol and State University. There are very few really poor here and fewer rich, so that medically its people use private physicians and pay for their hospital services. I used to say that this region seemed to be the last stand of private practice, but perhaps the day has been saved by insurance and good times; at any rate, it is all private here. Medicine is highly specialized,

No. 45 in a series of Staff photographs
Dr. Morten Grove-Rasmussen—Director of the Blood Bank

with careful restriction of practice by the specialists the rule and the greater part of practice within the city done by specialists. General Surgery in our hands largely excludes the surgical specialties and is a narrower field than that which the West Surgical covered when I was House Officer. With the field thus restricted and the wonderful advances made in the last few years, surgery is a joy indeed and the old worries about one's patients are almost gone. Since the war, I have acquired two younger and highly qualified associates who add greatly to my freedom from professional chores and worries.

With medical practice so well organized and my children grown up, something had to be done to fill the vacuum of responsibility. After the war it seemed inadvisable to resume my former interest in medical organizations and civic activities. So I let my farming interest grow. We live in the country and operate some four hundred acres of Nebraska farm land, raising corn, alfalfa, grass, and cattle. We have a herd of Aberdeen Angus beef cattle and a small herd of Holstein Dairy cattle to eat the products of the land and keep us busy. A Nebraska farmer rarely dies of coronary disease, so perhaps I am neutralizing the effects of being a doctor for thirty years. I hope so.

My greetings to all old friends at M.G.H.

Another "singleton" heard from. Dr. Henry C. Thacher (*C.M.* 1942) writes:

I have been practising Pediatrics in the twin cities of Lewiston and Auburn for the past six years. We cover an area of approximately one hundred miles in south central Maine. Our Pediatric Ward is a thirty-bed unit, admitting from ninety to one hundred patients a month (rural and urban). We are the only Pediatric unit in Maine, at the moment, that is qualified for Resident training. The practice here in general is varied and interesting, and is a continuous challenge.

My only outside activities have been confined to helping in the organization of a Mental Health Association which is now functioning, and we hope, in the near future, to have a special clinic for Cerebral Palsy.

The Maine air is wonderful. Hobbies include playing with a five-months-old daughter and sailing along the coast of Maine whenever I can in the summer.

Best regards to all.

This nice letter has come from Dr. Horace K. Sowles (*W.S.* 1917):

Actually, I am not a "singleton", for my residence is in the town of Falmouth, Maine, but the mail happens to come through Cumberland Centre. There is quite a group of MGH men who reside in Falmouth and practise in Portland.

My chief interest is really in my farm, where my orchards and gardens keep me well occupied. In the winter I do wood carving and make reproductions of antique furniture in my workshop.

I do maintain a mailing address and office at 131 State Street in Portland, where I see consultations by appointment, only. Just how long I shall keep an office there I do not know.

The pace of life here is very comfortable and leisurely after the drive of many years at the M.G.H.

My very best wishes, and a cordial invitation to all my old friends at the General to drop in when they are in Maine.

This letter has come from Dr. Philip P. Thompson, Jr. (*W.M.* 1942):

Since leaving the General in 1946 I have been living in South Portland, although my office and practice is in Portland at 704 Congress Street.

I have had the good fortune to start practising with my father. As he was beginning to retire, it has worked out admirably for us both. He continues to practise and we use a common office.

My practice is limited to Internal Medicine, with special interest in Rheumatology. I am a member of the Visiting Staff of the Maine General Hospital and Eye and Ear Infirmary, as well as being on the Courtesy Staff of the Mercy and Portland City Hospitals. I am chief of the Arthritis Clinic at the Maine General and am assisted by Dr. Richard S. Hawkes (*W.M.* 1933). We organized the clinic in 1950 and have an active clinic at present.

In 1951 I became certified by the Board of Internal Medicine. My other medical duties consist of being Health Officer for South Portland, a director of the County T.B. Association, a member of the Health Council, a director of the local District Nursing Association, and chairman of the Medical Committee of the Maine Arthritis and Rheumatism Foundation.

My non-medical interests consist of fishing, gardening, keeping bees, raising apples, and struggling with the problems of raising four children. My only political activity was as a delegate to the State Republican Convention to try to insure Eisenhower's nomination.

A very attractive Christmas card and this most welcome letter have come from Dr. Chiu-an Wang (*W.S.* 1944):

This is just a brief note to tell you how much I have enjoyed receiving and reading The News, and that the Wangs have enjoyed being here in Hong Kong doing a good deal of surgical work.

A few months ago John Lloyd (*E.S.* 1944) was here for a visit. He came with his French bride from Tokyo. We had a wonderful time together comparing notes.

As I read The News I find rather frequently that MGH-ites have been around in this part of the world. I hope you will not forget to tell them to drop in at our house for a cup of tea when they pass by this port. We will be most delighted to meet them.

Kindest regards to our good friends at M.G.H.

We were very glad to receive this letter from Capt. Lincoln D. Clark, MC, USAR (*M.* 1948). His address is still 10th Field Hospital, APO 800, c/o Postmaster, New York, N. Y. Although his letter is dated December 8 and was sent by air mail, it did not arrive in time for his holiday greetings to appear in The News before Christmas. They are appreciated just as much now, however, for kind thoughts have no time limitations. His letter reads:

This is just a note to keep my MGH friends up on my present activities and location.

My military duty at present is as Chief of Neuropsychiatry Service, U.S. Army Hospital, Würzburg, Germany, and Psychiatric Consultant to the Würzburg Military District, which embraces a fairly large area of the U.S. Zone of Germany, extending northwest and west of Frankfurt to the Russian Zone of Germany.

I recently visited in Frankfurt with Capt. Dorr Hallenbeck, recently of the MGH Psychiatric Service and McLean Hospital.

Please give my best wishes for a Merry Christmas and Happy New Year to my associates at M.G.H. You can be sure I am anxious to be back in Boston.

THE NEWS

No. 132 Boston, Mass. March 1954

THE VINCENT MEMORIAL HOSPITAL

The Vincent Memorial Hospital became affiliated with the Massachusetts General Hospital as a Gynecologic Service in 1941. Its new building was opened in 1948 and it is now entering its sixth year in the new quarters. It has not as yet outgrown its present bed facilities, but the need for more office space is very evident. Its laboratory space has been increased by an addition, generously paid for by the Hyams Fund. Today it is evident to all of us that due to the researches of the Laboratory Staff, by opening new avenues of approach to certain problems, the available space will soon be too small to accommodate the obvious investigations that must be carried out. It is to be expected that, if researches are fruitful, the pathways of exploration widen. This is very true of this institution, and the direction in the future is a matter of concern to those of us involved.

A very satisfactory Postgraduate Course in Gynecology, under the direction of Dr. Francis M. Ingersoll, was given in September 1953. About forty practitioners from various parts of the United States and from other countries participated. The course was given by the members of our Staff, the Staff of the Massachusetts General Hospital, and by gynecologists from other Boston hospitals. This course is now a regular part of our teaching program and will be given again next year.

The teaching of Harvard Medical students is carried out both on the wards and in the Out-Patient Department, with the Resident Staff and a member of the Visiting Staff always present. We feel our Out-Patient Clinic is a successful one.

A Department of Gynecology has always been considered to consist of those interested in the study of diseases of the female pelvic organs, but Dr. George P. Berry, Dean of the Harvard Medical School, Dr. Dean A. Clark, General Director of the Massachusetts General Hospital, Dr. Edward D. Churchill, John Homans Professor of Surgery at Harvard Medical, and especially Mr. Louis Curtis, Chairman of the Vincent Memorial Hospital Trustees, considered it their obligation to adopt a much broader viewpoint in relation to the new Vincent Memorial Hospital. The constitution of the Hospital states that its aim is the care of the diseases of women and that the object must not be directed entirely toward pelvic disease. Certainly this broad outlook will be a happy one to convey to the future Chiefs of Gynecology in the Massachusetts General Hospital. The aim of the Vincent has since its foundation been directed toward the care of women. Gynecology on the whole has obviously broadened and includes, besides pelvic surgery in women, radiology in a limited sense, endocrinology, and psychosomatic medicine. This concept is better than the former narrow field, but surely any future Chief should be expected to look even further, for there are many lesions—breast, thyroid, and adrenal, to mention only a few—that must be the concern of the broadly trained gynecologist. It is our hope that this wide point of view will always be the goal of the Chief of Gynecology of the Vincent Memorial Hospital.

As is to be expected in any institution whose duty it is to train surgeons and gynecologists, certain key members of the Staff must leave for more responsible positions. Dr. Langdon Parsons, long a member of the Surgical Staff of the Massachusetts General Hospital and of the Vincent Memorial Hospital Staff, is now Professor of Gynecology at Boston University. Dr. Somers H. Sturgis is now Associate Clinical Professor of Gynecology in the Harvard Medical School and Chief of Gynecology at the Peter Bent Brigham Hospital. Dr. John McL. Morris, a former member of the Vincent Staff, is now Associate Professor of Gynecology at Yale University.

Since the opening of the Vincent at the Massachusetts General, Dr. Sturgis and Dr. Meigs have produced volumes I and II of *Progress in Gynecology.* This book has recently been translated into Spanish. I have seen it in many doctors' offices and hospitals in many countries—evidence that it has been a valuable contribution to gynecologic literature. Within the next year it is hoped that volume III will be well under way toward publication. This year Drs. Parsons and Ulfelder have produced a real classic of gynecologic surgery. It is called *The atlas of pelvic operations* and is illustrated by Miss Mildred Codding. It is clear from its popularity that this book is a most needed guide to the surgery of the pelvis. The operations described are those accepted and used in the Vincent Memorial Hospital and in Dr. Parsons's Service at Boston University. At this writing a new book, *The surgical treatment of cancer of the cervix,* is in press, to be published by Grune and Stratton. This book—a compilation of the writings of those who know this phase of the work best—will fill a great void, for there is no such book in existence. Twenty authors—seven of them from our Hospital—have contributed. There are contributions from most parts of this country and from Holland, Austria, and India. Our Hospital has contributed greatly to the renaissance of the radical surgery of cancer of the cervix and our results bear out the value of such procedures. There are other books in preparation, and if this sort of interest means anything, we feel that we have partly justified our existence. There have been many publications from the Hospital in the various medical journals on cancer of the cervix, uterus, and ovary, and studies on endometriosis, fibromas of the ovary with fluid in the chest and abdomen, the Stein-Leventhal syndrome, sterility, and many other allied subjects. All of our Staff members are active in investigations in both laboratory and clinical research.

Dr. John B. Graham is carrying out a yeoman service with the help of volunteers. He has been classifying all tumors and looking up the end results on all of our cases of malignant disease of whatever category. Soon it will be possible for us to report the five-year results of any tumor, in any stage, treated by surgery or radiation. This should establish a basis from which we can decide for or against any new method of approach. The catalogue will go back to 1927 and will be maintained currently. Such a follow-up should please such stalwarts as Dr. Ernest Amory Codman, a pioneer in the End Result campaign, were he only here to witness it. Besides doing this most necessary piece of work, the Grahams—John B. and Ruth M.—have, as Directors of the Vincent Memorial Research Laboratory and the Cytology Laboratory, respectively, continued their extraordinary researches into radiation response, its sensitivity, and its resistance. This piece of work, going on for eight years and utilizing slides from thousands of patients and untold numbers of experimental animals, is at the point where their study of cases is acceptable to a joint committee of the Radiology and Gynecology Departments, and on February 1, 1954 a new regime was established to study patients and decide by cytologic methods whether a patient should be radiated or operated upon. Our two Departments are in complete agreement on the problem, and the choice of treatment —radiologic or surgical—will be decided upon the Grahams' researches. Their work indicates that they can determine from stained vaginal smears whether a patient is resistant or sensitive to radiation. To our great joy this is to be a combined study, and a real endeavor will be made to instruct the radiologist and the gynecologist in the proper method of treatment. It is fortunate that through the generosity of the American Cancer Society and through the helpfulness of Dr. W. Jason Mixter, Trustee of the Proctor Fund, Dr. and Mrs. Graham of our Department and Dr. Milford D. Schulz of the Radiology Department had the privilege of spending some months in 1952-1953 in Sweden, to watch the treatment methods of the Radiumhemmet under the auspices of Dr. Hans L. Kottmeier. They saw other clinics, learned other methods, but have chosen a method similar to the Stockholm approach to use in the treatment in this series of cases. It is hoped that this whole plan will be adopted by others in our city, so that a greater number of cases may be studied and a greater number of those who are interested may be instructed in the method of attack. If the Grahams' beliefs were proved there would be no necessity for this experiment. Inasmuch as there is so little choice between surgery and radiation in the treatable cases, no harm can be done by selection of patients for one or the other form of treatment. The Grahams' publications describe the method by which the selection is made. In this report it is sufficient to say that certain basal cells in the vaginal smear show dark basophilic staining and fine vacuolization in the cytoplasm. A large percent of these cells indicates a probable good response to radiation; a lack, a poor response. The finding of such cells indicates that the patients have a sensitization response, or, for short, are said to have good S.R. It has been found that by means of testosterone and alpha tocopherol the population of these cells can be raised, changing a poor response into a good one. After the first part of the treatment by radium, the smears are watched for a response in the normal vaginal cells. In response to radiation the normal cells swell, become exfoliated, and assume bizarre shapes. If this response is present in sufficient amount the patient will be continued on radiation therapy; if not, she will be operated upon. We await with great interest the beginning and outcome of this experiment to intelligently select patients for cancer therapy. This is a recognized and much-needed test.

Besides this important study, Dr. and Mrs. Graham have a full and well-rounded attack planned on the problem of cervical cancer which should later be of value in the whole cancer problem.

In our laboratory Dr. Janet W. McArthur has made a very important discovery. For the first time a satisfactory and new hormone assay for the interstitial cell-stimulating hormone of the pituitary gland can be done, utilizing the ventral prostate of pituitarectomized mice. With this definite test to use, the whole problem of ovulation can be much better attacked, and normal and abnormal menstrual cycles studied. Dr. McArthur is helped from the clinical side by Dr. Ingersoll. It is our opinion that between them many difficult menstrual problems can now be better understood, and it is within the realm of possibility that the solution of the problem of ovulation and all that that means to many women, sterile and otherwise, may be solved.

Due to the excellence of these researches and the great vistas that they open, it is clear to me that additional space may be necessary for more technicians, fellows, and laboratories. The patient space is satisfactory as of today, but what these new investigations will bring about it is not possible to state.

The residents, who in their surgical training have a year in this atmosphere, are—we hope—much better able to serve the communities with safe and solid Gynecology than ever before. We would like more ward patients and more beds, but perhaps the size of our unit is what makes it possible to accomplish all we have done. We all feel that the Vincent has proved itself.

Joe Vincent Meigs, M.D.,
Chief of Gynecology Service

THE VINCENT SHOW

Announcement comes from the Vincent Club that the members are producing their annual Show for the benefit of the Vincent Memorial Hospital this year from March 24 through 27 at 8:30 each evening, with a matinee Saturday afternoon at 2:30. The Show will be given again at New England Mutual Hall, where the many small tables and varied refreshments make the occasion so congenial.

"A fig for a fancy" is the name of the original musical story written by Mrs. C. Campbell Patterson. The locales of the different acts promise to be most varied, and the amusing plot will be spiced with a great deal of music and dancing.

The provisional members and advertising committee of the Club have already secured over $24,500-worth of advertising for the program.

Tickets will go on sale on Monday, March 8, and the box office at New England Mutual Hall will be open thereafter Mondays through Fridays from 9:30 A.M. to 5:30 P.M. and on Saturdays from 9:30 A.M. to 1 P.M. Tickets range in price from $1.25 in the balcony to $5.00 for seats at tables. The box office telephone number is COpley 7-3535.

Dr. Madelaine R. Brown, Associate Neurologist on our Staff, was one of nine women physicians recently honored by the New York Infirmary with the Elizabeth Blackwell Citations. Dr. Brown was cited "for her work in neurology".

The Board of Trustees, at their meeting on January 22, voted:

To accept the resignation of Dr. Marianne R. Johnson, Assistant Anesthetist, effective February 7;

To rescind the appointment of Dr. Bernard Loitman as Assistant Resident in Radiology, as of July 1.

To promote:

Dr. Ernest A. Sneddon from Assistant Resident to Resident and Assistant in Anesthesia, as of November 1, 1953.

To appoint:

Dr. Barbara M. Orski as Intern on the Children's Medical Service for one year, beginning July 1;

Dr. Orjan T. G. Ouchterlony as Visiting Bacteriologist pro tem, effective as of January 11.

At their meetings on January 13, 20, and 28, the General Executive Committee voted:

To rescind the appointment of Dr. William E. Gatlin as Clinical Fellow in Radiology.

To reappoint:

Billy Baggett, Ph.D. as Assistant in Biochemical Research in Medicine, effective as of November 1, 1953;

Arnold F. Brodie, Ph.D. as Research Fellow in Biochemistry, effective September 1, 1953;

Dr. Jonathan B. Gill as Clinical Assistant in Psychiatry, for the period January 1 through June 30;

Dr. Teruyoshi Hashiba as Clinical and Research Fellow in Neurosurgery, effective February 1;

Dr. Theodore F. Hueter as Research Fellow in Physics, assigned to Neurosurgery, for one year, beginning January 1;

Theodore O. Macklin, A.B. as Research Fellow in Psychology, through June 30;

Dr. Henry Neiditsch as Fellow in Anesthesia for one year, beginning September 1;

Gershen Rosenblum, M.A. as Research Fellow in Psychology, for the period January 1 through September 30;

Dr. Ruth Weiss as Clinical Fellow in Psychiatry, for the period January 1 through June 30.

To appoint:

Dr. Daphne S. Anderson as Research Fellow in Dermatology for one year, beginning December 1, 1953;

Christine T. Bothner-By, Ph.D. as Research Fellow in Medicine, effective as of January 20;

Dr. Williams Cochran as Clinical Assistant in Orthopedic Surgery, with the privilege of assisting Dr. Otto F. Aufranc in the Baker Memorial and Phillips House, effective as of January 13;

Dr. Albert Heyman as Clinical Fellow in Neurology for six months, beginning January 1;

Dr. Pierre Johannet as Clinical Fellow in Psychiatry, beginning January 1;

Dr. Vernon H. Mark as Clinical and Research Fellow in Neurosurgery, for the period January 1 through June 30;

Dr. Kalervo A. Ohela as Research Fellow in Medicine, effective January 1;

Dr. Dieter Schmid as Research Fellow in Medicine for one year, beginning February 1 or soon thereafter;

Michael C. Schotz, Ph.D. as Research Fellow in Medicine, effective as of January 4;

Dr. Heinz R. Schroeder as Research Fellow in Neurosurgery, for the term January 1 through October 31;

Dr. Gordon B. Smith as Clinical Fellow in Medicine, for the period February 1 through April 30;

Irving Wolf, Ph.D. as Research Fellow in Psychiatry, assigned to Anesthesia, beginning January 1.

MASSACHUSETTS EYE & EAR INFIRMARY

Dr. Ramaiyer Gouri Shankar and Dr. Michel Neveu are among the new arrivals at the Infirmary. Dr. Shankar has come to the ENT Service from his home in India. Since his arrival on January 8 he has spent his time in the Mosher Laboratory where he is studying for three months of his three-year residency.

Dr. Neveu was appointed a Fellow in Otolaryngology in December of last year. His study here is made possible through the exchange visitors program of Harvard University and a French Government fellowship. While in Paris, Dr. Neveu was the assistant to Professor Aubry. At present, he is also attached to the Mosher Laboratory.

Two Infirmary doctors have recently completed their residencies:

Dr. Yunis M. Sa'eed specialized in Otolaryngology and ended his training on February 24. He plans to fly to his home in Iraq, but to return to the States later.

Dr. William Lincoff completed his residency in Ophthalmology on February 1. At present he is practising at 317 East 9th Street in Chester, Pennsylvania.

Dr. LeRoy A. Schall attended several sectional meetings of the American Laryngological, Rhinological, and Otological Society, of which he is president. The different sections of the meetings were held in New York City on January 8; in Louisville, Kentucky, on January 16; in St. Louis, Missouri, on January 17; and in Portland, Oregon, on February 6.

From February 21 to 25 Dr. Schall attended the Third Latin American Congress of Otolaryngology, held in Caracas, Venezuela, where he presented, by invitation, a paper on "The indications, techniques, and results of total laryngectomy".

Dr. Paul A. Chandler went to the Virgin Islands recently, to take part in a Symposium on Cataract Surgery. He was accompanied by Drs. Howard Hill from Waterville, Maine, and William B. Clark from New Orleans, Louisiana. All three were in Havana on January 15 and San Juan on January 27, to participate in the lectures sponsored by the Pan-American Society of Ophthalmology.

The Institute of Pastoral Care has already issued its folder describing the summer school courses in Clinical Pastoral Training to be given in 1954. Information concerning the locations of these schools and their courses may be procured from Rev. James H. Burns, Chaplain Supervisor of the courses given here at Massachusetts General Hospital each year.

* * *

VOLUNTEER GROUP

MGH STAFF WIVES HOSPITAL COMMITTEE

The Staff Wives Music Committee, under the able direction of Mrs. Abraham L. Finesinger, is continuing its program of concerts for patients twice monthly in the MGH Chapel.

On Wednesday, February 17, the Winchester Trio—Adelaide Crowell Felmet, violin; Barbara Segerstrom, cello; Lucy Wilcox Cushman, piano—gave a program of light classics. The February 24th program presented Frances Lawrence, soprano, and John Woodworth at the piano.

On Tuesday, March 9, Phyllis Hardy Blodgett, contralto, will offer a selection of songs, with Shirley J. Norwood her accompanist.

Gladys de Almeida, soprano, will sing for the March 24th concert, accompanied by Mrs. Seth Turner Crawford, harpist.

The first tea of the new year for visitors from abroad and their families was given in the Medical Staff Room of the Bulfinch Building on Thursday, February 4. As usual, an enthusiastic group of staff and visitors attended the tea, during which all became better acquainted with one another.

Mrs. Grant V. Rodkey asks all who may know of available apartments to please notify her. She has many requests from visitors to help them get located. Mrs. Rodkey's telephone number is BElmont 5-6310.

CHEMISTRY LABORATORY

While delving into our MGH archives for the history of the Chemistry Laboratory we found that two years ago we must have had our 100th birthday, since it was in 1852 that our first Chemist to be listed as such was appointed. He was Dr. John Bacon, and he served the Hospital as Chemist until 1863, when he was obliged to resign because of ill health and the stress of his duties at the "Medical College". He was succeeded by a Dr. James C. White, who turns out to be our own "J.C." 's grandfather. In *Sketches from my life* by the earlier Dr. White we find that the year after his graduation from Medical School he was appointed an instructor in chemistry there and later was made Chemist to the Massachusetts General Hospital. He states that he "took charge of the students who cared to study Chemistry practically, both qualitative analysis and the examination of the urine". The present-day first year student in the throes of biochemistry at the Medical School must indeed regard those as "the good old days". Dr. White served for eight years, at which time he left to study dermatology in Vienna. It is comforting to note that he lived to the good old age of eighty.

Dr. White was succeeded by Dr. Edward S. Wood, who served as consultant from 1872 to 1905 and did all his work at the Medical School.

In 1896, shortly after the opening of the Clinico-Pathological Laboratory building, the need of a chemist here at the Hospital was felt and a chemical laboratory was provided on the third floor of the new building. The laboratory was later increased in size by the addition of a room over the carpenter shop in the then new Power House. As these two buildings were adjacent, a door cut in the partition wall made the laboratory rooms continuous. In 1897 Dr. Franz Pfaff was appointed as "Chemist, Clinical Laboratory". In 1899 his title seems to have been increased to "Chemist, Clinico-Pathological Laboratory", which position he held until 1904. No comment is made as to a change of duties to go with the lengthened title.

Dated February 8, 1906, the following letter was addressed to the Trustees from Dr. Arthur T. Cabot:

> At the Massachusetts General Hospital a man thoroughly expert in biological chemistry is greatly needed. Work of the greatest interest and importance might be done there and the opportunity is now going to waste for the lack of some good man to put it to use.
>
> If it were possible to spend about $3,000 a year on the chemical laboratory at the Massachusetts Hospital, we think we could obtain a man who would do satisfactory work there. Doubtless, if he proved as good a man as we expect, he would, in a year or two, wish to enlarge the opportunities of his laboratory by having adequate assistance, and probably before a very great while it would be necessary to raise his salary somewhat to hold him.
>
> We feel that there is no direction in which money could be spent to better advantage in connection with the work at the hospital. . . .
>
> The pathological laboratory would be greatly helped and its work made more thorough and more comprehensive by the association of a first rate chemist in the same building.
>
> We earnestly recommend, therefore, the appropriation of sufficient money to justify the employment of an efficient chemist. . . .

The "efficient chemist" appointed was Dr. William F. Boos, who held the position until he resigned in 1912. At this time Dr. Walter W. Palmer, later the distinguished Professor of Medicine at Columbia University and Chief of the Medical Service at the Presbyterian Hospital in New York, and Dr. L. Harry Newburgh, who later became Professor of Medicine at the University of Michigan, "carried" the Chemical Laboratory for a while under the supervision of Prof. Lawrence J. Henderson of the Harvard Medical School.

In 1913 Dr. Otto Folin was appointed Chemist, with Dr. Willey Denis Assistant Chemist. Dr. Denis was, incidentally, the first woman elected to the Staff of the Hospital. Dr. Folin acted only in a consulting and supervisory capacity and never made his headquarters at the Hospital.

Dr. Denis resigned in 1920 and Dr. James L. Stoddard was then appointed Chemist, with Dr. Folin serving as Consulting Chemist. Dr. Stoddard did his work in the new Chemical Laboratory on the third floor of the Bulfinch Building, provided when the east wing of that building was reconstructed in 1925.

There is a note in the records under 1924 which states: "One of the important practical results of the year has been the discovery of the cause for the rather frequent, harmful, and often serious reactions from the giving of intravenous glucose, which has resulted in the almost complete abandonment of this mode of treatment. Other work, as yet unfinished, includes investigations of blood proteins, and certain problems in the distribution of physiological substances of the body. The routine work for the year comprised the study of 5,366 specimens."

And under 1927 comes this note of particular interest: "During the year a beginning was made of the study of Na, and K, in relation to normal physiology and disease, and an electrolytic method was devised for the determination of Na and K", and the present laboratory staff might well add that the study is still being vigorously pursued! Among other things, Dr. Stoddard left the laboratory an excellent method for the measurement of blood fatty acids, which method is the one still used here.

In 1922 Miss Clara Durgin, a Massachusetts Institute of Technology Graduate in Chemistry, came on and served most ably under Dr. Stoddard. The laboratory thrived and under Miss Durgin's excellent supervision, which began in 1929, passed many of the city's future researchers, including Dr. Ropes in her premedical school days.

Notes in the record then state that in 1937 the laboratory turned out almost 19,000 determinations, and in 1938 the following note is made: "The importance of the Laboratory has increased tremendously in the past 25 years. Knowledge concerning abnormal blood changes and chemical faults within the body has done much to aid the clinician in the interpretation of illness and in the correction of these disturbances." For the same year it is noted that Dr. Means asked Dr. Fuller Albright to supervise the Chemistry Laboratory at "zero salary", and the record goes on to say: "He pointed out that he was not a chemist." We don't know whether Dr. Means was doing the pointing out or whether Dr. Albright was being modest, but the record continues: "However, it turned out that what was wanted was a go-between between Miss Durgin who was a Chemist, and the clinicians who would constantly be demanding various analyses." Then, when Dr. Sulkowitch came to work on research with Dr. Albright, he "lent a hand on the supervision of some of the tests being carried out by the Chemistry Laboratory."

In 1939 Miss Durgin left to work in food analysis at M.I.T., but she returned to the Chemistry Laboratory in 1950 as Secretary, which position she now holds and, with her background, is of inestimable value.

For a couple of years following Miss Durgin, Dr. Eunice Moore took charge, but left to enter industry in 1943. Following her departure, due to an acute shortage of trained personnel, the laboratory went into a tail spin and reorganization again took place.

In 1944 Dr. Allan M. Butler, Chief of the Children's Medical Service and an excellent chemist, was appointed staff physician in charge of the Chemistry Laboratory. Two more rooms, plus some much-needed new equipment, were added to the physical set-up. Margaret Rourke, schooled for three years under Drs. Butler and James L. Gamble as Clinical Chemist at the Children's Hospital, plus seven years on the MGH Surgical Research Service and a tour of duty with the Army as added fortification, was set loose on the fourth floor of the Bulfinch. A long, hard pull followed but the laboratory grew slowly in the services it offered the Hospital, which soon included a 24-hour day, 7-day week coverage provided by the regular daytime crew, which is concomitantly making the diagnosis of diabetic acidosis an ominous one and prompting the choice of "The sugar blues" as the laboratory theme song.

The laboratory also opened its facilities to the various research groups in the Hospital, who then sent in huge numbers of determinations by contract, including several complete metabolic studies from Ward 4.

By 1950 the determination load per year had not only more than doubled its 46,000 of 1944 but had quadrupled its variety, and the walls were practically pushed out for lack of space to work in.

In the summer of 1951 Miss Rourke left in pursuit of more education, accepting a teaching fellowship in biochemistry at the Tufts Medical School, and, again, reorganization ensued. No longer did it seem advisable to have the day crew serve for 15 or 18 hours of continuous duty to cover emergencies, so adequately trained personnel were added to the group for night and Sunday coverage. Active plans were made to move the laboratory to more workable quarters in the Domestic Building, to increase the personnel, and to restore the laboratory to its previous dignity of having a physician-chemist in charge—not merely as a go-between and consultant, but as an active participator in the work of development of the laboratory activities and with his office in the laboratory suite. Dr. Charles H. DuToit was selected as being just the man, having completed the full run of duty on the Medical House Staff, plus having worked with Dr. Hastings at the Medical School and Dr. Lipmann at the M.G.H. He went on active duty in the Chemistry Laboratory in September 1952 and at the same time Miss Rourke, with her head full of chemistry, rejoined the team. The Chemistry Laboratory was then made a part of the Medical Department, under Dr. Bauer, and exactly a year later moved to its new quarters on Domestic 3, and was again bolstered up with some much-needed equipment.

A steady stream of workers from other countries continues to pass through the laboratory and will, we hope, carry a few pearls back to their native lands.

The laboratory should continue to grow and to offer increasing service to the Hospital and the physicians connected with it.

We live on Domestic 3. Come up and see us some time!

G. Margaret Rourke, M.S.,
Research Associate

Brief bits:

On February 1, Dr. Walter S. Burrage addressed the American Academy of Allergy in Houston, Texas, during its Tenth Annual Meeting. His subject was "Effects of histamine and epinephrine on the small pulmonary blood vessels of living rabbits". This paper was illustrated by a 16 mm colored motion picture film. The paper and motion picture were prepared by Drs. Burrage, J. W. Irwin, J. I. Gallemore, and D. M. K. Wang. On the same day, Dr. John W. Irwin addressed the same group on the subject "Maintenance cortisone in intractable asthma: Preliminary observations of undesirable cortisone effects". This paper was prepared by Drs. J. W. Irwin, P. H. Henneman, D. M. K. Wang, and W. S. Burrage.

Dr. Earle M. Chapman delivered two lectures during the month of February. On February 6 he addressed the Student Seminar on the Modern Therapy of Hyperthyroidism at the University of Maryland; on February 22 he gave a lecture at the Atlanta Graduate Medical Assembly in Atlanta, Georgia.

Dr. Alastair J. Gillies is now an Assistant Professor of Anesthesia. His address is Strong Memorial Hospital, Rochester, N. Y.

When Dr. Walter G. Phippen retired last year as President of the Staff of the Salem Hospital, the Trustees and Staff of that hospital presented him with an order to have his portrait painted. This was done bv Harry Sutton of Andover, and the portrait has been on exhibition at the Guild of Boston Artists.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it.

Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiology

Sprague, H. B., and Ongley, P. A.
The clinical value of phonocardiography.
Circulation 9:127-134.

Dermatology

Lever, W. F., Smith, P. A. J., and Hurley, N. A.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. I. Clinical data and analysis of the plasma lipids.
J. Invest. Dermat. 22:33-51.

Lever, W. F., Smith, P. A. J., and Hurley, N. A.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. II. Analysis of the plasma proteins and lipids by means of electrophoresis and fractionation of the plasma proteins; effects of high speed centrifugation and of extraction with ether on the plasma proteins and lipids.
J. Invest. Dermat. 22:53-69.

Lever, W. F., Smith, P. A. J., and Hurley, N .A.
Idiopathic hyperlipemia and primary hypercholesteremic xanthomatosis. III. Effects of intravenously administered heparin on the plasma proteins and lipids.
J. Invest. Dermat. 22:71-83.

Swartz, J. H.
Classification of fungi. (Chart)
In Handbook of Tropical Dermatology and Medical Mycology, vol. 2, R. O. G. Ph. Simons, Editor, Amsterdam, Holland, Elsevier Publishing Company, p. 1014. (1953)

Swartz, J. H.
Physiology of fungi: Growth and reproduction.
In Handbook of Tropical Dermatology and Medical Mycology, vol. 2, R. O. G. Ph. Simons, Editor, Amsterdam, Holland, Elsevier Publishing Company, pp. 1028-1032. (1953)

General Medicine

Albright, F., Henneman, P., Benedict, P. H., and Forbes, A. P.
Idiopathic hypercalciuria: A preliminary report.
Proc. Roy. Soc. Med. 46:1077-1081. (1953)

General Surgery

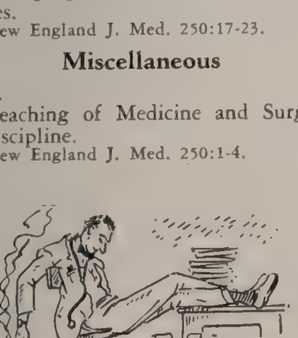
McDermott, W. V., Jr., and Adams, R. D.
Episodic stupor associated with an Eck fistula in the human with particular reference to the metabolism of ammonia.
J. Clin. Investigation 33:1-9.

Surgery—Reconstructive

Cannon, B., and Murray, J. E.
Medical progress—Plastic Surgery: Facial injuries.
New England J. Med. 250:17-23.

Miscellaneous

Cope, O.
The teaching of Medicine and Surgery as one discipline.
New England J. Med. 250:1-4.



BIOGLETS

Dr. Norman R. Bernstein, Assistant Resident in Psychiatry—born in New York City, October 12, 1927; U.S. Army: Valley Forge General Hospital, 1946-47; B.A., Cornell University; M.D., New York Medical College, 1952; Intern, Flower-5th Avenue Hospitals, 1951-52; Resident in Psychiatry, Kings County Hospital, Brooklyn, N. Y., 1952-53; married; home: New York City.

Dr. Julio Toriello, Assistant Resident in Radiology—born in Guatemala City, Guatemala, January 16, 1923; Bachelor in Sciences and Letters, National Institute, Guatemala, 1940; Bachelor in Medical Sciences, Universidad de San Carlos, Guatemala, 1944; M.D., Escuela Medicine, Universidad de San Carlos, 1951; Intern, Hospital General de Guatemala, 1951-52; Clinical Fellow in Radiology, Massachusetts General Hospital, 1952-53; military service: Assimilated Mayor to the Guatemalan Army; married; one son.

Dr. Jan Wolff, Intern in Medicine—born in Düsseldorf, Germany, April 25, 1925; school in Holland, 1935-37; came to the United States, 1937; A.B., University of California, 1945; M.A., University of California, 1946; Ph.D., University of California, 1949; M.D., Harvard Medical School, 1953; permanent address: San Anselmo, California.

♣ ♣ ♣

The new tennis court near Bartlett Hall, which was in almost constant use for tennis up to cold weather, was then flooded for skating. We wish we might have secured a motion picture, in color, of the attempted serpentines and roslos and islis circle 8's which we witnessed on a few occasions—to say nothing of some ultra-dramatically executed spills!

♣ ♣ ♣

A subject of paramount importance with some writers and speakers still continues to be "To split or not to split"—the infinitive, we mean. For more than five years we have been hoping that available space in THE NEWS would permit us to submit our credo to this ever-active symposium.

To state our stand briefly—it seems to us that the English-speaking world is sharply divided into two distinct groups: the non-splitters (which, incidentally, tend to include also the shall-ers and the that-ers—but those are separate subjects, and not for now), and the splitters (together with the will-ers and the which-ers). It matters not to the first group that many of the old arbitrary rules of writing and speaking have become outmoded. It matters not to them that all of us have extricated ourselves from most of the subjunctive mood shackles that were clamped tight round our writing hands up to a few years ago. It matters not to them that "I don't think that . . ." is not only allowable now, but is used by most careful scholars today, when only a short time ago such an expression was tantamount to grammatical heresy. We remember when, once, we stood alone before a well-known English professor, armed only with our strong conviction on this subject, and fought down to a victorious finish such futile arguments as "It is incorrect to say you 'don't think', because you *are* thinking either consciously or subconsciously every moment of your existence." He would not admit at first that there was a difference in meaning between "I don't think it will rain today" and "I think it will not rain today"—would not admit to a meaning of doubt about the outcome of the weather inferred in the first expression, but eliminated in the second by a positive statement regarding rain. Our counterattack was, "Then a whole category of similar verbs must be included in your rule. For instance, 'I don't live in Chicago' or 'I don't breathe as easily when . . .'—all such expressions are incorrect according to your argument, because I *do* live all the time (so far) and I *do* breathe all the time." Finally, to our own satisfaction and the professor's reluctant admission, that particular rhetorical ogre went down to defeat.

But back to this split infinitive subject. In all seriousness, it seems to us to be no more heinous a crime to separate a verb from its *prepositional* auxiliary than from its *verbal* auxiliary, the latter of which has always been acceptable. Who would ever quibble over "I shall promptly send you my check", with the "shall send" divided? But who among the non-splitters would subscribe to "I shall arrange to promptly send you my check", with the "to send" separated?

It is true and understandable that each of us has his own particular sensitivities concerning written or spoken expressions, and we are no exception. For instance, we writhe every time we hear or read that generally used but utterly ungrammatical phrase, "Tell us in 25 words or less why you . . .". And we are quite willing to allow the non-splitters their writhing privileges whenever they encounter a split infinitive. It is also true that we would not go out of our way, armed with a razor-edged ax, hunting for infinitives to split. But it does seem to us that a smoothly running sentence is more important than to forfeit euphony for the sake of adhering to a debatable rule in Fowler, or wherever.

This might be a good time to recall Sir Winston Churchill's delightful rejoinder to the editor who had blue-penciled one of Sir Winston's sentences which he had ended with a preposition. You may recall that his retort was something like, "This is the sort of thing with which I will not put up." In contrast to this, we remember an incident that occurred not so long ago. The writer of an article for publication had called upon three careful readers to comb his material for any possible errors, after which he gave it his own last grooming. With horror on his face and in his voice he said to us, "Just imagine it! After all that checking and rechecking, I found one split infinitive!"

However, whether you are a splitter or a non-splitter, we believe you will enjoy reading a classic on the subject that appeared in the *Saturday Review* of March 27, 1948. The letter of permission to reprint this article in THE NEWS asked us to make a note of the fact that the piece was quoted from the *Chemical Digest,* a publication of Foster D. Snell, Inc., New York City, "with apologies to the author whose name we have been unable to learn". Here is the article:

SPLITTING THE INFINITIVE

"One of the most closely guarded secrets of the era can now be told, how an anonymous group of grammarians, working in secrecy in a remote section of

No. 46 in a series of Staff photographs
Dr. Charles H. DuToit, Assistant Physician—Chief of the Chemistry Laboratory

the country, have finally succeeded in splitting the infinitive.

"The so-called 'Bronx-Project' got under way in 1943, with the installation of a huge infinitron specially constructed for the job by Cal Tech philologists. Though the exact details are still withheld for reasons of security, it is possible to describe the general process.

"From a stockpile of fissionable gerunds, encased in leaden clichés to prevent radioactivity, a suitable subject is withdrawn and placed in the infinitron together with a small amount of syntax. All this material must be handled with great care, as the slightest slip may lead to a painful solecism. Once inside the apparatus, the gerund is whirled about at a great speed, meanwhile being bombarded by small particles. A man with a Gender Counter stands always ready to warn the others if the Alpha-Betical rays are released in such high quantities as to render the scientists neuter.

"The effect of the bombardment is to dissociate the whirling parts of speech from one another until at length an infinitive splits off from its gerund and is ejected from the machine. It is picked up gingerly with a pair of hanging clauses and plunged in a bath of pleonasm. When it cools, it is ready for use.

"The question is often asked: Can other countries likewise split the infinitive? I think we can safely answer, 'No.' Though it is true that Russia, for one, is known to have large supplies of thesaurus hidden away behind the Plural Mountains, it is doubtful if the Russians possess the scientific technique. They have the infinitive but not the know-how.

"And that is something on which to congratulate our own brave pioneers in the field of grammatical research. Once it was thought that the infinitive could never be split—at least, not without terrible repercussions. We have shown that it is quite possible, given the necessary skill and courage, to unquestionably and without the slightest shadow of a doubt accomplish this modern miracle.

"See how easy, once you know how?"

New addresses:—

Dr. Leslie Corsa, Jr. (a. *C.M.* 1954), Stanford University Medical School, Stanford, Calif.
Dr. Chester C. d'Autremont (r.p. *N.* 1948), 82 Marlborough St., Boston, Mass.
Dr. James E. Fish (*E.S.* 1930), Lahey Clinic, 605 Commonwealth Ave., Boston, Mass.
Dr. Falls B. Hershey (*E.S.* 1947), Barnes Hospital, St. Louis, Mo.
Lt. James A. O'Shea, MC, USNR (a.r.p. *C.M.* 1950), *General M. B. Stewart* (T-AP-140), Military Sea Transportation Service, Atlantic Area, c/o Fleet Post Office, New York, N. Y.
Dr. Morton N. Swartz (*M.* 1948), McCollum Pratt Institute, Johns Hopkins Hospital, Baltimore, Md.
Dr. D. Vernon Thomas (a. an. 1952), Strong Memorial Hospital, Rochester, N. Y.
Dr. Paul Wilkin (clin. & res. fel. *S.* 1953), c/o Dr. Earl Engle, Presbyterian Hospital, 620 West 168th St., New York, N. Y.

We have received our first communication from Dr. Eugene Walker, Assistant Director at Massachusetts General Hospital from 1913 to 1920. His letter, giving as his new address The Rubicon, Fairyland, Pembroke, Bermuda, contains a full-page Christmas greeting which he sent to the staff and nurses of the Springfield Hospital, where he has been serving as Superintendent. The greeting is headed by a pen-and-ink drawing, showing Dr. Walker with one foot planted in Bermuda and the other leaving Springfield, and with hat doffed in farewell to the continent.

The greeting says, in substance, that Dr. Walker retired from Springfield Hospital on June 30. After a trip through New England and up to Canada, he arrived in Baltimore on August 14, to substitute for three months for the Director of the Hospital for the Women of Maryland. Dr. and Mrs. Walker left New York for Bermuda on November 14, in time to see Queen Elizabeth and the Duke of Edinburgh when they visited Bermuda.

His letter to us reads:

> To amplify, we not only saw the Queen and her Duke, but Churchill, Laniel, and Eisenhower, not to mention the Royal Welch Fusiliers with their mascot — a goat.
>
> Have moved into our house that we left in 1927 to go to Lakeside Hospital in Cleveland, Ohio. Moved to the Springfield Hospital in Massachusetts in March 1931.
>
> Now to enjoy life in Bermuda, I hope.

This note from Dr. Elizabeth F. Aub (*M.* 1952) was enclosed with her renewal to The News:

> Since I left the General I spent a year in Pediatrics at the Children's Medical Center in Boston. I am now in Psychiatry at the Boston Psychopathic Hospital.
>
> I have just become engaged to Dr. Robert C. Reid, Harvard Medical School Class of '51, who is also a resident at the Boston Psychopathic.
>
> I thoroughly enjoy reading The News and find it a good wav to keep up with what is happening to old friends.

This note has come from Dr. Joseph E. Warren (clin. fel. *M.* 1953):

> After leaving the General last year I began working here at the University of Pittsburgh in research and teaching, especially in relation to arthritis and rheumatism. Things are just getting under way, and I hope to be able to send you more information for The News a little later in the year.

MASSACHUSETTS GENERAL HOSPITAL 1811
No. 133 Boston, Mass. April 1954

UROLOGICAL SERVICE

The Urological Service at the Massachusetts General Hospital was started as a special department of the Hospital in 1911. The service was inaugurated through the direct efforts of Dr. Hugh Cabot, and was the first of its kind in New England. Previous to this, the genito-urinary surgery of the Hospital was performed by such able general surgeons as Dr. Arthur Tracy Cabot, Dr. Francis B. Harrington, Dr. Franklin G. Balch, Dr. E. A. Codman, Dr. Lincoln Davis, and others. The greatest single contribution to genito-urinary surgery was made by Dr. Henry Jacob Bigelow, visiting surgeon to the Hospital from 1846 to 1886. Dr. Bigelow designed the instruments for litholapaxy or the crushing of bladder stones and evacuation of their fragments. He perfected the technique of this operation and presented it to the medical profession in 1878. His instruments and technique are used today with but minor variations.

Since these early days, the Urological Service has continued as an entity at the Hospital. Dr. Cabot was succeeded as chief of the service by Dr. J. Dellinger Barney, Dr. George Gilbert Smith, and then by the present chief in 1945. The service has grown since its early days, and for many years has graduated one resident each year who is well prepared and capable of performing any urological procedure. The close association with other services at the Hospital—medical and surgical—has provided him with a broad outlook. Clinics and conferences have stimulated an interest in teaching. Sound judgment has been acquired through responsibility.

During the past year the volume of work performed by the service has remained at about the same level as in the previous ten years. In 1953 there were 483 admissions to the house service and 426 operations were performed. The record for the year was unusually good. There were but seven operative deaths—a mortality of 1.6 percent. Over a third of the operations on the service were for prostatic obstruction. There were 160 such operations during 1953, with one death—a mortality of 0.62 percent. The death followed a suprapubic cystotomy on an elderly, feeble patient. When one considers the advanced age of many of these patients and their frequent complicating conditions, this is an excellent record, with the lowest death rate for any year over a ten-year period. It is a tribute to the ability and interest in the care of patients of our present resident, Dr. Thomas J. Mathieu.

The type of operation performed for prostatic obstruction is of some interest. With us there has been an increasing tendency to treat large benign glands by open operation rather than by transurethral resection. Emphasis has always been, however, on providing our residents with adequate experience in all of the well-recognized types of prostatic surgery. The 160 prostate operations performed during 1953 by the resident staff were distributed as follows:

TYPE OF OPERATION		
Transurethral resection	88 — 55	percent
Suprapubic prostatectomy	58 — 36.25	"
Perineal "	9 — 5.62	"
Retropubic "	5 — 3.13	"

There have been no deaths due to pulmonary embolism following prostatic surgery during the past six years. There were two patients during this period whose deaths were considered due to cardiac disease, but no autopsies were performed. Formerly, about 25 percent of our deaths were due to such emboli.

Some of the other major surgical procedures performed by the resident staff in 1953 were: nephrectomies (lumbar or thoracolumbar) 15, nephro or pyelonephrotomies 11, ureterolithotomies 17, partial nephrectomies 3, renal or adrenal explorations 9.

It has been our impression that some of the services of the Hospital have suffered from the establishment of other nearby clinics and institutions supported by private or public funds. Also, that many of the local community hospitals are now so well staffed by competent surgeons and surgical specialists that they no longer need to refer their patients to hospitals such as ours. This is doubtless true. However, the record of admissions and operations on the Urological Service over the past nine years fails to show any great variation. The number of Hospital admissions, operations, and the operative mortality on the Urological Service from 1945 through 1953 are given in the following summary:

UROLOGICAL SERVICE

	House admissions	Operations	Operative mortality	Prostate operations	Prostatic mortality
1945	437	446	15 – 3.36 percent	194	7 – 3.60 percent
1946	480	468	6 – 1.28 percent	198	3 – 1.51 percent
1947	489	459	9 – 1.96 percent	162	4 – 2.46 percent
1948	450	441	17 – 3.85 percent	168	6 – 3.57 percent
1949	512	526	21 – 3.99 percent	180	9 – 5.00 percent
1950	477	477	24 – 5.03 percent	171	7 – 4.09 percent
1951	499	398	11 – 2.76 percent	198	2 – 1.01 percent
1952	452	371	13 – 3.50 percent	181	3 – 1.65 percent
1953	483	426	7 – 1.64 percent	160	1 – 0.62 percent
Totals	4279	4012	123 – 3.06*	1612	42 – 2.60*

*Average percentage mortality

The Urological Service provides a sound residency training program for those whose surgical background is adequate. A close relationship with other services—medical and surgical—gives the resident a broad outlook. The responsibility of running the service, seeing consultations, and organizing clinics builds up confidence and sound judgment. More opportunity to stimulate an interest in investigative work is desirable, to improve and round out the resident's training.

Fletcher H. Colby, M.D.,
Chief of Urological Service

RICHARD BRUCE KING

East Medical 1927

E. M. Resident 1928

Many people, professional associates, patients, and friends are saddened by the death on March 9 of Richard Bruce King. Dr. King was both a charming gentleman and a skillful and beloved physician. His passing in the prime of life is indeed tragic. For many years, with great fortitude and courage, he endured his protracted illness and disability.

Born on December 22, 1899, his preparatory school was the Friends School in Washington, D.C. He graduated from Princeton in 1921 and from the Harvard Medical School in 1925. He was highly thought of as a fourth year student in medicine at the Massachusetts General Hospital. This led to his being chosen medical intern. His excellent performance as intern was the cause of his selection as medical resident. In those days there were but two medical residents, one on each service.

Following his house staff days he entered private practice in Boston, and for many years was associated with the late Dr. George R. Minot, E.M. 1913. He retained his visiting staff position at the Massachusetts General Hospital until a few weeks before his death. For many years, too, he served on the teaching staff of the Harvard Medical School. Recently he had become a member of the Medical Associates of the Massachusetts Memorial Hospitals, a new and interesting adventure in group practice.

He leaves his wife, Marian (Stevens); a daughter, Miss Marian S. King of Cambridge; a son, Richard B., Jr., USN; and a brother, Gilbert King of Chestnut Hill.

[J. Howard Means, M.D.] J. H. M.

The Board of Trustees, at their meetings on February 3 and 19, voted:

To accept the resignation of Dr. Richard B. King from the position of Clinical Associate in Medicine.

To appoint:

Dr. Agnes S. Burt as Assistant in Pathology;

Dr. Richard B. Cohen as Assistant in Pathology;

Dr. Majic S. Potsaid as Second Assistant Resident in Radiology, beginning July 1;

Dr. Eli C. Romberg to the Board of Consultation, as of July 1, 1953;

Dr. David Spiro as Assistant in Pathology, as of July 1;

Dr. John D. Stoeckle as Assistant Physician, as of January 11.

At their meetings during February, the General Executive Committee voted:

To reappoint Dr. George W. Geiss as Clinical Fellow in Physical Medicine for one year, beginning April 1.

To appoint:

Dr. Mary L. Bertucio as Clinical and Research Fellow on the Children's Medical Service, effective July 1;

Dr. James V. Cable as Clinical Fellow in Medicine, beginning March 1;

Dr. Aristomenis Delivanis as Clinical and Research Fellow on the Children's Medical Service, effective March 1;

Dr. Max P. Dondey as Research Fellow in Neurology, for the period February 1 through October 31;

Albert W. Frenkel, Ph.D. as Research Fellow in Biochemistry, beginning February 5;

Dr. Jeanne M. Horan as Assistant Resident on the Children's Medical Service, for the months of March and April;

Dr. Margaret A. Hunt as Clinical and Research Fellow on the Children's Medical Service, effective July 1;

Dr. Domenic G. Iezzoni as Clinical and Research Fellow on the Children's Medical Service, effective July 1;

Dr. Harrison O'Connor as Clinical Fellow in Orthopedic Surgery for one year, beginning January 1;

Dr. Andrés Rosselli as Clinical and Research Fellow in Neurology for one year, beginning February 1;

Dr. Guy Vourc'h as Senior Fellow in Anesthesia, beginning July 1.

PERIPHERAL VASCULAR CLINIC

Since the last report on the Peripheral Vascular Clinic, published in a 1949 issue of The News, the keynote of the Clinic has been progress, both in the better care of the patients and in the field of vascular research.

From the clinical viewpoint, the Out-Patient Clinic is held on Tuesday morning of each week, when problem cases of peripheral vascular diseases are seen. Many are referred into the Hospital wards for surgical treatment, where they are again evaluated and presented at the regular Thursday morning Rounds in the Bigelow Amphitheatre. Most of the standard operative procedures are still performed for the various types of diseases, and new advances have been made —particularly in the treatment of diseases of the aorta and the major arteries. The use of blood vessel grafts in the treatment of aneurysms—even of the abdominal aorta, and of obliterative arteriosclerotic arterial disease of the lower extremity—has opened up a vast new field in vascular surgery. During the past year the treatment of aneurysms of the abdominal aorta and major arteries has been performed successfully in a number of cases by excision of these lesions, and the restoration of arterial continuity achieved by utilizing homologous aortic and arterial grafts. The immediate outlook for a patient with obliterative arteriosclerotic arterial disease of the lower extremities has been improved as a result of this new technique, by using similar vascular grafts to bypass areas of occlusion in the arteries and restore arterial continuity to the distal part of the limb. This new type of surgery has been made possible through the establishment of an Artery Bank by Dr. Robert S. Shaw.

The Peripheral Vascular Laboratory, which was under the direction of Dr. Fiorindo A. Simeone until he left in June 1950 to become Professor of Surgery at Western Reserve Medical School in Cleveland, Ohio, has been very active in the study and research of peripheral vascular diseases. After Dr. Simeone left, the Laboratory was under the direction of Dr. John J. Cranley until he moved to Cincinnati in 1952. Then, in January 1953 Dr. Robert S. Shaw was appointed to take charge. In addition to these men there has been a succession of younger men from other clinics who have come to work in our Clinic and Laboratory and learn our techniques, then returned to their institutions to carry on in this field. These include Dr. Davitt A. Felder, who came from Minneapolis in 1948 and returned there in 1950; Dr. John J. Cranley, who came from the Boston City Hospital in 1949 and remained here until 1952, when he moved to Cincinnati; Dr. James L. Buchanan, who came from Pittsburgh in 1950 and returned there in 1952; and Dr. Charles V. Menendez, who came from New Orleans in 1951 and is still with us. In addition, the Laboratory has been most fortunate in having the services of Mrs. Ida R. Gordon, who has been our technician since June 1950. Her assistance has contributed greatly to the success of the Laboratory.

Following are some of the important contributions from our Laboratory:

The perfection of the Grass digital plethysmograph for the study of arterial circulation was carried out in the Laboratory by Drs. Simeone and Cranley. This is an extremely sensitive instrument for measuring changes in blood flow, that is of special value in determining the efficacy of various methods of improving the arterial blood flow to the distal part of the limb.

Dr. James L. Buchanan studied the direct effect of cold on the arterioles and capillaries, utilizing the Grass plethysmograph, and found that the response varied greatly in different individuals but was most marked in patients with Raynaud's disease. This response was observed even following adequate sympathectomy and, it is believed, explains the failure to completely relieve some of the patients with this disease. This instrument was also used in the operating room in cooperation with Dr. Donald P. Todd, to measure the effect of various anesthetic agents on the circulation of the digits of the extremity, both before and after sympathectomy.

During the past four and one-half years, it has been possible to carry on the Laboratory and many of these studies through the aid of a yearly grant from the U.S. Public Health Service. Under this grant a carefully integrated study of immediate and late effects of an adequate lumbar sympathetic ganglionectomy is being carried out on a group of patients with obliterative arteriosclerotic arterial disease of the lower extremities.

Since Dr. Robert S. Shaw has taken over the Laboratory, he has developed a bank for the storage of blood vessels which are used to replace segments of "worn-out" arteries, due either to aneurysms or occlusive arterial diseases. These blood vessels, for the most part, are obtained at autopsies. Like the Eye Bank, we now need to request permission from relatives or patients to remove the various blood vessels—especially the aorta, and the iliac and the femoral arteries, since these are the ones which are most frequently required for replacement. The blood vessels are sterilized at the Massachusetts Institute of Technology by irradiation with the 2-million-volt cathode ray machine, and then stored in carbon dioxide ice.

The facilities in our Laboratory have been greatly improved during the past year since we moved into the new Research Building, where we now have two well-constructed temperature-control rooms where we may carry out many of the studies which are necessary in this field. As a result of all this cooperative enterprise, it has been possible to keep abreast of the newer advances in the field of vascular surgery and, we believe without question, more and better work will be forthcoming from the Clinic and the Laboratory.

Robert R. Linton, M.D.,
Head of Peripheral Vascular Clinic

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable time and trouble when you fail to include it.

Your title should be classified with respect to the subject matter and not under the Hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

General Medicine

Graham, J. R., and Scatterfield, A. P.
Headache problems: Some helpful suggestions.
Boston, Headache Research Foundation.

Laboratory Science

Matoltsy, A. G.
A simple microcinematographic apparatus for biological studies.
Lab. Invest. 3:66-70.

Matoltsy, A. G.
Studies on the action of p-phenylenediamine on living cells.
J. Invest. Dermat. 21:447-455. (1953)

Otolaryngology

Kelemen, G.
Symmetrical enlargement of submaxillary salivary glands in the aged.
Geriatrics 9:70-74.

Pathology

Tejada-Valenzuela, C., Toriello, J., and Thomas, W. A.
Structural changes in intrapulmonary arteries exposed to systemic pressures from birth.
A.M.A. Arch. Path. 57:51-61.

* * *

Now that spring weather is drawing near, it has occurred to us that the time has come to present the subject of an inter-hospital tennis tournament, so that those of our Visiting and House Staff who are good tennis players (and we can verify that there are several) may begin their practice of the game with a definite object in view—that of retrieving the trophy lost to the Brigham almost ten years ago.

The best way to give you the story of the trophy is to quote an article by Dr. Faxon which appeared in the November 1944 issue of THE NEWS. It reads:

> About a month ago Miss Holbrook, archivist, showed me a silver pitcher which was inscribed the "Sir Cuthbert Wallace Inter-Hospital Tennis Trophy No. 2, presented by Dr. Harvey Cushing". On it were inscriptions which showed that the Peter Bent Brigham Hospital had won this trophy twice and that the Massachusetts General Hospital had won it three times, the last being in 1929.
>
> In the spring of 1922 Sir Cuthbert Wallace of London gave a cup in order to give impetus to friendly inter-hospital tennis rivalry. To own the cup, a given hospital team should win it on three occasions. The hospitals originally included in the contest for the cup were the Peter Bent Brigham, the Massachusetts General, the Homeopathic, the Children's, the Psychopathic, and the Boston City Hospital. The tournament created much amusement. The Brigham Hospital won the cup in 1922, 1923, and 1924, thus holding it forever. Dr. Cushing, in 1925, offered the "Sir Cuthbert Wallace Inter-Hospital Tennis Trophy No. 2", to be played for until it could bear no more inscriptions.
>
> Inquiry as to why this trophy has not been played for since 1929 has brought forth a multitude of conflicting statements, from which emerges only the certainty that there is no official record that it has been played for since then.
>
> It seemed unfortunate that the friendly rivalry in sports between the hospitals, encouraged by reason of this trophy, should not be continued; and, consequently, the Brigham was asked if they desired to challenge for the trophy—a request which met with their hearty approval. Matches were arranged to be played on Sunday, September 24, 1944, on the Brigham grounds. The result was that the Brigham won three out of four singles matches and both of the doubles.
>
> It is hoped that these annual tennis matches may be continued.

It wasn't until September of that year that the trophy was uncovered. Our players had little or no time to prepare for the matches, and it was no surprise to anyone that we went down to almost complete defeat. But the situation is different now. With this proposal made so early in the season and with our fine new tennis court so conveniently at hand for practice, we should be able by tournament time to stand a good chance of bringing the trophy back to M.G.H. How 'bout it, you tennis players? Let's challenge and beat Brigham!

MASSACHUSETTS EYE & EAR INFIRMARY

The Infirmary welcomes several new visitors to its clinics and laboratories. Among the recent arrivals are the following:

A. Dale McMullan came here from Seal Harbor, Maine, on February 23. Mr. McMullan is at present working with Dr. Weille as a technical assistant. He plans to spend at least eight months at the Infirmary.

Dr. Claude Dube came here from Campbellton, New Brunswick, and has just completed the Postgraduate Course in Ophthalmology. He is now observing the Ophthalmic Service for three months.

Dr. Eric M. Swanson, a Heed Fellow, is visiting the Infirmary for two months. During this time he is observing in the clinics and operating rooms.

Dr. Rameshwar Lal Pahwa is here from Delhi, India, for two weeks of concentrated training in corneal graft surgery and related techniques, under Dr. Garrett L. Sullivan. Dr. Pahwa has just completed his Postgraduate Course in Ophthalmology.

Meetings held at the Infirmary during the past month included that of the New England Ophthalmological Society on March 17 and the Alumni Meeting from March 20 to 22.

The New England Oto-Laryngological Society will meet here on April 21.

The American College of Surgeons met in Montreal, Canada, March 31 through April 2. Dr. Edwin B. Dunphy and Dr. LeRoy A. Schall were speakers. Dr. Samuel T. Adams, a graduate of the Infirmary in 1951, was also one of the speakers. Dr. Adams is now living in Montreal.

Dr. George Kelemen attended the Pan-American Congress of Otolaryngology in Mexico City, where he remained until March 14. Dr. Kelemen presented a lecture at the meeting.

Dr. Daniel E. M. Martinez, whose home is in Mexico City, also attended this meeting and then visited with his family.

Brief bits:—

Dr. Joseph S. Barr gave two lectures in February before the Mid-South Postgraduate Assembly, in Memphis, Tennessee.

Dr. Walter S. Burrage was guest speaker at a meeting of the Philadelphia Allergy Society on February 24. His subject was "The small pulmonary vessels of living mammals".

Dr. Bradford Cannon spoke on "Facial injuries", at the Sectional Meeting of the American College of Surgeons, held in Montreal on March 31.

In January, Dr. Edward D. Churchill participated in the course on Medical Care of Atomic Casualties, given at the Army Medical Service Graduate School in Washington, D.C. On February 8, at the invitation of the Yale Medical Society, through Dr. William W. L. Glenn (a.r.s. 1946), Dr. Churchill spoke on "Problems in wound healing". The address was preceded by a dinner given by the Society in Dr. Churchill's honor.

Dr. Fletcher H. Colby was elected Vice-President of the Clinical Society of Genito-Urinary Surgeons, at a meeting of the Society held in Los Angeles on February 23.

Dr. and Mrs. Nathaniel W. Faxon have returned from a six-weeks' motor trip through the South. After spending Christmas with their son who is with the U.S. Navy Air Force at Key West, they journeyed to New Orleans and then back to Palm Beach, where Dr. Faxon represented the Massachusetts General Hospital at the Society of Medical Administrators' conference. On their way home they visited with Dr. and Mrs. Joseph S. Lichty in Greensboro, North Carolina, and Dr. and Mrs. W. T. Sherman Thorndike in Germantown, Pennsylvania, all of whom sent greetings to their many friends in Boston.

Drs. Margaret M. and R. Earle Glendy (*C.M.* 1932 and a.r.p. 1934, respectively) paid a return visit to M.G.H. in early March. We learned from Dr. Earle that he has recently resumed an affiliation with the University of Virginia School of Medicine, where he finished in 1931, as Lecturer in Medicine. Dr. Margaret is Clinician for the rheumatic fever clinics in southwestern Virginia, where the rheumatic fever program has been greatly expanded in recent years. They extend a cordial welcome to MGH-ers traveling in the vicinity of Roanoke, where they live, and want you to know that they always keep their latchstring outside for you.

Dr. Herbert H. Howard (*W.S.* 1914) has sent us a card, saying that he is no longer in active practice and giving as his new permanent abode Winter Mooring, 1 Fishers Lane, Delray Beach, Florida.

Dr. Howard B. Sprague was one of the visiting lecturers at the University of Mississippi Postgraduate Course in Cardiology last February. This was the first such course ever sponsored by the University, and was given in cooperation with the Mississippi Heart Association, the Mississippi State Board of Health, and the Department of Conferences and Institutes, University Extension, University of Mississippi. The course was held in the beautiful new Alumni House of the University, and the organization of the course was outstanding under the leadership of Dr. Arthur C. Guyton (*W.S.* 1943), now Chairman of the Department of Physiology and Biophysics of the University.

New addresses:—

Dr. William B. Adams (*E.M.* 1918), Owls Head, Maine

Dr. Edwin F. Alston (*Path.* 1944), 2107 Van Ness Ave., San Francisco 9, Calif.

Dr. Frances J. Bonner (a. *Psychiat.*), 127-A Bay State Rd., Boston, Mass.

Dr. Javier Correa (clin. & res. fel. *M.* 1953), Arenales #615, Lima, Peru

Dr. Frank R. L. Egloff (r.p. *Psychiat.* 1951), 1007 Farmington Ave., West Hartford, Conn.

Dr. Rosemary V. Gorman (a.r.p. 1945), 626 Westminster Ave., Elizabeth, N. J.

Dr. Maurice H. Greenhill (r.p. *Psychiat.* 1939), Psychiatric Institute, University Hospital, Baltimore, Md.

Dr. Laurence K. Groves (*W.S.* 1947), 2020 East 93rd St., Cleveland 6, Ohio

Dr. Oscar W. Hills (*M.* 1943), 111 St. Matthews Ave., San Mateo, Calif.

Dr. William L. Kermond (a.r.s. *Or.* 1954), 51 Urquhart St., Castlemaine, Victoria, Australia

Dr. Elizabeth A. Koppel (a.r.p. *An.* 1954), 437 Cedar St., N.W., Washington 12, D.C.

Dr. James Lewis (*W.M.* 1935 & *C.M.* 1936), 281 State St., Springfield, Mass.

Dr. Robert C. Lincoln (*Dn.* 1953), Harvard Medical School, Boston, Mass.

Dr. Sydney B. Maughs (a.r.p. *Psychiat.* 1938), Psychiatric Unit, Forty-five Hundred West Pine Clinics, 4500 West Pine Blvd., St. Louis 8, Mo.

Dr. Alex F. Müller (a.r.p. 1953), Department of Medicine, Hôpital Cantonal, University of Geneva, Geneva, Switzerland

Dr. Elliot V. Newman (*C.M.* 1941), Vanderbilt University School of Medicine, Nashville 5, Tenn.

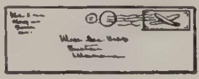
Dr. Edgar B. Phillips, II (*C.M.* 1948), 319 Longwood Ave., Boston, Mass.

Lt. Walter T. St. Goar, MC, USAFR (*M.* 1950), 4452nd Base Hospital, George A.F.B., Calif.

Dr. Ralph H. Seelye (*E.S.* 1891), 131 Crescent Rd., Longmeadow, Mass.

Dr. Byron W. Steele, Jr. (a.r.s. 1952), 1307 South Main St., Tulsa, Okla.

Dr. Jack L. Ulmer (r.s. *N.S.* 1942), McGuire Veterans Administration Hospital, Richmond 19, Va.



When Dr. George O. Clark (*E.S.* 1904) replied to our tracking-down letter and assured us that the revised address we had discovered for him is correct—"Chailey", Newburyport, Massachusetts —he gave us this additional bit of information:

> Three years ago we removed from 343 Beacon Street, Boston, and expect to use all the year round what for the past thirty years we used only during the summer months.

One of our sleuthing efforts resulted in this letter from Dr. Harry A. Bliss (*M.* 1945), whose present address is 4 West Clearfield Road, Havertown, Pennsylvania.

> Thanks for your interest. I am grateful for your skill in detection.
>
> I am doing a second stint in the Navy (by request), but am actually having quite an enjoyable stay as cardiologist at the Navy Hospital in Philadelphia. Regrettably, we have no other MGH-ers here, though there are a good many at nearby teaching institutions. I have particularly enjoyed seeing Nipper Schnabel who is finishing a Markle Fellowship at the Hospital of the University of Pennsylvania and who provided the ultimate in hospitality by taking me into his home for my first three weeks here.
>
> In case you don't have his address and to further your tracking, Wally Bedell is also in the Navy, doing research on freeze-dried arterial grafts at the Naval Medical Research Institute, Bethesda, Maryland (home address — Rockville Pike, Rockville, Maryland).

We were delighted to receive this first letter from Dr. Joseph S. Lichty, Assistant Director at M.G.H. from 1946 to 1950. Dr. Lichty left here to become the Director of the Moses H. Cone Memorial Hospital in Greensboro, North Carolina. He writes:

> This Hospital celebrated, in a quiet way, its first birthday the 25th of February. Having opened 53 beds a year ago that day and admitted 27 patients, the end of the year finds us with 174 beds open and an average census of 155. The Medical Staff includes two MGH-ers — Dr. John F. Register, an Attending Surgeon, and Dr. Eulyss R. Troxler, an Associate Surgeon — both of whom practise Orthopedics.
>
> It was with the greatest of pleasure that Mrs. Lichty and I received a visit from Dr. and Mrs. Faxon, who passed through here in February on their return from a winter in Florida. One of their delights was renewing acquaintance with our Boston terrier, Bunker Hill, who lived with them, first briefly in the Resident Physician's House and then longer at West Falmouth, and whom they gave to us in 1949.
>
> I frequently see the MGH transplants at Chapel Hill, and would be glad to have a visit here from anyone.

* * *

A few years ago Dr. Ralph H. Seelye (*E.S.* 1891) read a paper before a meeting of the Springfield Medical Club. This interesting, exciting, and intimate portrayal of conditions at Massachusetts General Hospital during Dr. Seelye's internship and the several incidents he relates concerning outstanding members of our Staff in those days give us this graphic picture of surgery as it was practised at M.G.H. sixty-three years ago.

At the risk of being classified with certain senile old gentlemen who are concerned almost entirely with the past, it has seemed that it would be amusing to me and, perhaps, of interest to my friends if I were to hark back and try to portray the conditions and picture some of the men of the Massachusetts General Hospital at the time I interned there.

The Hospital consisted at that time of the old Bulfinch Building, the operating pavilion, the Out-Patient Department, and four pavilion wards—three of private rooms, one of which was for private patients, though as far as a fee was concerned they were treated as house patients.

The successful candidates who had worked and intrigued in every possible way to rate in scholarship and personality in order to attain the most coveted hospital position in Boston were, on entering upon their duties, immediately put in their proper status. Not being considered by the staff fitting that there should be any sort of parity with them, it had long been decreed that their doctorate should not be conferred until a year after graduation. They were, therefore, always addressed as "Mister". The term "Intern" was not used. "House Officer" and occasionally the historic name of "House Pupil" were in use, or, sometimes in a slightly derogatory manner, "House Pup" was applied by the older men. There seemed to be a desire not to imperil to a perceptible degree any tendency to an inferiority complex. This may have been a wise policy. There was no familiarity on the part of the house staff with the visiting staff. Their relations were conducted with dignity and decorum. The Staff Room was a sanctum into which a house pup never penetrated except by special invitation. I never saw the inside of it. Ward visits were conducted with the utmost solemnity. The Chief, with the senior house officer followed by the junior and the extern, marched with military precision from bed to bed, the head nurse bringing up the rear. Diagnosis, prognosis, and treatment were decided upon, and with all dignity the procession moved on to the next ward.

This period was nearly at the end of the old regime of non-aseptic surgery. Antiseptics were used in moderation—chiefly bichloride of mercury and carbolic acid.

Operations were done every day during the week except Sunday, but Saturday morning was "Operating Day", with the amphitheatre filled with students and doctors.

The two surgical services, East and West, were each manned by three visiting surgeons who had four-month services. The surgical house staff—two seniors, two juniors, and two externs—was also divided into East and West services, so each of the operating crews consisted of the Chief, the senior house officer as first assistant, the junior as second assistant, and the extern as etherizer. At other times the extern served in the Out-Patient Department.

Operations started at eleven o'clock. The senior house officers had charge of the operating room on alternate Saturdays, seeing to it that everything went in an orderly manner, that the patients were brought down promptly, that the ether was started on time, that the proper instruments were selected, and so on. The instruments were put into an agateware basin by the head orderly and deprived of a certain modicum of microbes by a few minutes' lavage under the hot water faucet in the sink. There were seven two-gallon jars in an anteroom, displaying in proper order the names of the days of the week. These contained sea sponges in a solution of 1-20 carbolic acid. Sponges for the day were used from the proper jar and afterward washed and returned to the same jar, so that all sponges soaked for at least a week in 1-20 carbolic.

Red plush pincushions hung at each side of the arena, conveniently holding needles threaded with silk arranged in semi-artistic designs by the nurses. It had not seemed to anyone advisable to sterilize these sutures. Silk of the same kind was used for ligatures. Catgut was just being introduced at that time, but it was far from aseptic. Dressings were fashioned from nice clean gauze and absorbent cotton.

"Start the ether." The extern takes a sponge similar to that into which, in the same Hospital, ether was first poured for the purpose of anesthesia. The orderly holds down the scared, struggling victim; the senior house officer sticks his head in the doorway and says, "Push the ether"; the patient, deeply cyanotic, is expedited in the arms of the orderly, practically in opisthotonos, and placed upon the table, spastic in every muscle.

The surgeon wore what was the vogue at that time—a Prince Albert coat that had, perchance, served its modish purpose at his nuptial ceremony and which, after a well-rounded period of social activities, finally became relegated to the surgical dressing room. These coats were held in rather high esteem by the staff, apparently measured by the extent of lamination accumulated in the purulo-hemorrhagic by-product of their operative manipulations. A coat that would stand alone was regarded as the acme of operative regalia. (In order to dissipate this unsightly picture as quickly as possible, it is to be stated that in the early days of my service these most flagrant relics of septic days were discarded.) The surgeon, after carefully washing his hands, dipped them rather gingerly into a 1-1000 solution of bichloride. The patient, meanwhile, had quieted down and the operation was on.

Strange as it may seem, sepsis was not a common operative sequel. What was lacking in asepsis was partially compensated for in technique, dexterity, careful handling, and rapidity—clean-cut wounds and unbruised tissues being less liable to become infected.

Orthopedic, gynecological, and genito-urinary cases were all on the general service. Surgery was practically limited to the surface of the body, various tumors (notably cancer of the breast), hemorrhoids, fistulae, perinea, cervices, tuberculosis of bones and joints, and glands of neck. These tubercular conditions, which are rarely seen now, were then very common. Traumatic surgery occupied an important position in the daily routine. Amputations were common occurrences, wounds were frequent, and fractures were prevalent. The latter were managed, under the rather casual supervision of the visiting staff, by the house officers and, by virtue of tradition passed down from one service to another as to methods of splinting and bandaging, were taken care of with more than ordinary success. When one considers that these cases were treated by inexperienced house officers without the benefit of X-ray, the results obtained must be regarded as truly remarkable. The cranial cavity was not invaded except for depressed fractures; the pleura only for empyema. Herniae, unless strangulated, did not tempt the surgeon. I never saw an appendix in a living subject until I had been in practice about nine months. Appendiceal abscesses were rarely seen. They were all carefully watched by Dr. Reginald H. Fitz, who four years before had described and named the disease with which every layman is now familiar, who saw each case in consultation, watched it until it was "ripe", and finally advised operation.

During my year in the house there were twenty-eight laparotomies on the East Surgical Service, which represented about half the number done in the Hospital during that time.

I have always felt it was a matter of much interest and great educational value that the change from the old regime to the new aseptic era came during my internship. A new pavilion was built, with private rooms for about sixteen patients and an operating room which was for all practical purposes comparable with what is used today. Adequate sterilizers were supplied and all the necessary paraphernalia. This was for abdominal cases only. Aseptic technique was instituted and fairly successfully carried out. Sterile gowns, sheets, gauze sponges, instruments, sutures, ligatures, etc. were provided. The patient's skin was prepared with green soap poultice and bichloride, and the surgeon's hands with permanganate of potash and oxalic acid. It was hard for the older surgeon to refrain from adjusting his glasses or scratching his nose during an operation, and the house officer was always on the alert to repair the breaks in asepsis.

The old amphitheatre continued on in its old-time squalor, it having apparently occurred to no one that asepsis was desirable except in abdominal cases.

I stated earlier that results were, on the whole, very fair. They were, however, occasionally marred by the appearance of sepsis. On one occasion, as the result of a Saturday "Operating Day", four patients died of sepsis—a case of cancer of the breast, a fatty tumor of the back, a reamputation of the arm, and a stone in the bladder. (Renal calculus, we may say parenthetically, was quite common and Dr. Henry J. Bigelow's operation of litholapaxy was not an uncommon procedure.) This particular high Saturday morning mortality caused considerable perturbation. One ward was cleared out, scrubbed and painted—a bacteriological neophyte having reported the discovery of the streptococcus upon its walls.

We house officers learned much from each other, passing down from senior to junior valuable information that was traditional to the Hospital. From a very understanding head nurse my first contact with patients was saved from much embarrassment by her helpful suggestions at the beginning of my ward service, but our real education was absorbed from the visiting staff. These I shall always think of (as I have since my first contact with them in Medical School days) as supermen, and the privilege of knowing them, and working for and with them, cannot be measured by any standards that we know anything about. Warren, Homans, and Cabot prided themselves on notable surgical progenitors. They belonged to what has been referred to—a little unkindly, perhaps—as "the Boston legendary type with all its handicaps". Porter and Beach would share with Richardson the characterization of not having had "the alleged disadvantages of the background of a legendary Bostonian". Whether "legendary Bostonian" or natives of more rural communities, these men were pre-eminent and will go down into medical history as such. Charles A. Porter, John Homans, and Arthur T. Cabot were West Surgical; J. Collins Warren, H. H. A. Beach, and Maurice H. Richardson were my Chiefs on the East side. Although I did not come into as intimate contact with the West side men, I saw much of them and watched their work with much admiration.

Dr. Porter was a charming gentleman. His technique, outstanding in general operative procedures, excelled particularly in plastic surgery—in the closure of large wounds, for instance—and notably in his beautiful work in the restoration of hare lip. I remember a case of complete extrophy of the bladder in which, by his fine plastic work, a new anterior bladder wall produced a functioning bladder. Those who knew "Ally" Porter saw in him very many fine traits that were inherited from his father, Dr. Charles B. Porter.

Dr. Homans, somewhat in contrast to Dr. Porter, though having the artistocratic Back Bay air that all these gentlemen had, was bluff and even at times brusk. He was outstanding as the pioneer in abdominal surgery in New England. From 1872 to 1875 he operated upon five women with large ovarian cysts. They all died. Nothing daunted, he continued the work and by 1887 had performed 272 additional "ovariotomies", as he called them, with a mortality of 14%. At this time it became my privilege to assist him, during my second and third years in the Medical School, at a small private hospital on Beacon Hill where he averaged about two cases a week. "Uncle John", as we called him, employed about the same technique as that used at the M.G.H. at that time. He still used the carbolic spray, though he soon afterward abandoned it. Also, as a surgical refinement, an old-fashioned clothes wringer was brought into play for the purpose of rendering the sponges more absorbable. "Young John", Uncle John's nephew, was first assistant, and one of the two student assistants worked the wringer. Now and then, if the full quota was lacking, Uncle John's coachman was haled into the more comfortable quarters of the operating room and, without any particular attention to his toilet, was put in charge of the wringer. The atmosphere, already surcharged with carbolic spray, absorbed the aura of equine excrement with readiness, thus generating an aroma not likely to be confounded with frankincense and myrrh. To counterbalance the lack of asepsis, Dr. Homans had acquired a surgical technique that was remarkable in the ease and rapidity with which he removed large tumors, complicated as they were many times by masses of adhesions. Being with him for two years was an experience the value of which it is not easy to estimate.

Dr. Cabot was a good surgeon and was particularly adept in genito-urinary work. I shall never think of Dr. Cabot without the mental picture of a nephrectomy. After tying the renal artery, he remarked as he was severing the stump, "Gentlemen, this is the critical point of the operation." There was a geyser of blood, but, aside from a greyish tinge to his countenance, Dr. Cabot showed not the slightest evidence of nervousness or emotion.

Dr. Warren was a scholar better acquainted with medical literature and, from extensive study abroad, better versed in international surgical lore than many of his colleagues. He never unbent from his impressive dignity in his relations with the staff or the house pups. He was not entirely successful at times in concealing an innate irascibility that cropped out when things went wrong in the operating room; but house officers, often awed by the relationship, nevertheless unfailingly regarded him with admiration and respect. Dr. Warren was pre-eminent as an old-time surgeon, but did not find it easy to take up the new regime beginning at that time. At amputations, resections, and the like he was an ace. Osteoplastic resection of the upper jaw was his special joy. In this he relaxed his hauteur as, blowing micro-organisms through his moustache into the wound, he would exclaim in tense tones, "Stand by me, boys! Stand by me! He's bleeding to death!" He was particularly keen in diagnosis. For instance, a man with a very large abdominal tumor had been baffling the diagnostic acumen of the staff for several days. As he was being shown in the amphitheatre, Dr. Warren walked by and immediately said, "Pancreatic cyst." Upon being asked later how he arrived at such a quick solution of the problem, he said, "I once saw a pancreatic cyst in Paris with exactly the same contour."

Dr. Beach, also, was a gentleman impressive in his dignity—a dignity, however, tempered by a charm of manner and gracious condescension that made for pleasant association. Meticulously careful in diagnosis, he sometimes irked the house officers who were eager for operations—for example, the ovarian cyst which for about two weeks was carefully measured to rule out the possible element of malignancy that might be indicated in a rapid growth. Dr. Beach was extremely conservative in his selection of operative cases. Those which he did select were done with skill and precision, with careful attention to every detail

Dr. Arthur W. Allen, past Chief of our East Surgical Service and now a member of our Board of Consultation, being sworn in as a Trustee of Massachusetts General Hospital by Governor Christian A. Herter, with Charles J. Gabriel, the Governor's Councillor, acting as witness.

of his work. His ward visits were an education in themselves. I have a picture in my mind of one of these always impressive ceremonies during which Dr. Beach, who was very fond of music, halted the procedure to listen in rapt attention as a procession marched by outside to the solemn strains of Chopin's "Funeral March".

Dr. Richardson was of a somewhat different type from his colleagues. A man of impressive physique, he would arouse admiration at first sight. His pre-eminence as an anatomist was responsible to a degree for his remarkable technique. He was the first student in the Medical School to attain a mark of 100% in anatomy. He not only knew surgery but he made surgical knowledge, and excelled in imparting this knowledge. To demonstrate the surgical anatomy in relation to operations he was about to do, standing before the blackboard with chalk in each hand he would ambidextrously, with amazing rapidity and skill, start with the spinal column, fill in the portion of skeleton desired, lay on the muscles, trace the nerves, arteries, and veins, and so produce in a few moments a not-easily-forgotten picture. Dr. Richardson was a big man, with very large hands. The wonder was that he was so perfect in fine technique. Perhaps his skill in playing the cello was of some benefit. He deserved the title which has been applied in later years to certain aces in sports—a "natural". He had perfect coordination and made no false motions. It was in vain that we looked to see him miss when, at the end of his drawing, he would playfully toss the chalk into the box eight or ten feet away. Knife, scissors, or needles were used equally well with either hand, and his single-handed tying of ligatures and sutures incited many a student to practise that useful accomplishment during lecture hours. Dr. Richardson was more instinctive than analytical in his solution of surgical problems, more radical than conservative in his treatment of them. Brilliant, progressive, courageous—he led groping surgical aspirants into regions of dreaded surgical procedures. His famous removal of a denture from the cardiac orifice of the stomach illustrates his daring confidence and operative skill. His natural good-fellowship and bonhomie tended to a certain extent to break down the barrier between the visiting and house staffs, developing, in the more cordial relationship, our loyalty and adoration. While we house officers had a tremendous admiration and profound respect for the other Chiefs, we had a deep-seated affection and genuine fondness for Maurice Richardson.

It is interesting in looking back to note that these men, whom we regarded not exactly as old gentlemen but as men well advanced in years, ranged in age from 38 to 54, averaging 46 years. Their average span of life was 68 years.

From these men we learned not so much how to do certain operations. We learned surgical principles and how to operate. We learned by their example that surgery was a science and an art that must never be stultified by sordid considerations. We left them with a never-failing appreciation of their part in our development, and we went forth from the Massachusetts General Hospital grateful to it in our hearts for having been privileged to serve as "house pups".

The many friends of Jeannette MacDonald, our switchboard operator who has been ill for the past few weeks, will be glad to receive this report sent us by a friend of Jennie's who saw her in the O.P.D. one day early in March. The friend says:

Jennie was as peppy as ever and anxious to know how all her many friends in the M.G.H. are. But what is more important to Jennie's friends is how *she* is doing.

Well, she is now spreading her good cheer at Storrow House and she loves it out there. She is constantly improving — can even do the rhumba when in the mood — and it is good to see her "sparkle" back again. But more important than that — to Jennie — is the fact that she wants more than anything else to express her very deep gratitude to all the MGH-ers for their cards, good wishes, flowers, prayers, and all the many kindlinesses expressed during her illness. The display of affection in her direction still awes her, she says, and is something she will never forget.

What she doesn't know is that all at the M.G.H. who have had the privilege of knowing Jennie as a person or as a kind voice on the phone, are still rooting for her and remembering her in their prayers. It's wonderful seeing her up and around, with her friendly hand shake and her "How are you?"

Jennie's parting remark as she left the O.P.D. for Storrow House was: "Remember, say thanks to each and every one through The News, so they will all know how I feel. They were wonderful to me. May God love them."

No. 134 Boston, Mass. May 1954

ENDOSCOPY

The last MGH NEWS report on this subject was three years ago, at which time graduate students from various parts of the world were being accepted for training in endoscopy. This type of graduate teaching has now been discontinued in order to permit training of our own Surgical House Staff in endoscopy. The change came about as a result of the report of the Surgical Residency Survey Committee (1951), in which "those answering the questionnaire (with regard to special fields of surgery) wished, in order of preference, greater experience in surgery of children's diseases, in endoscopy, in traumatic surgery . . . and in thoracic surgery." It was recommended that "more experience in thoracic surgery and endoscopy be arranged by better organization of our own clinical resources. . . ."

In the analysis of the general questionnaire "several men suggested that the House Staff should have a regular rotation through endoscopy. . . ." Starting in October 1952, the following members of the Surgical House Staff have rotated through endoscopy for periods varying from two to eight months: Peete, Manley, Nielsen, Shannon, Currie, Richardson, Austin, S. Gundersen, Garran, Coe, West, and Russell. Two months is much too short a time for endoscopic training. Although the manual dexterity part of it usually comes easily to those training in general surgery, the interpretation of endoscopic findings is not so easy. Fortunately, some of those who have had only two months will be assigned later for a further period. The Endoscopy Service also trains one man from the ENT Service and one from the Department of Anesthesiology.

Considering that the private and semiprivate cases are done by the Visiting Staff, there is none too much material for the teaching of four men at a time from the various House Staffs. However, it is felt that they get out of it about what they put into it, as is true throughout life, and if they are there faithfully for every endoscopy clinic they can learn much by observation.

It should be emphasized that the patient must be regarded as a whole, and not as just a subject for the passage of a diagnostic instrument. In other words, the endoscopist should know his patient beforehand and should follow his course after the endoscopic procedure.

Although there are no formal lectures in endoscopy for undergraduate students, special lectures in endoscopy are given to undergraduate groups taking courses in cancer, gastroenterology, and pulmonary disease. A lecture is also given every year to a large group of graduate students in medicine, and sometimes to a special group in surgery.

Edward B. Benedict, M.D.,
Endoscopist

At the annual meeting on April 3, Dr. Howard B. Sprague was given the Gold Heart Award by the American Heart Association, with the following citation:

American Heart Association
Gold Heart Award
Howard B. Sprague, M.D.

who has profoundly influenced the growth and development of the American Heart Association through his distinguished services in its highest councils and during his presidency in 1950-51. His humanity, vision and practical wisdom have been of great significance in the shaping of organizational policy, and in winning support of medical science and the public for the objectives of the Association.

This Award is given annually to one physician and one layman in the United States.

* * *

On March 19th last, Dr. Rosalind Pitt-Rivers received word here from London that she had been elected a Fellow of the Royal Society. This is the highest honor that can come to a scientist in Great Britain.

Dr. Pitt-Rivers was born in London in 1907. Her academic degrees, all from the University of London, were B.Sc. 1930, M.Sc. 1931, and Ph.D. (in biochemistry) 1939.

In 1937 she began working in Harington's laboratory at University College Hospital Medical School, London, on the biochemistry of thyroxine. Sir Charles Harington has long been known to the workers of our thyroid group for his outstanding work on thyroxine, which he was the first to synthesize chemically. In May of 1951 both Sir Charles and Lady Harington endeared themselves to the whole MGH family when he came to us to make the chief address at the opening of the new Research Building. In 1942 Harington was made Director of the National Institute for Medical Research, located first at Hampstead and later at Mill Hill outside London. When he went to assume this new duty he took Pitt-Rivers with him.

In the war years Pitt-Rivers worked with Harington in the field of immunochemistry, in relation to sensitization of workers to various chemicals used in manufacturing explosives. She also continued working, however, on thyroid problems which have engaged her attention to date. At first she was concerned with the biosynthesis of thyroxine, and later, with the arrival of Dr. Jack Gross at Mill Hill in 1950, she began, with him, studies of unknown compounds in the thyroid. In the course of this work the new compound triiodothyronine was identified, isolated, and assayed in rats, and later, with W. R. Trotter, in myxedematous patients. It proved to have thyroxine-like activity, and a greater speed of action than the tetraiodo acid. To workers in the field of thyroid physiology this discovery was quite startling.

Collaboration between Harington's laboratory and our thyroid laboratory began as early as 1928, when the late W. T. Salter, W.M. 1928, spent a year at the University College Hospital. Many substances derived from the thyroid by Harington have been assayed on patients with myxedema in our Thyroid Clinic, and recently Dr. Lerman of the M.G.H. has assayed triiodothyronine on patients in the Mallinckrodt Ward IV.

In view of all these things it was natural that we should want Dr. Pitt-Rivers to come to work at the M.G.H. and, happily, this has been accomplished. She arrived September 15th last, and expects to complete here the full year. She has had laboratory space in the Research Building and has worked in collaboration with Dr. John B. Stanbury and other investigators of the thyroid group. Her studies have had to do with the products of the thyroid gland to be found in the peripheral blood of humans.

Dr. Pitt-Rivers has been in great demand and has visited and lectured at nearly all the important centers of thyroid research in this country. The M.G.H. can take great satisfaction in having made it possible for her to come here. She has provided a powerful stimulus to our thinking on the thyroid, and broadened our approach to the mystery of its function.

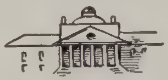
We congratulate this distinguished investigator on the high honor that has come to her. It makes us happy that this should have happened during her visit to our Hospital.

[J.H. Means, M.D.] J. H. M.

* * *

The 31st Annual New England Hospital Assembly brought some 5,000 hospital trustees, administrators, auxiliary members, and personnel together on March 29, 30, and 31 at the Hotel Statler in Boston. During the 26 sessions, 119 speakers and discussants covered all phases of hospital operation, and there were 100 outstanding exhibits of hospital equipment and supplies. The theme of the entire program was the constant improvement of hospital service in relation to better community health.

The Massachusetts General Hospital was well represented in the program. Among those participating were Dr. Dean A. Clark, General Director of the Hospital and a member of the Board of Trustees of the Assembly, who presided at the Trustee Institute for Larger Hospitals. The topic at this session was "A governing board's responsibility for medical care", and one of the speakers was Dr. James Howard Means, past Chief of our Medical Services. Dr. W. Franklin Wood, Director of McLean Hospital, extended greetings from the Assembly at the formal opening of the Annual Meeting. Miss E. Louise Seymour, R.R.L., our Record Librarian, was moderator of the panel discussion on "The Medical Record Librarian and hospital accreditation". Mr. Raymond V. Kinsman, Superintendent of Works at M.G.H., was a member of the panel on the Laundry Problems and Opinion Clinic; and Mr. William J. MacNair, our Superintendent of Housekeeping, gave a very interesting description of how a unit (or room) is completely cleaned upon discharge of a patient and made ready for the next patient in 30 minutes' time.



The Board of Trustees, at their meeting on March 12, voted to appoint:

Dr. Charles M. Fisher as Associate Neurologist, effective July 1;
Dr. Robert W. Loehning as Assistant Resident on the Anesthesia Service, beginning September 1, 1955;
Dr. Alexander S. Nadas as Assistant Physician to the Children's Medical Service, effective April 1;
Dr. Nils Normann as Assistant Anesthetist, effective March 1;
Dr. LaRue W. Owen as Senior Fellow in Anesthesia, beginning July 1.

At their meetings during March, the General Executive Committee voted:

To promote:

Dr. Richard B. Kearsley to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. John F. Radebaugh, Jr. to the position of Assistant Resident on the Children's Medical Service for one year, beginning July 1;
Dr. Jack H. Rubinstein to the position of Assistant Resident on the Children's Medical Service, beginning July 1.

To reappoint:

Dr. David V. Mann as Clinical Fellow in Dermatology for one year, beginning January 1;
Dr. Myron H. Matz as Graduate Student Assistant and Clinical Fellow in Dermatology for one year, beginning January 1;
Dr. James F. Patterson as Clinical Fellow in Dermatology for one year, beginning January 1.

To appoint:

Dr. Daniel M. Bachman as Clinical and Research Fellow in Medicine, beginning July 1;
Dr. George A. Hyder as Clinical Assistant in Orthopedic Surgery, beginning April 1;
Dr. Jean G. Kohn as Clinical Fellow on the Children's Medical Service, effective as of March 15;
Dr. John W. Littlefield as Clinical and Research Fellow in Medicine, effective as of March 1;
Dr. William R. MacAusland, Jr. as Clinical Assistant in Orthopedic Surgery, effective September 1;
Dr. Henning Pontoppidan as Clinical and Research Fellow in Anesthesia, in addition to his appointment as Assistant Resident;
Dr. Gillian M. Poulton as Clinical Fellow on the Children's Medical Service, effective as of the date she obtains a temporary license to practise medicine in this State;
Dr. Elliott B. Sweet as Research Fellow in Orthopedic Surgery for one year, beginning July 1;
Dr. André Tetu as Clinical Fellow in Medicine, beginning July 1;
Dr. Alejandro K. Yerkovic as Clinical and Research Fellow in Medicine, as of March 1.

PLASTIC CLINIC — 1954

Dr. Churchill is not infrequently quoted as saying that surgery began with congenital anomalies and trauma and may end with congenital anomalies and trauma. Perhaps the current attention to malformations of the heart and great vessels and the changing concepts of infection are indications of a trend. This poses a question, of where surgeons primarily concerned with congenital anomalies and trauma belong in a teaching institution such as the Massachusetts General Hospital. Among those concerned with these problems are the members of the Plastic Clinic.

The Plastic Clinic at the M.G.H., which was started over thirty years ago by Dr. Varaztad H. Kazanjian, continues to be the meeting ground of interested staff members and visitors. These sessions are always stimulating, despite the declining number of new patients referred to the Clinic and the decrease in follow-up visits. However, the activities of the members of the Clinic are not reflected in the Clinic census because of frequent formal and informal house consultations. Unfortunately, these consultations may be last-minute conversations concerning technical problems of only immediate concern. Opportunities for preliminary discussion, study, and planning with the house surgeon assigned to the operation, and opportunities for long-term follow-up and better evaluation of results are seldom possible. As a consequence, the development of a solid foundation of principles to guide the efforts of the young surgeon and the establishment and maintenance of the highest standards of accomplishment have often proved difficult. This is largely because supervision of seven different groups of residents in the several operating rooms, wards, and clinics gives little opportunity for close and helpful association with each group.

To remedy this, the patient is now followed post-operatively in the residents' clinic by the resident responsible. This plan has stimulated greater interest than if the patient were followed in the Plastic Clinic only. It is to be hoped that similar opportunities for pre-operative planning may eventually be arranged. The complicated multiple-stage reconstructive procedures offer few opportunities for planning and continuity of care because of frequent changes in the delegation of resident responsibility.

The open wound seems to be a constant problem on all services, judging by the number of requests to the members of the Plastic Clinic for advice about management. It seems unfortunate that somehow there is not a more general awareness of the current knowledge of the local and general factors influencing the condition of the wound. It is distressing to see the delays in healing and the development of avoidable complications which result from the discarding of a well-tried method in favor of a less effective substitute for the care of the wound.

In the report of the activities of the Plastic Clinic made several years ago, the following concluding statement was made: "It is the responsibility of the Plastic Clinic to see that the broad concepts and the technical details of plastic surgery are taught to the new generation of house officers." Fortunately, these efforts have borne fruit by the increasing awareness of these concepts by each new generation of house officers and residents.

Bradford Cannon, M.D.,
Head of Plastic Surgery Clinic

Brief bits:—

Dr. Benjamin Castleman gave a series of five lectures and one Clinical Pathological Conference on bone and joint pathology at the Postgraduate School of the University of Havana, Cuba, during the week of March 15. The lectures were attended, for the most part, by radiologists, orthopedic surgeons, and pathologists. Dr. and Mrs. Castleman were happy to renew friendships they had made on a previous visit three years ago and to see many former MGH fellows and visitors.

Dr. Earle M. Chapman was lecturer at the Sommer Memorial Lectures, given in April at the University of Oregon Medical School, in Portland, Oregon. His subject was "Isotopes in Medicine".

On January 18, Dr. Edward D. Churchill received word from Cuba that he had been elected Honorary President of La Asociación de Ecritores y Artistas Americanos and El Instituto Nacional de Previsión y Reformas Sociales.

Dr. Isaac V. Manly (*E.S.* 1947), announces the opening of his office for the practice of General and Thoracic Surgery, at 2021 Clark Avenue, Cameron Village, Raleigh, North Carolina.

Dr. J. Gordon Scannell, with Dr. Theodore L. Badger, spoke at the Middlesex West Course in General Medicine on March 17. Their subject was "Recent developments in the management of chronic pulmonary disease". The course was conducted by the Postgraduate Medical Institute, at the Milford Hospital in Milford, Massachusetts.

A card from Dr. David W. Williams (*W.S.* 1943) says his present address is 111 Dahl Circle, Van Horne Park, El Paso, Texas. He is enjoying a stint in the Army and is exploring the Southwest.

MASSACHUSETTS EYE & EAR INFIRMARY

The Infirmary has welcomed to its staff of ophthalmic residents Dr. Raymond D. Sudarsky, who took up his duties on March 1. Dr. Sudarsky received his Bachelor of Science degree in 1946 from Yale University, and his Doctor of Medicine degree from Yale Medical School in 1949. He interned in the Medical Service at the New Haven Hospital from January 1950 to June 1951, prior to his application for residency here at the Infirmary. At the time of his appointment to our Ophthalmology Service, Dr. Sudarsky was called into the Navy, from which he was discharged last January.

On Tuesday, April 20, Dr. Frank B. Walsh, Associate Professor of Ophthalmology at the Johns Hopkins University and Hospital, delivered the Howe Lecture of Ophthalmology at the Harvard Medical School. His subject was "A clinical study of several third nerve lesions". This lecture was given under the auspices of the Howe Laboratory of the Infirmary.

The New England Ophthalmological Society held its 418th Meeting here at the Infirmary on Wednesday, March 17.

The meeting consisted of an operating clinic held for staff members from 9 A.M. to 12; a presentation of cases from 2 to 3:30 P.M. by Dr. Peter Beck, senior resident; a lecture from 3:30 to 4 by Dr. Henry F. Allen on "The selection of bacteriostats for ophthalmic collyria"; and from 4 to 5 Dr. George B. Corcoran spoke on "A procedure for cataract extraction" (routine zonular stripping). In the evening, a business meeting was held at 7:30, followed by two lectures — Dr. David H. Scott speaking on "Some observations on the problem of aphabric corrections", and Dr. Georginana Dvorak Theobald, from Oak Park, Illinois, discussing "Post-cataract complications".

The New England Oto-Laryngological Society held its Annual Meeting on April 21 in the Upper Amphitheatre of the M.G.H. The morning sessions included a Woodman operation for abductor paralyses of the vocal cords by Dr. DeGraaf Woodman of New York City, and a clinical conference with Dr. LeRoy A. Schall presiding.

Following a luncheon in the Infirmary cafeteria, Dr. John A. Murtagh, President of the Society, presided over the afternoon activities, which included a lecture by Dr. Woodman on "The functional preservation in laryngeal cancer surgery"; a motion picture on "One stage operation for radical resection of the cervical esophagus and larynx with immediate reconstruction", shown by Dr. John J. Conley of New York City; a discussion by Drs. Edgar M. Holmes and Anthony Zovickian; and lectures on "The lateral fistulae of the neck" by Drs. George F. Reed and Yunis M. Sa'eed, and on "Osteomas of the paranasal sinuses" by Drs. Joseph Lentine and Yunis M. Sa'eed.

The American Board of Otolaryngology Examinations will be held at the Infirmary, for the first time since 1934, during the week of May 17. Approximately 100 candidates from all over the United States and Canada will attend.

The oral quiz will be given at the Hotel Statler, the clinical examination at the Infirmary, and the histopathology examination at Harvard Medical School's Department of Otolaryngology.

At the Pan American Otorhinolaryngological Congress, held in Mexico City on March 2, Dr. Daniel E. Martinez presented a paper titled "Method of approach and observation on the circulation of the spiral ligament and stria vascularis of living guinea pigs". The paper was illustrated by a 16 mm. motion picture film which was prepared by Drs. Francis L. Weille, Daniel E. Martinez, and John W. Irwin.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

THE CLASSIFICATION OF MATERIAL STILL CONTINUES TO BE OMITTED IN SOME INSTANCES. It causes your editor considerable time and trouble when you fail to include that information.

Your title should be classified with respect to the subject matter and not under the Hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The January 1954 issue of *Archivos Médicos de Cuba* was dedicated to the Massachusetts General Hospital, and contains the history of the Hospital by Dr. Charles L. Clay and a series of papers from the Thyroid Clinic arranged for by Dr. John B. Stanbury. Since 1953 marked the 40th anniversary of the Thyroid Clinic, the first paper of the series was a history of the Clinic by Dr. Stanbury. The material was collected by Dr. Benjamin Castleman, who had been appointed by the General Executive Committee to act as Editor for this issue.

The articles by our staff members, submitted in English and published in Spanish, are:

Clay, C. L.
  Historia del Massachusetts General Hospital, pp. 2-5.
Stanbury, J. B.
  La Clínica Tiroidea del Massachusetts General Hospital, pp. 6-7.
Stanbury, J. B.
  El tratamiento del carcinoma del tiroides, pp. 8-12.
Maloof, F., and Stall, B. G., III.
  Algunas alteraciones endocrinas en la enfermedad de Graves, pp. 13-15.
Barzelatto, J.
  El yodo en el hipertiroidismo, pp. 16-18.
McDermott, W. V., Jr., and Morgan, W. S.
  Carcinoma a células alveolares del tiroides, pp. 19-22.
Chapman, E. M.
  Radiación interna del tiroides normal para el alivio de la insuficiencia cardíaca crónica, pp. 23-26.
Lerman, J.
  Los componentes yodados de la hormona tiroidea y sus relaciones con la actividad calorigénica, pp. 27-29.
Quinby, W. C., Jr., and Morgan, W. S.
  Clínico-Patológicos Semanales, pp. 30-33.

Other new titles received are:

General Medicine

Chapman, E. M., Maloof, F., Maisterrena, J., and Martin, J. M.
  Ten years' experience with radioactive iodine.
    J. Clin. Endocrinol. & Metab. 14:45-55.

General Surgery

Nardi, G. L.
  Urinary loss of amino acids after surgery.
    Surgery 35:378-381.
Scannell, J. G.
  Emergencies of the lung and esophagus.
    J.A.M.A. 154:903-904.

Nursing Education

Sleeper, R.
  Stretching the nurse.
    Hospitals 28:80-81; 184; 186.

Ophthalmology

Dunphy, E. B., Dreisler, K. K., Cadigan, J. B., and Sweet, W.
  The uptake of radioactive phosphorus by intraocular neoplasms.
    Am. J. Ophth. 37:45-54.

Otolaryngology

Kelemen, G.
  Fenestration of the labyrinth: A bibliography.
    Cambridge, Mass., Psycho-Acoustic Lab.
Kelemen, G.
  Histological test of tonsillar activity based on the reticuloepithelial interplay.
    A.M.A. Arch. Otolaryng. 59:263-281.

Miscellaneous

Beecher, H. K., and Ford, C.
  Some new letters of Horace Wells concerning an historic partnership.
    J. Hist. Med. & Allied Sc. 9:9-20.

REPORT ON EXAMINATIONS FOR NEW ENGLAND GAS AND ELECTRIC ASSOCIATION

A group of 53 executives of the New England Gas and Electric Association were examined by physicians on the Staff of the Massachusetts General Hospital. Fifteen internists cooperated in the procedure, which was under the general supervision of one of the senior physicians of the Staff. The plan was that each person would be the complete responsibility of a particular physician, whom he chose from the roster. If he made no choice, the physician was assigned. Accordingly, each patient was given a thorough initial examination by the selected or assigned physician, with certain routine laboratory tests, and was subsequently seen for a shorter period of time on a second occasion. The actual time spent by an examining physician with an individual patient approximated one and three-quarters to two hours. The compensation of the examining physician was $35.00 per case. A detailed report was sent in every instance to the patient's own physician if he had one. In addition, verbal advice or suggestions were given where special problems presented, and a shorter, much less technical report was given to each individual patient.

In those instances where additional laboratory tests or consultations were needed, these were arranged for. In all, 17 consultations were held with other members of the Staff of the Massachusetts General Hospital, and involved ophthalmologists, urologists, an orthopedic surgeon, dermatologists, hematologists, and a cardiologist. Routine x-ray examinations included only films of the chest and heart and were combined with an electrocardiogram in each case. Thirty-five additional x-ray examinations were made in order to further study the digestive tract, joints, chest, bones, kidneys, and teeth. These were done on the basis of special indications that became obvious to the examining physician during the initial examination. In addition, a moderate number of other laboratory examinations were made as the occasion required, for further information not originally supplied by the routine blood, urine, and stool examinations that were obtained at the time of the first interview. In all, 19 such special tests were made.

The Association assumed financial responsibility not only for cost of the routine examination and procedures but for all supplementary procedures and consultations which the examining physician might, at his discretion, order.

All of the examinations were conducted during morning hours in a section of the Baker Memorial Building and, for the most part, were conducted without undue delay or difficulty, especially after the first few individuals had been examined. An attempt was made to make each examination a careful personal procedure in which the physician discussed all the necessary matters that pertained to past history or living habits, as well as to any current complaints.

Administrative and secretarial services were provided by the M.G.H. and, except for minor deficiencies which can be corrected, were satisfactory.

The results of the examinations are of some interest. The average age of the group was 51½ years, ranging between 39 and 62 years. The average weight of the patients was 173 pounds, with a range of 125 to 232 pounds. It is quite obvious that the entire group was distinctly overweight, inasmuch as there were 27 individuals who weighed more than 175 pounds and 7 who weighed over 200 pounds. This is one important general finding. The average blood pressure for the entire group was entirely normal — 134/81, with a range from 105/70 to 205/130. There were 12 individuals who had a systolic pressure over 150, and 6 who had a diastolic pressure over 100. In the main, it can be said that there was relatively little evidence of hypertension and only 2 instances of serious hypertension. There were 5 individuals who showed abnormal electrocardiograms, and 5 additional ones whose electrocardiograms were borderline. Routine chest films showed moderate lung changes diagnosed as being consistent with emphysema in 10 of the patients. No patient showed evidence of active pulmonary disease, although in one the x-rays were rather suggestive of bronchiectasis (chronic bronchitis). Enlargement of the heart was seen in only 2 cases by x-ray.

Laboratory data indicated that there was in no case any suggestion of anemia. In fact, taking 15 grams percent as a normal level for hemoglobin for adult males, the average in this group was 15.6 grams, with 21 persons having a hemoglobin level of over 16 grams percent. A few individuals had a slight elevation of white blood count, usually in association with a recent or mild infectious process. Only 1 patient had a high blood sugar and could be classified as a diabetic. In 2, there was a suggestion of potential diabetes. In view of the average obesity of the group, it is not surprising that some moderately high blood sugars were obtained. In only 1 case was there any proven disease of the kidneys, but in 3 instances kidney stones were suggested by special x-rays.

Either by history or physical examination, or by special tests, various abnormal conditions were found of varying degrees of importance. Outstanding was the fact that 27 individuals, or one-half of the group, could definitely be classified as obese, with 10 having very moderate hypertension, probably transient in nature, and 2 having persistent hypertension. Ten patients had emphysema without any symptoms; 1 probably had mild bronchiectasis; and 4 patients had some involvement of the sinuses. Two patients had organic heart disease, and in both this had previously been recognized. Four gave a definite history of allergic disturbances related to the presence of asthma or hay fever. Five had minor skin lesions. As noted above, 1 patient was a proven diabetic, and in 2 others the suspicion was raised of mild potential diabetes. Gallstones were demonstrated in 1 individual; 1 patient had an ulcer; 1 patient had ulcerative colitis, which had already been diagnosed and was being treated; 1 patient had a hernia; 1 had a rectal polyp which was recognized for the first time and treatment was advised. Back conditions leading to orthopedic advice were noted in 3. In 1, there was a question of brain tumor; this patient, of course, is to be followed. In 1 instance, there seemed to be some enlargement of the prostate, but this was benign and proper advice was given. Varicose veins, phimosis, and labyrinthitis were noted respectively in 3 individuals. There was a question of gout noted in several cases; in 1 case there was the possibility of a mild gouty arthritis being present.

It is obvious from this analysis that certain physical abnormalities were revealed by the examinations. In many instances, these abnormalities had not previously been noted. In certain instances, disease processes had been recognized for some time and were confirmed and checked at this examination. Minor disturbances were re-evaluated. With two or three exceptions, no serious disease was encountered which required careful follow-up or immediate treatment. Where advice was indicated, this was always given and then reported to the patient's own physician. Except for individual difficulties, it would seem that the most important single finding for the entire group was that of definite overweight, probably due to overeating, with its attendant potential dangers for the future.

These general findings and conclusions were presented to the Association for its information and guidance. Naturally, no individual case was discussed.

After the examination was completed, the entire experience was discussed by the examining physicians, who at that time made suggestions for improving the program, without adding any important new methods of investigation except where special indications existed. The participating physicians voiced general satisfaction with the professional, financial, and administrative aspects of the venture and expressed their willingness to conduct repeat examinations of this group a year hence. It would be hoped that the examinations would be repeated on the same individuals by the same examining physicians in approximately a year's time, under more or less the same conditions. The second and subsequent examinations, however, should, in the main require less time, except where new symptoms might appear or where old symptoms or previously recognized abnormalities had already been discovered and had to be checked.

The Association was more than pleased with the results and have stated that they have every intention of making the program a permanent one.

A copy of the above report was sent to each member of our Visiting Staff and Board of Consultation. An accompanying letter from Dr. Dean A. Clark said, in part:

> . . . The General Executive Committee has concluded, after a review of this experience, that annual examinations can be conducted on

> a high professional level, consistent with the standards and traditions of the M.G.H. It is prepared to undertake the sponsorship of other such programs under similar supervision until such time as the Massachusetts General Staff Associates shall come into being, provided a sufficient number of the Staff wish to participate.
>
> The first program was undertaken with a group of fifteen internists. Now that the study has been successfully completed, it is appropriate to invite wider participation of interested members of the Staff in similar anticipated projects. Accordingly, this letter is being sent to every member of the Visiting Staff and the Board of Consultation, since future examinations will be conducted by internists and by consultants on the roster of the Hospital who are called in by examining physicians as indicated.
>
> . . . If you are interested, we will place your name on a roster for use in future cases.

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

The Spring Meeting of the MGH Staff Wives Hospital Committee took place on Wednesday morning, May 5, in the living room of the Walcott House. All members had been cordially invited to attend. Coffee was served at 10 A.M., after which the business meeting got under way.

The Nominating Committee proposed the names of candidates for the next Executive Committee. The names of those elected will appear in a future issue of The News.

Mrs. Muriel McL. Miller addressed the group after the election of officers.

The final tea for visitors to the M.G.H. from abroad was held on Tuesday, April 6, in the Medical Staff Room of the Bulfinch Building. As usual, this popular function was very well attended. Staff Wives who would like to be present at these teas in the future should notify the Hospitality Chairman.

The date set for the annual picnic at the Cannon home in Lincoln is Saturday, May 22. Further details will be contained in the invitations, which will be mailed to visiting and house staff members, visitors from other lands, clinical and research fellows, and their respective families.

Once again we are requesting donations of recent and popular magazines, as well as books, for distribution to patients in the Hospital. The need is constant and demanding. Anyone who can contribute is asked to leave his periodicals and books at the front desk of the White Building.

Mrs. Sweet, who is in charge of the Furniture Exchange, will be out of town from April 26 to June 16. During this period Mrs. Burbank will be in charge. She may be reached at BEacon 2-1648.

Concerts in the Chapel, for ambulatory and wheel chair patients, still continue, under the able direction of Mrs. Abraham L. Finesinger.

On April 21, Miss Esther Elman of New York City, sister of the famous violin virtuoso Mischa Elman, presented a program of lovely piano music. It was highly appreciated by all her listeners.

On May 19, Margaret Reid, violinist, will present a half-hour of music.

On May 26, the New England Conservatory Musical Theatre will send a group of young performers to present for the patients' enjoyment excerpts from "Oklahoma" and other light operas.

Distaff Club

Members of the Distaff Club had a very enjoyable evening at the Museum of Fine Arts of Boston on March 30. The tour was conducted by Miss Morna Crawford, who is associated with the Educational Department of the Museum.

The Club held a food sale on April 28, in the Brick Corridor of the Hospital, to augment the present funds in the treasury. Mrs. William D. Cochran acted as chairman for the sale, and the results were most gratifying.

BIOGLETS

Dr. James L. Vanderveen, Assistant Resident in Anesthesia—born in Ravenna, Ohio, January 14, 1927; U.S. Navy: Hospital Corps, in United States, 1944-46; attended Vanderbilt University, Nashville, Tennessee, 1946-48; M.D., Harvard Medical School, 1952; Intern, George Washington University Hospital, Washington, D. C., 1952-53.

Dr. Frederick E. Whiskin, Resident in Psychiatry—born in Cupar, Saskatchewan, Canada, February 9, 1925; B.A., University of Saskatchewan, 1945; M.D. and C.M. (Master of Surgery), McGill University, 1948; Intern, rotating, Maine General Hospital, Portland, Maine, 1948-50; Resident in Psychiatry, McLean Hospital, Waverley, Massachusetts, 1950-52; Assistant Psychiatrist, McLean Hospital, 1952-53; Assistant Resident in Psychiatry, Queen Mary Veterans Hospital, Montreal, Canada, February through June 1953.

Recently we published a long list of names of MGH-ers from whom mail had been returned to us, bearing such notations as "Unclaimed", "Unknown", etc. We asked if anyone could tell us the present address of any person listed. We received several responses to our appeal, for which we are very grateful.

Six more letters (all bearing 1st class postage) have been returned to us, and we are again asking if anyone can help us locate these people. Please send such information to Cora F. Holbrook, Archivist and Editor of The News.

Here are those six names, with last known addresses:

Clapp, Stewart (*N.S.* 1939), 1926 West Superior St., Duluth, Minn.
Kind, Henry A. (*C.M.* 1935), Tilton General Hospital, Fort Dix, N. J.
Legge, Robert F. (*Or.* 1935), U.S. Naval Hospital, Great Lakes, Ill.
Salamanca, Juan J. (*An.* 1943), Carrera 15, No. 15-34, Bogotá, Colombia
Weigel, Edgar W. (*Or.* 1928), 970 Park Ave., Elizabeth, N. J.
Wies, David (r.p. *Psychiat.*, McLean, 1938), 8702 Lock Bend Drive, Towson, Md.

New addresses:—

Lt. Harry A. Bliss, MC, USNR (*M.* 1945), Philadelphia Naval Hospital, Philadelphia, Pa.
Dr. David W. Compton (r.p. *An.* 1946), 1117 Harvard Ave., Seattle, Wash.
Dr. Harold E. Elrick (*M.* 1944), 1055 Clermont St., Denver, Colo.
Dr. Joseph J. M. McGovern (a.r.p. *C.M.* 1954), Children's Medical Center, Boston, Mass.
Dr. Philip E. Meltzer (s. *Otolar.*), 285 Commonwealth Ave., Boston, Mass.
Dr. Russell M. Nelson (a.r.s. 1954), 848 20th Ave., S.E., Minneapolis 14, Minn.
Dr. John S. Robey (*C.M* 1953), Tacoma Indian Hospital, Tacoma, Wash.
Dr. Robert B. Sloane (r.p. *Psychiat.* 1953), 24 Shawville Gardens, Ilford, Essex, England
Major George H. Sweetnam (*Dn.* 1937), 5th General Hospital, APO 154, c/o Postmaster, New York, N. Y.

Our "singletons" have been very cooperative in their responses to our appeals for news from them. Here is a letter from Dr. William G. Kuhn, Jr. (a.r.s. *Or.* 1949), from New Brunswick, New Jersey:

> This is in reply from one who is very proud to bear the distinction of being the only MGH-er in my town.
>
> After leaving the Orthopedic Service of M.G.H. in 1949, I spent an additional year as chief resident of the Sixth Surgical Service at Boston City Hospital. In 1950 I returned to my own home town, feeling that the best time to find that the grass was greener on the other side of the fence would be at the beginning of my professional career.
>
> I am very happy that I made the choice to return to my home town, in spite of the fact that I am without companionship with another MGH-er. I have been in the practice of Orthopedic Surgery here in New Brunswick since 1950 and find I do miss the intellectual as well as the social advantages of Boston. Mrs. Kuhn, too, misses the Boston touch, but with four active children to care for, she has not had much time to worry about it.
>
> At the present time I am on the staffs of the two hospitals in New Brunswick, St. Peter's and Middlesex, as well as that of a Rehabilitation Hospital which has recently been started by interested professional men of this town. In addition I journey to Princeton one day a week, where I am associated with a medical group as their Orthopedist. It is strange to be with this group, since they were all trained in New York and here again I am the only MGH trained man in the area.
>
> One advantage of being a "singleton" is that you really appreciate the comradship of those from M.G.H. whenever you meet them again at conventions.
>
> I look forward to and enjoy the regular news from M.G.H. Both Mrs. Kuhn and I take great pleasure in following the progress of those we knew when I was in training at M.G.H. and of those who go out into the world to spread the gospel.

Dr. Ralph W. Walton (*W.S.* 1926), our "singleton" in Montclair, New Jersey, has sent us this nice letter:

> Though I have had to delay the reply to your recent letter, it is a privilege to comply with your request for news from an MGH "singleton". For my twenty-eight years in Montclair, I have tried to live up to that unique opportunity, although I had thought little about the "singleton" idea before your letter made the observation.
>
> Montclair is a beautiful residential city of about 40,000, lying in northern New Jersey about fifteen miles from 42nd Street and Broadway. It forms one of a community of towns such as Bloomfield, Glen Ridge, the Oranges, Verona, the Caldwells, etc. Combined, these towns form a section of Greater New York, lying just beyond the Palisades of the Hudson.
>
> Transportation facilities are excellent. Be-

NO. 47 IN A SERIES OF STAFF PHOTOGRAPHS
DR. HARRIET L. HARDY — ASSOCIATE PHYSICIAN

sides two railroads there are busses running on the hour or half hour, with a 40 to 36 minute schedule, between Montclair and the Port Authority bus terminal at 41st Street and 8th Avenue. Two super-highways also connect Montclair and vicinity with New York via the George Washington Bridge, and the Hudson and Lincoln tunnels.

Medical practice is very active here and I have found to be true the words of an old doctor whom I met on my first arrival in Montclair: "There is plenty of work here for a young man who is willing to do it." Although now surrounded by a "sea" of specialists (most of whom are very good) I always have been content with the title of "general practitioner" with an active interest in general surgery. This, however, I am gradually giving up along with obstetrics, for the somewhat less strenuous work in the office — which, by the way, I now am limiting to three days a week.

Since leaving the M.G.H. in October 1926, I have remained in Montclair — for the past twenty years at my present location. My home and office are so arranged that the office functions as a separate unit from the home.

Patients frequently inquire about the 10 by 36 inch panoramic view of the M.G.H. which hangs on the wall of my consultation room. They always seem interested in a bit of its history and like to learn about the old Ether Dome which is shown in the center of the picture.

Here is a news item which may interest some of the men of H.M.S. '24 who see THE NEWS. A friend and former patient who now lives in Tryon, North Carolina, recently met Dr. Worth Hale, former Dean of H.M.S., who has been spending the winters in Tryon. A few days ago I received a very nice letter from Dr. Hale, who seems to be well and active. He reports a home address of Antrim, New Hampshire, but states that he and his wife still go to Maine in the summer.

Our one son, Ralph, Jr., aged 22, graduated from Harvard College last June. He has been deferred by the military service for study and is now taking postgraduate work in experimental psychology at George Washington University, Washington, D. C.

My personal ambition calls for a drastic curtailment of a very active practice, to take some time out in the future for a bit of travel which I have thought much about in the past but, perhaps unwisely, have done little of.

One hobby which has given me much pleasure and which I hope to continue is the making of originally designed antique type of furniture in my basement workshop. I never make two pieces alike and never am satisfied with the amount of time available for this activity.

Gardening is another avocation which furnishes no end of interest, but with little leisure time to pursue it. In the future I hope to do more of it and perhaps may be able to grow some super-delphiniums and snapdragons. Last spring some of my Pontiac Darwin tulips measured 36 inches in height.

And so life goes on at a quickening pace, with each year appearing a bit shorter than the one before, with an increasing number of things to do and seemingly less time in which to do them.

Each month I read THE NEWS eagerly. I would like to say hello to several of my classmates who interned at the M.G.H., some of whom are still connected with it.

This letter has come from Dr. Ching Tung Liu (r.s. *N.S.* 1946):

I regret that I shall not enjoy very much longer the distinction of being the only MGHer in Canandaigua. The Veterans Administration is transferring me to a new post as Chief of the Neurosurgical Service at the Veterans Hospital in Oakland, California, in March.

Since my happy days at M.G.H., we have had two additions to our family — Linda, aged 7, and David Jason, aged 3.

Canandaigua has a climate very similar to Boston's, in that it is very cold and "snow-ful" in winter, but the summers are delightful. However, California may be even more attractive if all we hear is correct.

Best wishes to all our MGH family.

* * *

One of the year-round, day-by-day projects in the Hospital is the renovation and redecoration of different areas. For the most part, these changes are taken for granted by many, sincerely appreciated by those immediately affected by them, and unnoticed by the large majority.

Not so, however, the recent redecoration of the waiting rooms and corridors on the first floor of the Baker Memorial. For the past three months the changes taking place in this area have become the conversation piece of the entire Hospital. The pros and cons have been loudly voiced by the passers-by, beginning on the day the brilliant, modern multicolor design was painted on the end doors of the lounge, continuing during the application of the soft tones to the extensive wall space, rising violently with the introduction of furniture temporarily on loan from the Out-Patient Department, and reaching a climax at the prospect of a bamboo curtain extending the length of the room.

Over night the transformation came. The lovely broadloom rug was laid, the colorful, comfortable, permanent furniture was installed, the bamboo curtain was hung, and the pros and cons merged into expressions of surprised delight at the harmonious result.

Perhaps the greatest tribute to those responsible for the transformation is to be found in the obviously improved comfort of the patients and visitors whose moments of waiting in the lounges are usually troubled ones.

The redecoration of the large waiting room in Baker is but one part of the work presently going on; but, because its location has attracted such wide attention, it has been selected as a typical illustration of the efforts that are constantly being made to improve the atmosphere of the Hospital for the benefit of the patients.

THE NEWS

MASSACHUSETTS GENERAL HOSPITAL 1811

No. 135 Boston, Mass. June 1954

NEUROSURGICAL SERVICE

Since the last Neurosurgical Service report appeared in the December 1951 issue of THE NEWS, Dr. William Jason Mixter has retired from practice. Although he ceased being Chief of the Service in 1941 because of the early age limit on the part-time visiting staff, he headed the Service again during much of the war period and carried on an active practice in the Phillips House and Baker Memorial until last summer. Dr. Mixter was the first to specialize in neurosurgery in this Hospital and, with the exception of Dr. Harvey Cushing at the Peter Bent Brigham Hospital, was the pioneer in neurosurgery in New England. His scientific contributions and his personality made him an outstanding figure that won the esteem and enduring affection of all who were privileged to work with him.

The Service is trying a new program for training residents — taking on two men a year for a three-year period. Instead of having three men progressing through the general and private wards of the M.G.H., we now have each man spend a year of his required training to meet the American Board standards on Dr. Drew's service at the new V.A. Hospital on South Huntington Avenue, as well as six months in neuropathology here under Drs. Raymond D. Adams and Edward P. Richardson. This supplementary training, in addition to a previous period that many of our residents spend as research fellows in the experimental laboratory, should give our graduates an unusually well-rounded training. We believe that this will be a great help to them, as good opportunities for young neurosurgeons to practise are becoming increasingly difficult to find, owing to the competition from the large number of training centres in the United States.

The development of a research laboratory on the 4th floor of the White Building was described in the last report. Still further opportunities for investigation of the nervous system have been opened up in association with the new laboratories developing in neurology under Dr. Raymond D. Adams and in physics under Dr. Gordon Brownell.

Current work of interest includes the following subjects:

Formation and absorption of spinal fluid: This is being investigated by Dr. William Sweet and Dr. Herbert Locksley by means of isotopically labelled water, electrolytes, and protein. These new methods have shown that it is necessary to revise many of the older concepts of secretion of cerebrospinal fluid by the choroid plexus and its absorption in large part by the arachnoid villi over the convexity of the hemispheres. It has become evident that the elements of the cerebrospinal fluid are exchanging with the blood stream throughout the ventricular system and the pia over the entire extent of the brain surface and spinal cord. Only the protein appears to require escape from the cerebral ventricles in order to be absorbed at a sufficiently rapid rate to maintain a balance between production and absorption.

Localization of brain tumours: The original work on localization of tumours deep in the brain by their concentration of the beta-emitting isotopes of phosphorus and potassium (Selverstone, Solomon, and Sweet) and their detection by a tiny probe Geiger counter (Robinson, Selverstone, and Solomon) has already been described in THE NEWS. As a supplement to this valuable procedure Dr. Sweet and Dr. Brownell have devised a more simplified and accurate method of extracranial localization. Previous methods used elsewhere depended upon a laborious comparison of numerical counts of gamma particle emission (radioactive I^{131}) from many areas of the head. A group of radioactive isotopes which emit positrons has been shown by animal experiments to have peculiar advantages for this purpose (Locksley, Dow, and Lepoire). These observations made in our laboratory on mice have been corroborated in our patients with tumours of the brain. Dr. Brownell has devised an efficient automatic device for scanning by which the concentration of counts is reproduced on an outline of the head. The surgeon is thus given graphic evidence of the position of a tumour within the skull comparable to an x-ray film or a pneumogram or arteriogram. On the basis of increasing confidence in the reliability of these scans, we are more frequently able to avoid the risk and discomfort of injecting air into the ventricles or opaque solutions into the carotid artery.

Treatment of brain tumours by internal radiation: Drs. Sweet, Brownell, Locksley, Aronow, Luessenhop, and Edwards have utilized the tendency of certain isotopes to concentrate within a brain tumour and then, on exposure to a beam of slow neutrons, to disintegrate with the release of highly destructive radiation. These particles travel but a few millimeters from the site of disintegration and thus confine the greater part of their lethal energy to the tumour cells. The concentration of suitable isotopes in brain tumours has been studied in our laboratories and the patients have been exposed to a beam of slow neutrons from the nuclear reactor at the Brookhaven National Laboratory by Dr. Lee Farr and his associates. The first group of patients so treated a year ago showed the need for heavier radiation, but with the nuclear reactor rebuilt to produce twenty-fold more slow neutrons the results may become really effective and open up a new method of treating these difficult lesions.

Studies on the blood-brain barrier: Here again radioactive isotopes are proving to be a more effective method of investigating the permeability of cerebral blood vessels and the penetrations of various substances from the cerebral capillaries into different portions of the brain. Dr. Louis Bakay has been working in this field, observing the penetration of isotopically labelled particles by contact exposure of slices of fresh brain tissue on sensitive photographic films. These show that, under normal circumstances, the brain is prevented by a barrier from absorbing anything but minute quantities of radioactive phosphate from the blood circulation. This barrier is probably located in the wall of cerebral capillaries. If the isotope is injected directly in the cerebrospinal fluid and the barrier is thus by-passed, large amounts of P^{32} are rapidly incorporated into the central nervous tissue. However, certain vegetative centres of the brain behave in a different fashion. Furthermore, the barrier for P^{32} is destroyed by various processes, such as trauma, haemorrhage, or tumours, and it is hoped that new information can thereby be gained regarding the disturbed cerebral metabolism in these disorders. It should also be possible to investigate the distribution of "tagged" therapeutic substances by similar methods.

Studies on the effects of ultrasonic radiation: Dr. Thomas Ballantine is presently collaborating with the Army Neurophysiological Laboratory in exploring the destructive action of high intensity ultrasound. By employing a focused beam it may be possible to destroy certain areas deep within the brain of experimental animals without affecting the tissue in the path of the beam above the focal point. If successful, this method of producing lesions in the central nervous system should be of value in neurophysiological investigations and may have some applications to patients as well, perhaps in the selective destruction of frontal lobe white matter as a refinement of modern lobotomy techniques.

Along more clinical lines the following problems are being studied:

Pressure gradients in the cerebral arteries: Following their initial study of pressures in the internal carotid artery after ligation of the common made seven years ago, Dr. Sweet and Dr. Bakay have found it possible to record the reduction in pressure in the cerebral arteries distal to the point of ligation. Information of value concerning the comparative effectiveness of ligation in the neck or intracranial clipping is being obtained by assessing the long-term results in patients after operation for intracranial aneurysm.

Production of electrolytic lesions deep in the brain without operative injury to superficial structures: In the surgical relief of abnormal movements and of persistent severe pain it is often desirable to destroy deep nuclei or fibre tracts, but it is important to minimize damage to neighbouring structures. A start toward this goal has been made elsewhere with the use of the Horsley-Clark stereotactic instrument redesigned for use in man and with various forms of electrical lesion-makers. Evaluation of those in current use by Sweet and Mark has shown that they result in lesions which may vary as much as 100 percent in extent and are therefore unsuitable for use in man. Experiments in animals have shown that with currents of higher radio-frequencies it is possible to coagulate tiny or larger areas of approximately constant size. By these means Drs. Sweet, Mark, and White are hoping to develop less hazardous and more effective measures for carrying out selective frontal lobotomy, interruption of the spinothalamic pain tract in the medulla and midbrain, and of other deep structures in the treatment of tremor and abnormal movement. An improved stereotactic instrument has been designed by Dr. Mark for accurate placement of the electrodes in such deep and vital structures as the thalamus and basal ganglia. Dr. Mark, in association with Dr. Yakovlev in the Department of Neuroanatomy at Harvard, is also making a complete cross section atlas of the brain.

Hypothermia and operation on the avascular brain: Operation on some of the arteriovenous aneurysms has carried a prohibitive risk because of exsanguinating haemorrhage. Dr. William Lougheed, here for a year from the Department of Neurosurgery in Toronto, has helped us adapt for human use the experiments made in his medical school's Department of Physiology on hypothermia in animals. In this work Dr. W. G. Bigelow showed that general cooling of the body permits shutting off the cerebral circulation for extended periods. This depends on the fact that when the temperature of the brain is reduced its metabolism and the vital need of the delicate nerve cells for oxygen is likewise decreased. Cooling two patients under anaesthesia to 25° centigrade (77° Fahrenheit) has enabled us to (1) remove successfully an entire cerebral hemisphere invaded by a vascular malignant tumour and (2) clip off an arteriovenous aneurysm in the third ventricle. These individuals appeared to have suffered no ill effects from prolonged occlusion of both carotids in the first, and the vertebrals as well as the carotids in the second. The latter unfortunately succumbed to an unforeseen late-developing vertebral thrombosis. This method to permit total circulatory arrest has been used elsewhere in operations on the open heart, and independently on the brain by Mr. Norman Dott in Edinburgh. We are much indebted to Dr. William R. Brewster, Jr., in Dr. Beecher's department, for help with the complex problems associated with anaesthesia and cardiovascular physiology.

Effect of intravenous solutions on cerebrospinal fluid pressure: Following Dr. Allan Butler's suggestion that the routine administration of 5 percent glucose in distilled water for maintenance of fluid balance in postoperative comatose neurosurgical patients might lead to an increase in intracranial pressure, Bakay and White have investigated this possibility with Dr. John Crawford of the Pediatrics Service. By catheterization of the lumbar subarachnoid space and prolonged determinations of pressure with an electronic manometer it has been found that an intravenous drip of 1500 cc. of 5 percent glucose in distilled water is followed by a rise in pressure up to double the preexisting level, whereas no appreciable rise is seen when the glucose is given in half normal saline. As such a small volume of salt solution is well tolerated, this simple observation has led to a distinct improvement in postoperative care.

Relief of chronic pain by neurosurgery: This long-range study which has been in progress since 1927 is still continuing. Observations on 420 patients after various types of denervations, followed for prolonged periods, have been incorporated in a book by White and Sweet which is soon to be published by Charles Thomas.

As noted in the previous report, the only handicap in carrying out better neurosurgery and more efficient research on the human nervous system at the M.G.H. has been the lack of a properly designed operating room. Our present theatre is too small and improperly ventilated; the construction of the viewing galleries is utterly inadequate to accommodate the necessary recording instruments and the personnel to man them. When these are crowded into the operating room itself there is a serious risk of air-borne infection in the course of prolonged procedures on the exposed brain or spinal cord. We have just been promised that this handicap will be corrected.

James C. White, M.D.,
Chief of the Neurosurgical Service

The following excerpt from the Massachusetts Memorial Hospitals' periodical of March-April has been sent to us:

> Each year the American Institute of Graphic Arts and the Society of Printers choose the 50 best books of the year. Selections are based primarily on appearance, format, typography, and other technical considerations.
>
> This year the *Atlas of pelvic operations,* by Dr. Langdon Parsons of MMH [and M.G.H.] and Dr. Howard Ulfelder [of M.G.H.], was chosen and is the first medical book to be so honored.

The book was published by W. B. Saunders Company of Philadelphia. It was exhibited with other winners at the Boston Book Binders exhibit during April and at the Boston Public Library during May.

* * *

IRA THEODORE NATHANSON

On May 3 Dr. Ira T. Nathanson spoke to the second year Harvard Medical School class on "The natural history of cancer". He completed his lecture, answered questions, and left the lecture hall. A moment later he collapsed and died of a heart attack in the anteroom. Thus ended a life devoted to a quest for the cure of cancer.

Dr. Nathanson came to the Collis P. Huntington Memorial Hospital in 1935 as Littauer Fellow in Surgery. Here in the laboratory he did pioneer work on the identification of sex hormones, and at the same time completed a classic series of clinical studies, with Dr. Claude E. Welch, on the life expectancy of patients with various types of cancer.

In 1940 he was invalided with tuberculosis—which time of enforced rest served to crystallize the form of a book published soon thereafter by Taylor and Nathanson on *Lymph node metastases.*

In the war years his efforts were joined with those of the whole Huntington Memorial group in studies on shock and traumatic infection. These investigations emphasized the role of local fluid loss in converting traumatic tissue damage into outspoken shock, and pointed to the importance of clostridial infections as a complication of severe trauma.

The then current finding of Huggins that cancer of the prostate was favorably influenced by castration or by administration of female sex hormones influenced Dr. Nathanson's thinking, and gave encouragement to his previous hope that cancer of the breast might be similarly influenced by hormones — and so, indeed, it proved to be. Following cautious treatment with female sex hormones of several patients with advanced breast cancer, he was elated to observe unmistakable evidence of regression in certain cases. In pursuit of this finding and its explanation, his life reached a feverish tempo from which it never slackened.

Dr. Nathanson served generously and in many ways in the cause of cancer. He was Cancer Teaching Coordinator of Harvard University and Associate Clinical Professor of Surgery, Associate Visiting Surgeon and Executive Secretary of the Tumor Clinic at the Massachusetts General Hospital, Chairman of the Therapeutic Trials Panel of the American Medical Association, member of the Committee on Growth and Chairman of the Committee on Cancer Diagnosis and Therapy of the National Research Council, Visiting Surgeon at Pondville Hospital, and a moving spirit in the New England Cancer Society. About him grew a laboratory staff skilled in the separation and identification of steroid compounds. On the national scene he stood nearly alone, as an example of fusion in a single individual of the two approaches to the cancer problem — the pragmatic one of the surgeon confronted by a patient with the disease, and the long-range point of view of the laboratory man searching for newer and sharper tools to use in the combat.

Few students could fail to catch the enthusiasm of his lectures. It is fitting that he should have been engaged during the last moments of his life in describing to a new medical generation the gathered experience of his lifetime work.

ul C. Zamecnik, M.D.] P. C. Z.

The Board of Trustees, at their meetings on April 2 and 16, voted:

To promote Dr. William D. Sohier, Jr. to Assistant in Medicine, effective July 1;

To grant leave of absence to Dr. Donald P. Todd because of military service, effective April 15.

To appoint:

Dr. John G. Clark, Jr. as Assistant Resident on the Psychiatric Service, beginning July 1;

Dr. Edward C. Haley as Special Intern for a mixed internship in Medicine, Pediatrics, and Psychiatry, beginning July 1;

Dr. Oscar Hirsch as Consultant in Neurosurgery;

Rev. Kendrick R. Lee as Assistant Protestant Chaplain to the Massachusetts General Hospital;

Dr. Thomas C. Peebles as Chief Resident on the Children's Medical Service for one year, beginning July 1;

Dr. E. E. Pochin of the University College Hospital Medical School, London, as a Richardson Lecturer;

Dr. Mary P. Smythe as Intern on the Children's Medical Service, from January 1 through June 30, 1955;

Dr. John D. States as Assistant Resident in Orthopedic Surgery, beginning January 1, 1955.

To appoint the following Interns for one year, beginning July 1:

MEDICAL

David W. Allen
Frank K. Austen
Gerald M. Edelman
Jan Koch-Weser
Arthur R. Kravitz
Glenn A. Langer
William E. Lassiter
Donald B. Martin
Katharine E. Spreng
Oscar E. Starobin
Pindaros R. Vagelos
Ralph C. Williams

CHILDREN'S MEDICAL

Kazuo K. Kimura
Leonard H. Plotkin
Gerold L. Schiebler

SURGICAL

Arthur E. Baue
David L. Collins, Jr.
Oscar S. DePriest, III
Gilbert Hermann
Alvan B. Judd
Walter E. Klingensmith
Eugene R. Nobles, Jr.
Stuart E. Price, Jr.

At their meetings on April 7, 14, and 21, the General Executive Committee voted to appoint:

Dr. Franca Bonotti as Clinical Fellow in Anesthesia, effective July 1;

Dr. Oswald D. Cinquegrana as Clinical Fellow in Physical Medicine, as of February 15, 1955;

Dr. Herbert C. Mansmann, Jr. as Clinical and Research Fellow in Medicine, assigned to Allergy, beginning July 1;

Dr. Norman L. Paul as Clinical Assistant in Neurology for one year, beginning July 1;

John L. Wood, Ph.D. as Research Fellow in Biochemistry, beginning April 1.

MASSACHUSETTS EYE & EAR INFIRMARY

The Infirmary chose National Hospital Day — May 12 — for the awarding of service pins, for the first time, to members of the professional staff who have served for 25 or more consecutive years on the active staff.

By vote of the Board of Managers, service pins were given to the following doctors: Dr. Paul A. Chandler, Dr. Edwin B. Dunphy, Dr. Benjamin Sachs, Dr. Carl H. Ernlund, Dr. Maurice G. Evans, Dr. Robert L. Goodale, Dr. Charles I. Johnson, Dr. Philip E. Meltzer, Dr. LeRoy A. Schall, Dr. Francis L. Weille, and Dr. Alexander S. Macmillan. The following consultants were awarded pins for 25 or more years of consecutive service on the active staff: Dr. Ralph H. Ruggles, Dr. Frederick L. Bogan, Dr. Edwards W. Herman, Dr. Moses H. Lurie, Dr. George H. Poirier, Dr. D. Harold Walker, Dr. Edmund W. Clap, Dr. Harris P. Mosher, Dr. Frederick H. Verhoeff, Dr. Lyman G. Richards, and Dr. Varaztad H. Kazanjian. Mr. Francis S. Hill, Director of the Infirmary, presented the pins.

Dr. Craig Bade of Victoria, Texas, arrived at the Infirmary on April 28, to observe the Ophthalmic Service as a Heed Fellow. Dr. Bade plans to remain here through the month of July.

The Harvard Medical School has announced postgraduate courses in Otology and Laryngology, to be held at Harvard and the Infirmary. Dr. LeRoy A. Schall, Dr. Werner Mueller, and Dr. Moses H. Lurie and associates will conduct these classes, to be offered from November 1, 1954 to March 26, 1955. Courses will include: Histopathology of the Ear, Nose, and Throat; Anatomy of the Head and Neck; Audiology; and Anatomy of the Temporal Bone.

The 58th Annual Meeting of the American Laryngological, Rhinological, and Otological Society, Incorporated, was held at the Hotel Statler, May 25-27. The three-day meetings consisted of speeches, table discussions, and question periods. Dr. Schall, as president of the Society, offered presidential remarks on the opening day. The Honorable Christian A. Herter, Governor of Massachusetts, extended greetings from the State, and Dr. Francis L. Weille addressed the Society on "An experimental study of the small blood vessels of the spiral ligament and stria vascularis of living guinea pigs during anaphylaxis".

VINCENT RESEARCH LABORATORY

In 1942, when the Vincent Memorial Hospital joined the Massachusetts General Hospital as the Gynecologic Service, there was no Vincent Laboratory. For that matter, there was no separate unit of the Hospital known as the Vincent; White 7 was used for Vincent patients. Very soon after the Vincent had joined forces with the Massachusetts General, Dr. Maurice Fremont-Smith was impressed by an article by Drs. Papanicolaou and Traut, published in the *American Journal of Obstetrics and Gynecology,* describing how it was possible to diagnose cancer of the uterus by examining the cells of a vaginal smear. It was not the fact that cancer could be diagnosed which intrigued Dr. Fremont-Smith, but rather the suggestion of the authors that cancer could be diagnosed before any symptoms had occurred. Here, perhaps, was a chance to diagnose one type of cancer earlier than had ever been done in the past. Dr. Meigs, the Chief of the then new Gynecologic Service, agreed that the problem certainly was worthy of investigation. The third member to join the group was Ruth Graham, who was to do the microscopic and technical work associated with it.

Thus, very early in the association of the Vincent and the Massachusetts General Hospitals, a specific laboratory problem arose. Space was needed and, since the anticipated Vincent Building could not be built for years, it was necessary to rely upon the generosity of the M.G.H. for space. Dr. Means kindly offered a corner of one of the thyroid laboratories which were then located on the 4th floor of the Bulfinch Building, and there a start was made in attempting to confirm Papanicolaou's findings.

During that first year, vaginal smears from 220 cases were examined. The laboratory was extremely fortunate in receiving smears, not only from the M.G.H. but from the Pondville Hospital as well, through the courtesy of Dr. Meigs and Dr. I. Kapnick. It soon became apparent that the method was worth while, since over 95% of the 62 cases with cancer of the uterus had been reported as positive by vaginal smear. This series of cases was reported in *Surgery, Gynecology, and Obstetrics* in 1943, and was the first paper to confirm Papanicolaou's earlier work.

Perhaps at this point it is pertinent to digress for a moment and discuss the basis for the cytologic diagnosis of cancer. Cells are shed from any epithelial surface. If, for example, a specimen of saliva is looked at microscopically it will show cells which have been shed from the lining of the mouth. Sputum contains cells which are discarded from the upper surfaces of the lining of the respiratory tract. Normal cells are continually falling off and they may be identified as normal, even though they are free single cells, just as the free cells in the blood can be identified. If a tumor is present, the cells from its surface will be shed just as are the normal cells, and if material is collected, fixed, and stained properly, these cells can be identified as cancer cells. The great advantage of this method is that a very small early tumor will desquamate cells, and by examination of single cells a diagnosis may be arrived at much earlier, in many instances. During a nine-year period, 57 cases of unsuspected uterine cancer have been discovered by the use of the vaginal smear, or 8% of our total cases. An unsuspected case is one where no symptoms are present and physical examination is considered negative by the gynecologist.

At first the cytologic diagnosis of cancer was confined to cancer of the female genital tract. However, as its value in that field became more firmly established, it was a natural course of events that it be applied to other types of cancer. The variety of specimens examined in the laboratory at the present time would have been unbelievable ten years ago. In an ordinary day, specimens of sputum, gastric secretion, nasal aspiration, rectal washings, pleural and abdominal fluids, and vaginal smears may all be examined. The field of cytology has expanded rapidly to include almost every type of specimen.

With such an expansion of material, it is obvious that expansion in space had to be found. The Vincent Laboratory has occupied many different places in the Hospital. The first separate laboratory was in the basement of the Bulfinch Building, near the Photography Laboratory. Soon, this became too small and the laboratory was moved to the House Staff Laboratory on White 9. There it remained until the new Vincent Building was complete in 1947. It appeared then that the space problem had been settled, but not for long. In 1953 the laboratory had an addition built, through the generosity of the Hyams Trust Fund.

The accuracy of the cytologic diagnosis will vary with the type of specimen examined, and below are listed the various types of fluids and the comparative accuracy as of 1953:

Specimen	Cancer cases	%Cancer cases diagnosed	%Positive reports confirmed
Vaginal smear	72	95%	95%
Sputum	77	71%	100%
Urine	17	65%	92%
Gastric	23	70%	94%

The reports from the Vincent Laboratory fall into four categories: negative, doubtful, positive, and unsatisfactory. A negative report means that all cells seen were considered benign; a positive report, that the cells seen were considered to be malignant; an unsatisfactory report means merely that not enough cells were present, or that those present were too poorly preserved to allow any diagnosis. These three types of reports are fairly clear, but there seems occasionally to have been some difficulty in the interpretation of the "doubtful" reports. The doubtful report does not mean that cancer cells are present. It means exactly what it says — cells are present about which the laboratory is in doubt, and more material is required before any definite decision can be made.

The accuracy of the method varies for a number of reasons — such as anatomical location of the tumor, as in cancer of the prostate and digestion of cells in an acid-gastric medium. Although the examination of all specimens does not equal the accuracy of the vaginal smear, in any fluid examined the positive reports are over 90% accurate. Such specificity as this makes the cytologic method valuable in the diagnosis of cancer.

From our interest in improving the accuracy of the vaginal smear came our first research project. Vaginal smears have always been done on all patients seen in the Gynecologic Tumor Clinic. A great many of these patients had been treated by radiation. We often found it difficult to distinguish between a normal cell showing radiation effect and cancer cells. In an attempt to resolve this problem, the vaginal smears of patients were studied throughout their radiation treatment. We found that not all patients showed the same amount of radiation effect in their cells, even though they may have received similar amounts of radiation. The amount of radiation response in the cells of the vaginal smear has become useful as a prognostic guide in cancer of the cervix treated by radiation. If there is little change in normal cells — and "little" is less than 65% normal cells showing radiation — the case is called a poor response to radiation. If the cellular response is greater than 75%, the case is considered a good response to radiation. In 140 cases of cancer of the cervix followed for 5 years, 66% of the good response group survived, and only 8% of the poor response group.

Since the normal cells appeared to be of such importance in the "cure" of patients treated by radiation, our next step was to attempt to change the poor response to a good response.

Before this could be done in patients, it was necessary to test various compounds in mice to find those which would make the animals more susceptible to radiation. After testing nearly 2,000 mice with a variety of compounds, testosterone propionate and alpha tocopherol were found to be the most effective in making mice more sensitive to radiation.

Then we were able to try these compounds on patients with poor cytologic response. Of the 7 patients considered poor responses and given additional medication, 6 were changed to good responses, as judged by their vaginal smears, and 3 of these patients are alive and well after two and a half years.

In the winter of 1952-53, one hundred cases were studied in this manner at the Radiumhemmet in Stockholm, Sweden. Vaginal smears were examined, and if the patient had a spontaneous good response, no additional medication was given. If, however, she had a poor cytologic response after the first radium application, either testosterone propionate or alpha tocopherol was given. It was possible to change 86% of the poor responses to good responses cytologically. Only time will tell if this will result in a higher survival rate.

The research of the laboratory at the present time is directed toward two main interests. The first is an attempt to clarify tumor-host relationships. Desoxynucleoprotein is being extracted from human tumors. It is then used as an antigen to test that patient's serum for antibodies against the tumor. Preliminary studies indicate that a few patients do react to their tumors by producing specific antibodies.

The second main research interest is that of why radiation helps people who have cancer. Patients receiving radiation are carefully studied. In addition, a fair amount of animal work is being conducted, both in rabbits and in tumor mice.

Other investigations are being developed in the laboratory, but this brief résumé applies only to the work being done on cancer. Dr. Janet McArthur and Dr. Frank Ingersoll are conducting experiments on the luteinizing hormone, which deserve a separate report.

No discussion of the Vincent Laboratory would be complete without some reference to our students. Since this laboratory was one of the pioneers in the cytologic diagnosis of cancer, it has always had numbers of students learning the technique. Last summer alone, there were students here from Sweden, the Philippines, France, Guatemala, Virginia, and Maryland. We have been particularly pleased to have so many foreign students.

The Vincent Laboratory's main interest in research is a clinical one. Its close association with the Gynecologic Service has made such research both feasible and profitable. This is due in no small part to the encouragement and direction the laboratory has always received from Dr. Joe V. Meigs, the Chief of the Gynecologic Service.

Ruth M. Graham, B.S.,
Director, Vincent Cytology Laboratory
John B. Graham, M.D.,
Director, Vincent Research Laboratory

ALLERGY LABORATORY NOTES

On April 7, Mr. Samuel R. Gargano spoke before the 67th Annual Session of the American Association of Anatomists at the University of Texas, in Galveston. He showed a motion picture entitled "A cinematographic record of microscopical observations of the small blood vessels of the spiral ligament and stria vascularis of living guinea pigs". Mr. Gargano is a third year medical student at Tufts. During summer vacations he developed a method of fenestrating the turns of the cochlea of living guinea pigs while working in the Allergy Laboratory.

Dr. Walter S. Burrage was chairman of the April 8 morning session of the 1st Conference on Microcirculatory Physiology and Pathology, held at the University of Texas, April 8-9. This meeting was held in conjunction with the 67th Annual Session of the American Association of Anatomists.

Dr. John W. Irwin was a member of the committee of the 1st Conference on Microcirculatory Physiology and Pathology.

Dr. Henry S. Forbes spoke at the Conference on Microcirculatory Physiology and Pathology. His subject was "Study of blood vessels on the cortex of living mammalian brain".

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it. We are very grateful that, this month, every title submitted included the classification.

Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Cardiology

Schaaf, R. S., with editorial assistance of Bland, E. F.
Cardiovascular diseases: A review of some significant publications (July 1949-June 1952).
A.M.A. Arch. Int. Med. 93:254-298; 407-463.

General Medicine

Benedict, E. B., and Gillespie, J. E. O'N.
Medical progress: Esophageal stenosis caused by peptic esophagitis or ulceration.
New England J. Med. 250:642-651.

Benedict, E. B., and Gillespie, J. E. O'N.
Peptic stenosis of the esophagus.
Surg., Gynec. & Obst. 98:494-502.

Histology

Odland, G. F.
Skin and the epidermal derivatives.
In Histology, R. O. Greep, Editor, New York, The Blackiston Company, pp. 428-457.

Laboratory Science

Griesemer, R. D., and Gould, E.
A method for the study of the intermediary carbohydrate metabolism of epidermis. I. Oxidation of acids of the citric acid cycle.
J. Invest. Dermat. 22:299-315.

Jeanloz, R. W.
4, 6-di-*O*-methyl-D-glucosamine hydrochloride (2-amino-2-deoxy-4, 6-di-*O*-methyl-D-glucose hydrochloride).
J. Am. Chem. Soc. 76:555-558.

Jeanloz, R. W.
6-*O*-methyl-D-glucosamine hydrochloride (2-amino-2-deoxy-6-*O*-methyl-D-glucose hydrochloride).
J. Am. Chem. Soc. 76:558-560.

Stoffyn, P. J., and Jeanloz, R. W.
3-*O*-methyl-D-galactosamine hydrochloride (2-amino-2-deoxy-3-*O*-methyl-D-galactose hydrochloride).
J. Am. Chem. Soc. 76:561-562.

Stoffyn, P. J., and Jeanloz, R. W.
4, 6-di-*O*-methyl-D-galactosamine hydrochloride (2-amino-2-deoxy-4, 6-di-*O*-methyl-D-galactose hydrochloride).
J. Am. Chem. Soc. 76:563-564.

Neurology, Neurosurgery, and Psychiatry

Benda, C. E.
The Dandy-Walker syndrome or the so-called atresia of the foramen Magendie.
J. Neuropath. & Exper. Neurol. 13:14-29.

Ophthalmology

Allen, H. F., and Mangiaracine, A. B.
Sterilization of sharp instruments for use in eye surgery.
A.M.A. Arch. Ophth. 51:311-314.

Otolaryngology

Kelemen, G.
Maxillary empyema and obesity.
Pract. oto-rhino-laryng. 16:91-95.

Surgery - Research

Nardi, G. L., McDermott, W. V., Jr., and Dobson, E.
The effect of portal caval shunts on liver blood flow as measured by radioactive colloid.
In Surgical forum 1953, Philadelphia, W. B. Saunders Company, pp. 376-380.

Books

Lever, W. F.
Histopathology of the skin, edition 2.
Philadelphia, J. B. Lippincott.

Brief bits: —

Dr. Edward B. Benedict recently attended the meeting in Montreal of the American Association for Thoracic Surgery and discussed "The conservative and surgical management of benign strictures of the esophagus", by Paul H. Holinger, Kenneth C. Johnston, Willis J. Potts, and Fernando DaCunha, and "Palliation of esophageal obstruction due to carcinoma with a permanent intra-luminal tube", by S. Mackler and Roland Mayer.

Dr. Walter S. Burrage was a guest speaker at the Annual Meeting of the Rhode Island Medical Society in Providence, on May 5. His subject was "Cortisone and hydrocortisone in the treatment of allergic disease".

Dr. Bradford Cannon recently attended the meeting in Galveston, Texas, of the American Board of Plastic Surgery, of which he is secretary-treasurer.

Dr. Benjamin Castleman addressed the Tri-State Spring Clinical Meeting of the Academies of General Practice of Maine, New Hampshire, and Vermont, which was held in Manchester, New Hampshire, on April 14. The subject was "Carcinoma in situ".

Dr. Edwin F. Cave spoke at the American College of Surgeons Sectional Meeting at Montreal in March on "Fractures and dislocations of the carpal bones". On May 17 he spoke in London at the combined meeting of the American College of Surgeons and the Royal College of Surgeons on "The present status of metallic internal fixation of long bone fractures in the United States".

At the recent meeting of the American Association for Thoracic Surgery held in Montreal, May 2-5, the Surgical Department of Massachusetts General was represented by the following people: Drs. J. Gordon Scannell, William R. Waddell, Hermes C. Grillo, E. Stanley Crawford, Paul S. Russell, Jr., and Edward B. Benedict. Two of our members of the Association presented papers: Dr. Scannell — "Surgical reconstruction of the superior vena cava" — co-author, Dr. Robert S. Shaw; Dr. Waddell — "The etiology of chronic interstitial pneumonitis associated with lipid deposition: An experimental study" —co-authors, Drs. Ronald C. Sniffen and Lawrence L. Whytehead.

VOLUNTEER GROUPS

MGH STAFF WIVES HOSPITAL COMMITTEE

The following officers for the year 1954-55 were elected at the May 5 meeting of the Committee:

Chairman—Mrs. Oliver Cope
Vice-Chairman—Mrs. Howard Ulfelder
Secretary to the Board—Mrs. Grant V. Rodkey
Corresponding and Recording Secretary—Mrs. E. Peirson Richardson, Jr.
Treasurer—Mrs. Charles L. Short
Hospitality—Mrs. Raymond D. Adams
Hospital Interests, Special Projects—Mrs. Richard H. Sweet
Volunteers—Mrs. Charles B. Burbank
Publicity—Mrs. John W. Raker

* * *

A unique observance of National Hospital Day, May 12, was made at the Massachusetts General Hospital. Invitations had been extended to friends of the Hospital to observe a typical and interesting Medical-Social Service Conference in the Moseley Rotunda at 2.30. Dr. Walter Bauer, Chief of our Medical Services, was the leader of the Conference. Other participants were members of the medical, nursing, and social service staffs. They demonstrated how all the services and resources of the Massachusetts General are brought together to provide the best possible care for a patient while he is in the Hospital and, also, to plan with appropriate community agencies to provide for his convalescence and rehabilitation as it affects him and his family.

Our Coordinating Committee, made up of representatives of the several volunteer women's groups in the Hospital, arranged the program, which included refreshments and optional tours for the guests. The members of the committee in charge of the National Hospital Day program were: Mrs. Augustus Thorndike, Chairman, Miss Josephine C. Barbour, Mrs. Edward D. Churchill, Mrs. Erwin N. Griswold, Mrs. Reginald Jenney, Mrs. Thomas H. Lanman, Miss Mary Quinlan, Miss Jessie Stewart, and Mrs. William R. Waddell.

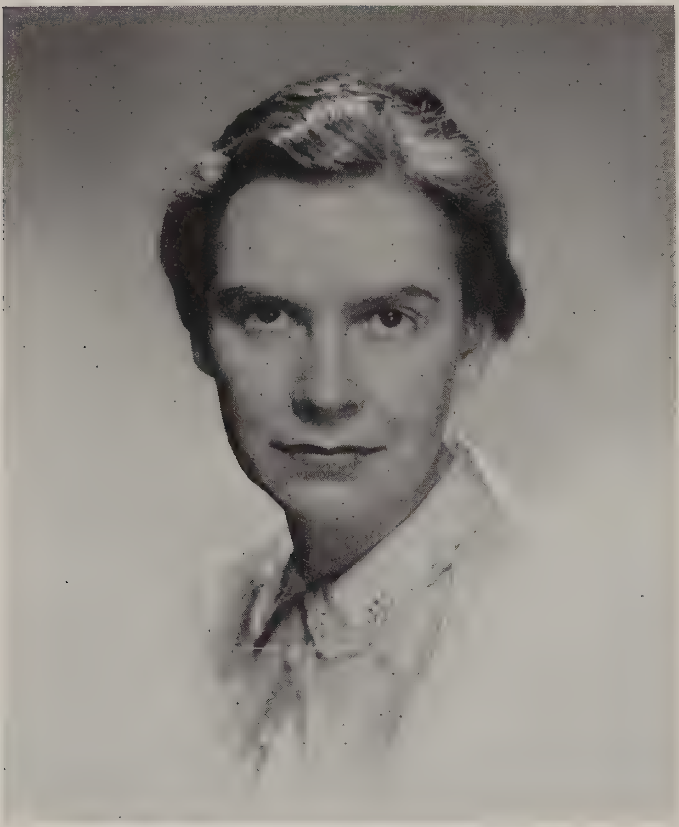
WORK SIMPLIFICATION

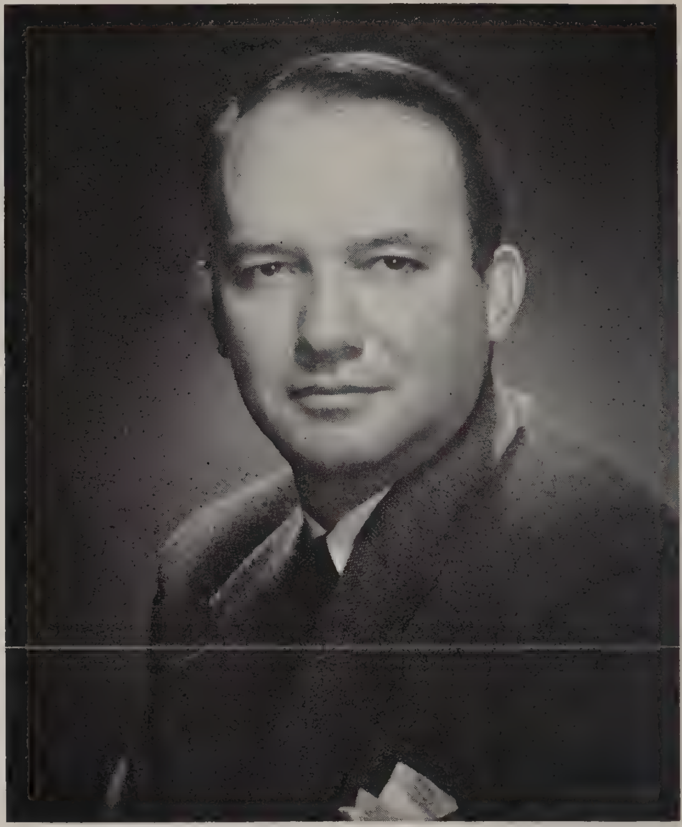
A new feature in administration has been inaugurated at Massachusetts General Hospital as a result of a course which Mr. Mattos and Mr. Murphy, two of our assistant directors, took at Lake Placid last summer. Mr. Mattos is conducting one phase of the program, with a series of conferences. Groups, kept to an ideally workable size by limiting the number of participants, are already meeting under Mr. Mattos's direction. Mr. Murphy will work jointly with department heads and the line organization in general, in the solution of technical problems as they may occur during the installation of new methods in connection with the program.

Mr. Mattos has given us this outline of the plan:

Work Simplification is the organized use of common sense aimed at finding easier and better ways of doing work on the part of everyone concerned. Work Simplification, or methods improvement, is an approach to better management and



NO. 48 IN A SERIES OF STAFF PHOTOGRAPHS
RUTH M. GRAHAM, B.S. — CLINICAL CYTOLOGIST



NO. 49 IN A SERIES OF STAFF PHOTOGRAPHS
JOHN B. GRAHAM, M.D. — ASSISTANT IN SURGERY

is of concern to top management as well as to the individual worker. The responsibility for creating or developing ideas which make for more effective service is shifted from top management (the efficiency expert, the industrial engineer) to the worker who, in the last analysis, knows his job better than anyone else. Top management, in the light of this change in thinking, must provide an atmosphere conducive to creativeness, and it must guarantee security to the worker whose objective is to eliminate waste—the elimination of which might ultimately mean the loss of his job if that should be in the interest of the organization. Obviously, management cannot guarantee any worker his job, but it must guarantee him employment if the objective of Work Simplification (to render service at the right time at a price the public can afford—an objective common to both management and worker) is to be attained.

Work Simplification is not a new idea. Frank and Lillian Gilbreth and Frederick W. Taylor, early exponents of time and motion in connection with work in various factories, developed the idea in the early 1900's as part of the scientific management movement. However, the approach or change of emphasis in Work Simplification from top management to the worker *is* new. It is new in that the human problem in applying any change is dealt with first, before the technical aspects of job improvement are tackled. We accept the fact that people resist change and resent criticism. We know that people prefer to be told they are right. In the light of this behavior which is accepted as natural in all of us, isn't it, then, common sense to emphasize the human relations aspect of methods improvement over and above the tools and technique of industrial engineering? To be sure, the latter are important, but only after the question of employment security has been settled in the worker's mind.

We must present the program to the worker in the light of these and other attitudes that are part of human nature. It is not deemed practical to present the program on the basis of time and motion studies and time clocks. Rather, it is offered on the basis of "working smarter and not harder". The average worker is not *primarily* interested in what management is going to get out of such a program, but rather in terms of what he is going to gain personally, or what he is going to avoid losing, by accepting Work Simplification. We can deal more effectively with the human problem and, indeed, do a better job of methods improvement if we keep in mind that many people do things for two reasons only: because they desire 1) to gain something, 2) to avoid losing something.

Work Simplification is ultimately not only a new approach to top management but also to personnel management. It appears as a two-pronged attack, as it were, upon the solution of our production problems, whether the production involves goods or service, as well as the solution of some of our more tenacious morale or human relations problems.

Here at M.G.H. a group of twenty dietitians has already taken the first Work Simplification sessions to be offered. Currently, three new groups have begun the series. The sessions are being offered first to those in managerial posts (department heads, supervisors, foremen, etc.), then to the operators or workers. This particular approach is not only desirable but essential. We are told that we all have a natural desire to improve our effectiveness if we are uninhibited. We must remove the inhibiting circumstances in terms of attitudes. In other words, we must open minds, instill the attitude of inquiry, and arouse the desire for the better way. Before we can open the minds of workers, before we can stimulate them out of complacency, we must condition management's own attitude toward this new philosophy.

* * *

A sure way to inflict an unbearable case of nostalgia upon all MGH-ers who are now living at a distance from the Hospital is to tell you that the sturdy old chestnut tree in the Bulfinch yard is again in resplendent full-bloom as we send this issue off to press.

THE NEWS

No. 136 Boston, Mass. July and August 1954

PSYCHIATRY SERVICE

On July first Dr. Erich Lindemann takes over the Psychiatry Service of the Massachusetts General Hospital, as Chief of Service, and becomes Professor of Psychiatry at the Harvard Medical School. By training he is both a psychologist and psychiatrist, having taken his Ph.D. in psychology at the Universities of Marburg and Giessen in 1922, and his medical degree at the Universities of Cologne and Giessen in 1926. He is versed in the theories and techniques in both fields. In recent years he has held important teaching positions in the Department of Social Relations at Harvard University and in the Harvard School of Public Health. His varied activities in psychiatry attest to the breadth of his interests and his versatility. Before coming to Harvard in 1935 he was actively engaged in the diagnosis and management of psychotic patients at the Medical School of the University of Iowa. It was during this period that he discovered the effect of sodium amytal on the mental functions of the depressed and schizophrenic patient; the now widespread use of barbiturates in the technique known as narcosynthesis stems from this research work. At this time he carried on several studies of the psychological effects of other pharmacological agents. For many years, at the Massachusetts General Hospital, Dr. Lindemann was in charge of the Psychiatric Out-Patient Department and also supervised the consultation services. His pioneering studies of patients with ulcerative colitis and his observations on the somatic effects of grief were conducted at this time. He also published papers on the emotional reactions following hysterectomy and on hysteria and other neuroses. In recent years Dr. Lindemann has turned his attention to the sociological aspects of psychiatry. The Human Relations Service of Wellesley, Incorporated, which he organized and administered, is now well known as a highly original approach to the understanding of mental disease in an American community.

Dr. Lindemann comes to us at a time when psychology, sociology, and medicine are beginning to cooperate in important investigations. The well substantiated sciences in the Medical School will continue to be basic, but the behavioral sciences are bringing new techniques to the physician. It can hardly be doubted that in the next decades these will improve not only the treatment of the individual patient, but the relation of the general hospital to the community in which it functions. We welcome Dr. Lindemann with enthusiasm!

At this point the retiring Chief may be pardoned for taking a look backward over the twenty years of his incumbency. Our Psychiatry Service was one of the first psychiatry units in a general hospital. The idea was initiated by Dr. Means and supported by the Rockefeller Foundation as a demonstration. Since then, many such units have been founded, some directly affected by our experience. Thus we have aided in an important trend in modern psychiatry — to get it out of the isolated, special hospital and integrate it with general medicine.

The task was to bring psychiatry to a great general hospital and make the physicians and surgeons of the staff realize that psychiatric problems occur in almost all patients with chronic, and many with acute, illness. Psychiatry is not confined to crazy people; far from it; we now regularly get consultations and patients to treat from every service in the Hospital. A great many of the staff members in departments other than psychiatry are truly interested in our work and cooperate to a most gratifying degree. They realize that much of psychiatry is the understanding of human motivation, and that such knowledge is of benefit to practically all people who suffer illness. Our recent studies on the psychiatric aspects of patients with cancer, low-back pain, and coronary disease are examples that show to what extent we have succeeded.

Another aspect of our work has been more controversial. We have tried to make psychiatry dynamic in every way:

(1) By supporting and teaching a psychology of personality based on considering each patient as a person with goals, motives, and strivings. These in turn are conditioned by his particular genic, developmental, and historical past. Many of the postulates upon which such a psychology is based originated with Freud, but others came from Meyer, Thorndike, Pavlov, and many contemporary psychiatrists. This point of view is eclectic, and is criticized both by the orthodox Freudian and by the anti-Freudian. Nevertheless, we have pursued it with some measure of equanimity and therapeutic success.

(2) By developing and teaching a theory of mind. This holds that mind is a function of the living brain in action. Therefore it is important for psychologists and psychiatrists to know as much as possible about the anatomy and physiology of the brain. This point of view has brought us into close and fruitful collaboration with the neurosurgeons and neurologists, and has led to some interesting research concerning pain, consciousness, and leucotomy.

(3) By supporting the thesis that all function is organic, i.e., no cell or tissue can perform its function without physical and chemical change. Having rid ourselves of the anachronistic dichotomy, "either functional or organic", we can see that not only do lesions produce symptoms (observable dysfunction), but prolonged dysfunction produces lesions (visible tissue changes). This is the basis of "psychosomatic medicine" — that ancient attitude toward medicine which has had a revivication in the last twenty years, and is basically nothing but comprehensive medicine. We have published many papers in this field, and three books; some opinions have been speculative and controversy has been aroused, but on the whole our constructive effort has been to show how emotions affect physiology and what the processes are that cause pathological changes.

(4) By studying lesions of the brain and their effect on personality. Some of the relationships of neuropathology to psychiatry are so obvious that they need no emphasis; others are more tenuous; but we believe that the brain is the organ of the mind and that an understanding of human behavior is impossible without neurology. For example, our series of papers on language show that certain cerebral lesions, formerly thought to be without psychological effect, do significantly change the patient's patterns of speech behavior. The lesions interrupt certain pathways and apparently change the dynamic possibilities of the neuronal patterns.

I believe our Service has been useful in the last twenty years. Many patients have been helped. We have given training to fifty residents and at least as many fellows who have gone far and wide to practise and teach. Our investigations have made contributions here and there. Perhaps they have added a few stones to the growing mosaic which will eventually give a picture of mental disease. To my successor I leave the development of a bigger and better Psychiatry Service. For several years it has been evident that Ward B 8 (our small disturbed ward) needed to be greatly enlarged to serve the needs of the Hospital. I believe there should be another ward where disturbed and severely ill psychiatric patients can be investigated and treated with the aid of all the staff and facilities of this great general hospital. Child Psychiatry should be given a permanent place in our system of treatment, training, and research. Its importance to the understanding of adult psychiatry is rapidly becoming recognized. It will not be long before experience in child psychiatry is considered essential to the training of all psychiatrists. Ward B 7 and the Out-Patient Psychiatry Clinic are functioning and developing satisfactorily, but with new leadership will doubtless expand in new directions.

I cannot close without expressing my thanks to my interns, residents, and colleagues on the staff, and my deep appreciation of their loyalty and help. From my intimate work with all these men and women I have gained immensely. They helped me to make diagnoses, to carry responsibility, to think critically, and to stay young in interest. To work in a small unit in a great institution seems to me the ideal professional life. This opportunity the Massachusetts General Hospital has given me in full.

Stanley Cobb, M.D.,
Retiring Chief of Psychiatry Service

The Board of Trustees, at their meetings on May 14 and 28, voted:

To accept with regret the resignation of Dr. Leon R. Lezer from the position of Assistant Director, effective July 31;

To promote Dr. Chester M. Jones to the position of Consulting Visiting Physician, effective July 1;

To extend the appointment of Dr. William N. Jones, Assistant Resident in Orthopedic Surgery, through December 31;

To grant leave of absence to Dr. Raymond D. Adams for the months of August, September, and October.

To appoint:

Dr. Irving P. Ackerman as Resident in Medicine, effective January 1, 1955;

Dr. Stanley Cobb to the Board of Consultation upon his retirement, June 30;

Dr. Philip S. Gordon as Dental Intern, as of July 1;

Dr. Charles S. Kubik to the Board of Consultation;

Dr. Wyland F. Leadbetter as Chief of the Urological Service, effective September 1;

Dr. Erich Lindemann as Chief of Psychiatry at the Hospital, effective July 1;

Dr. Malcolm K. Sykes as Fellow in Anesthesia, effective October 1;

Dr. Norman Trieger as Dental Intern, as of July 1;

Dr. Mark McN. Walter, Jr. as Assistant Resident in Psychiatry for one year, beginning July 1.

At their meetings during May, the General Executive Committee voted:

To accept the resignation of Irving Wolf, Ph.D. as Research Fellow in Psychiatry, effective June 1;

To extend the appointment of Dr. Warren B. Weil as Clinical Fellow in Medicine, for a period of two months, ending June 30;

That the title of Dr. Norman L. Paul be changed from Clinical Assistant in Neurology to that of Clinical Fellow in Neurology, effective as of July 1;

To rescind the appointment of Dr. André Tetu as Clinical Fellow in Medicine, beginning July 1.

To reappoint:

Dr. George Eisenman as Research Fellow in Anesthesia for one year, beginning June 1;

Dr. Betsy A. Ledbetter as Assistant Resident in Anesthesia for one year, beginning July 15;

Dr. John F. McGinty as Clinical Fellow in Medicine, assigned to Cardiology, effective May 27;

Dr. Donald O. Rudin as Research Fellow in Anesthesia for one year, beginning July 1.

To appoint:

Lt. Col. Jesse F. Brown as Clinical Fellow in Anesthesia, for approximately forty-five days, beginning May 21, or as soon thereafter as he can report for duty;

Dr. John W. Donoghue as Clinical Fellow in Psychiatry for one year, beginning July 1;

Charles P. Gansser, Ph.D. as Research Fellow in Medicine, effective as of June 1;

Dr. Robert S. Grier as Clinical and Research Fellow in Medicine, effective as of May 17;

Dr. Cornelius Lansing as Clinical Fellow in Psychiatry, from September 1, 1954 through June 30, 1955;

Dr. Martin B. Levene as Clinical Assistant in the Department of Radiology for one year, beginning July 1;

Dr. Kurt F. Schmidt as Clinical Fellow in Anesthesia for one year, beginning June 4;

Dr. Arnold D. Schwartz as Clinical Fellow in Psychiatry, beginning July 1.

* * *

One of the high lights of the 173d Annual Meeting of the Massachusetts Medical Society on May 20 was the telecasting of Grand Rounds, carried by telephone lines over a closed circuit from the Ether Dome of the Massachusetts General Hospital to the Georgian Room of the Hotel Statler.

Dr. Richard Warren, chairman of the program committee for the Annual Meeting of the Society, conceived the idea and, with the assistance of Dr. Archie Abrams and Dr. H. Thomas Ballantine, Jr., explored the possibilities of presenting such a program. As a result, Wyeth, Incorporated, sponsored the televised program, which was produced by the Radio Corporation of America, under the direction of Mr. Walter Lawrence.

Dr. Benjamin Castleman was the chairman of the committee in charge of setting up the program here in the Hospital. The presentation included Medical Grand Rounds, Surgical Grand Rounds, and a Clinical Pathological Conference, exactly as they are held each week, except for the fact that it was necessary to hold the latter two in the Ether Dome instead of in their usual locations.

Three days before the presentation, cameras and equipment began to roll into the Ether Dome. The smooth installation that followed was nothing short of miraculous and was due in large measure to the cooperation given to the technical experts by the Hospital personnel.

The Grand Rounds were projected on a 12′ x 16′ screen in the Georgian Room at the Statler. The effect of the unusually large image, plus the clear intercommunication hookup between the Statler and the Ether Dome created the startling impression that the two audiences were together in the Ether Dome. It is noteworthy that the audience at the Statler numbered between four and five hundred — a record attendance for a morning session of an Annual Meeting of the Massachusetts Medical Society.

In addition to the audiences in the Ether Dome and at the Statler, people at the Hospital gathered in the Medical Staff Room, the East Cafeteria, and the Pharmacy, where television sets had been installed. This provided an opportunity for many of the personnel of the Hospital to "view" Grand Rounds for the first time.

During the three-hour program, it was necessary to break in with short intermissions, to allow people to leave and enter the Ether Dome as the different Rounds were introduced. There was, however, no break in the continuity of the program, for during these intermissions interesting remarks pertinent to the occasion were made by Dr. Frederick Hagler, President of the Massachusetts Medical Society, Dr. Dean A. Clark, General Director of the Hospital, Dr. Walter Bauer, Chief of our Medical Services, Dr. Edward D. Churchill, Chief of our Surgical Services, and Dr. George Farrar, Medical Director of Wyeth Laboratories.

When asked to comment on the value of this type of program as a teaching device, Dr. Clark said, "This medium may have important possibilities in certain types of exercises, particularly those where it is desirable to bring a large audience closer to the event than would be possible in a small amphitheatre."

* * *

Brief bits:—

Dr. Clemens E. Benda was made an Honorary Member of the Pediatric Society of Uruguay at its last general meeting, in recognition of his valuable contribution to pediatric research.

Dr. Edward B. Benedict attended the meetings of the American Broncho-Esophagological Association on May 25 and 26, at the Hotel Statler in Boston, and discussed the following papers: "Postoperative esophageal stenosis", by Drs. Daniel C. Baker, Jr., Charles A. Flood, and Jose M. Ferrer, Jr.; "A thirty-one-year hospital experience with the bronchoscopic approach to bronchial adenoma", by Dr. Lamar Soutter; and "Recent trends in management of esophageal strictures", by Dr. Claude C. Cody.

Dr. Bradford Cannon has been appointed Secretary of the Committee on Development of the Boston Medical Library. It is the purpose of this committee to investigate ways of increasing the support of the Library, whose function is so important to the professional and lay people of New England.

Dr. Fletcher H. Colby was elected President of the American Association of Genito-Urinary Surgeons, at a recent meeting of the Association held at Shawnee-on-Delaware.

Dr. James H. Currens attended the Minnesota State Medical Meeting, held in Duluth on June 7. He spoke on the use of protoveratrine in the treatment of hypertension, and participated in a panel discussion on the medical treatment of hypertension.

Dr. Harriet L. Hardy presented a scientific exhibit at the Fiftieth Anniversary Meeting of the National Tuberculosis Association in Atlantic City, May 17-21. This exhibit was entitled "Problems in the differential diagnosis of occupational lung disease", and was a demonstration of the work of the Occupational Medical Clinic at this Hospital.

Dr. Reed Harwood has been elected President of the New England Diabetes Association, and a member of the Board of Governors of the American Diabetes Association.

Dr. Grantley W. Taylor spoke on "Principles and problems of neck surgery" at a meeting of the American Laryngological Association, held at the Hotel Statler in Boston on May 28.

Dr. William R. Waddell presented a paper at the American Proctologic Society meeting, held in Los Angeles on June 5. His subject was "The treatment of malnutrition, with particular reference to the surgical patient". Co-authors of the paper were Drs. Robert P. Geyer, Hermes C. Grillo, and Frederick J. Stare.

Dr. Richard C. Webster and three associates announce the formation of the Webster Clinic for Plastic and Reconstructive Surgery, located at 1101 Beacon Street, Brookline, Massachusetts.

MASSACHUSETTS EYE & EAR INFIRMARY

Three members of the Infirmary's staff retired as of June 30, Mr. Henry Hixon Meyer, President of the Board of Managers, announced. Dr. Parker Heath, Director of the Pathology Laboratory, Dr. Merrill J. King and Dr. Benjamin Sachs, both Ophthalmic Surgeons, have left the active staff. At a meeting of the Board of Managers and the Corporation on May 5, it was voted to accept the resignations of Drs. Heath, King, and Sachs "with gratitude for their many services to the hospital". A dinner was held at the Harvard Club on June 4 in honor of these retiring staff members.

Dr. Francis J. West, Assistant in Ophthalmology, addressed a psychiatry seminar at Boston State Hospital on May 26. His subject was "What the psychiatrist needs to know about eye disorders". The seminar was under the auspices of the Postgraduate Institute.

The Infirmary was honored to have two distinguished guests during the month of June.

Dr. David E. S. Wishart, a 1922 graduate of the Infirmary's Aural and Laryngological Service, who was recently elected president of the American Otological, Rhinological, and Laryngological Society, visited and observed in the ENT Service for a few days.

Dr. Antonio Raul Bergara, Professor of Otolaryngology at the University of Buenos Aires, spent two weeks at the Infirmary, observing in the Department of Otolaryngology. During his stay here, Dr. Bergara lectured and showed slides to the staff on his method of radical operation of the frontal sinus.

The Infirmary has welcomed to its staff Dr. Samuel C. Doyle, who will receive resident training in Otolaryngology. Dr. Doyle was graduated from Dartmouth College with a Bachelor of Arts degree in 1948, studied for two years at Dartmouth Medical School, and was graduated with a Doctor of Medicine degree from the University of Pennsylvania in 1952. He served a rotating internship at the Mary Hitchcock Hospital in Hanover, New Hampshire, before receiving notice of his acceptance in the Infirmary's Otolaryngological Service.

A high top shelf in a long-undisturbed closet here at the Hospital recently revealed several articles whose ownership we have managed to determine. These articles have either been sent to their rightful owners or are waiting here in the office of The News to be picked up — with the exception of one item. It is a metal trophy in the shape of a cup, bearing the inscription "Baraca Bowling League, 1912-13 — First Team Prize".

If anyone can furnish us with information concerning this trophy we would be most grateful.

DIGESTIVE TRACT DISEASE

Organized study of digestive tract disease in this Hospital falls into two categories. The first concerns direct observation of in patients and those seen in the ambulatory clinic. The second concerns actual investigation of various physiological problems related to individual disease states.

Inasmuch as there is no strict separation of patients suffering from gastrointestinal, hepatic, or pancreatic diseases on a special service, routine problems, either on the wards or in the ambulatory clinic, are handled primarily by the members of the House Staff on the Medical and Surgical Services. The more important or difficult cases are given particular consideration by consultation with members of the group working directly under the supervision of Dr. Chester M. Jones. Thanks to the cooperation of the Medical and Surgical House Staff, members of this group have the opportunity to see and discuss the more important problems in this field by consultation with the ward staff and under the direct supervision of Dr. Myles Baker, Dr. Daniel Ellis, and Dr. Perry Culver.

In addition, ambulatory patients are seen, either as consultation cases or for the purpose of careful follow-up, in the Gastro-Intestinal Clinic, which meets every Tuesday afternoon throughout the year. This clinic is a combined medical and surgical clinic, of which the acting head at the present time is Dr. Ellis. In this clinic is followed a variety of disease conditions, including peptic ulcer, esophageal disease (with the aid of Dr. Edward Benedict), chronic enteritis, chronic ulcerative colitis and diverticulitis of the colon, various forms of subacute and chronic liver and biliary tract disease, and certain cases of pancreatic disease. In addition, postoperative cases involving neoplasia of the digestive tract are also seen. Inasmuch as both medical and surgical problems of diagnosis and management are present, there is close correlation of the efforts of the two major services in the Hospital, from the point of view of both the management of cases and of the preparation of long follow-up studies. A rather unique feature of the Gastro-Intestinal Clinic is the special meeting, held on the first Tuesday in each month, of a large group of patients with ileostomy after surgery on the large bowel. This group in particular is followed by Dr. Ellis and Dr. Richard Warren. The unusual aspect of this clinic group lies in the fact that problems arising after ileostomy are discussed before the entire group of patients, who, in fact, make very real contributions based on their own individual experiences.

Investigative work concerning physiological abnormalities related to the digestive tract is being carried out by a group of research and clinical fellows under the supervision of Dr. Jones and Dr. Culver. During the past few years the attention of this group has been primarily focused on the problems of absorption of food material from the intestinal tract. In the last year this work has been carried out by Dr. Stuart Ragland, Dr. Howard Spiro, Dr. Geoffrey Chandler of Leeds, England, and Dr. Jacques Gagnon of Montreal. These efforts include careful balance studies of the absorption of fat and proteins under control conditions on the metabolic ward, with particular relation to diseases such as sprue, Whipple's disease, and the steatorrheas following subtotal gastrectomy. Particular attention has been paid to the demonstration of the effects of corticosteroid therapy in sprue and allied conditions. Striking clinical improvement has been noted in all cases of sprue and in one case of Whipple's disease following appropriate treatment with corticosteroids, and clinical improvement has been matched by equally striking percental increases in food absorption.

As an important corollary to such observations, the "G.I. Group" has been attempting to develop and utilize procedures which will permit estimations of fundamental changes in cell work involved in the process of intestinal absorption. From sections of human and animal intestinal mucosa removed at operation, studies have been carried out, particularly by Dr. Ragland (with the aid and advice of Dr. Morris Soodak), in order to determine normal levels of phosphorylating activity and possibly dephosphorylation, as a means of clarifying what is commonly called food absorption across the intestinal membrane. These observations promise the possibility of studying at a very fundamental level alterations in food absorption as they are mediated by the intestinal cell under varying conditions, including the stimulus of corticosteroid therapy. It is becoming obvious that the chapter on food absorption must be largely rewritten, and the development of tools directed at searching out fundamental mechanisms is of the greatest importance.

In addition, Dr. Chandler and Dr. Gagnon are carrying out studies initiated a year ago by Dr. John Benson and Dr. Firmin Vansteenhuyse, in an attempt to determine the site of maximum absorption in animals of tagged lipids. It is of interest that repeated experiments have demonstrated what appears to be an area of maximum absorption in rats at or near the junction of the jejunum and ileum. Such a finding has obvious value in any consideration of necessary surgical operation on the small bowel. It is expected that similar studies will be undertaken in relation to other tagged substances, such as albumin, carbohydrates, and possibly vitamins.

Dr. Spiro is working particularly on various phases of gastric secretion, especially related to hydrochloric acid and pepsin and with especial reference to the level of pepsin in the blood. The latter may well provide a means of obtaining a very satisfactory estimate of gastric secretory activity. Further studies are projected on similar digestive enzymes secreted at a level below the pylorus.

Attempts to evaluate the nature of nutritional disturbances connected with subtotal gastrectomy and the fundamental basis of "dumping" symptoms are being continued. Studies on the effects of certain of the newer antispasmodic blocking agents on gastric and intestinal motility are also being continued by Dr. William Chapman, with the assistance of Dr. Gagnon. Finally, Dr. Gagnon, in cooperation with the Department of Radiology, is currently working with Dr. Martin Levene of that department in testing the diagnostic value of intravenous cholangiography and cholecystography by means of the new dye, Cholografin (Biligrafin).

In addition to the interests noted above, special mention should be made of Gastro-Intestinal Rounds, which are held every Wednesday morning for members of the Medical and Surgical Staff and for outside physicians. At these meetings, unusual or important problems arising in the diagnosis and management of diseases of the digestive tract are presented in detail by members of the "G.I. Group" and are discussed freely by Staff members of both Medical and Surgical Services and occasionally by those of the Children's Medical Service. Furthermore, x-ray interpretations are contributed by a representative of the Department of Radiology. These Rounds afford a very complete review of a large variety of conditions during the year and are of inestimable value in providing the clinical background for investigative work and for guidance in the treatment of disease conditions that are encountered throughout the Hospital. They also help to nourish and maintain a very healthy attitude of cooperation and friendly criticism between members of the various services in the Hospital.

A Research Meeting is held once a week by the group doing investigative work, and to these meetings are invited men from other hospitals who are interested in particular phases of the conditions under discussion. This arrangement has provided a very excellent source for free discussion of many of the clinical and technical difficulties arising in diseases of the alimentary tract and the added stimulus of an exchange of ideas with men working in other teaching and research units.

Chester M. Jones, M.D.,
Consulting Visiting Physician

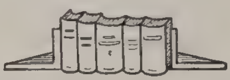
New addresses:—

Dr. Edward V. Johnston (*W.S.* 1947), Waterloo Savings Bank Bldg., Waterloo, Iowa
Dr. Charles L. Schepens (a. *Oph.*), 327 Charles St., Boston 14, Mass.
Dr. Edgar J. Schoen (a.r.p. *C.M.* 1954), Kaiser Foundation Hospital, Broadway and MacArthur Blvd., Oakland, Calif.
Dr. Milton V. Veldee (*E.M.* 1920), Stanford Research Institute, Stanford, Calif.



STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration — an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Eisenman, G., and Rudin, D. O.
Further studies on the functional properties of spinal axons in vivo.
J. Gen. Physiol. 37:495-503.

Lasagna, L.
A comparison of hypnotic agents.
J. Pharmacol. & Exper. Therap. 111:9-20.

Dermatology

LeDonne, J. E.
Mycosis fungoides: Report of a case terminating in myelogenous leukemia.
New England J. Med. 250:240-242.

Endocrinology

Munson, P. L., Goetz, F. C., Laidlaw, J. C., Harrison, J. H., and Thorn, G. W.
Effect of adrenocortical steroids on androgen excretion by adrenalectomized orchidectomized men.
J. Clin. Endocrinol. & Metab. 14:495-508.

General Medicine

Irwin, J. W., Henneman, P. H., Wang, D. M. K., and Burrage, W. S.
Maintenance cortisone in intractable asthma: Preliminary observations of undesirable cortisone effects.
J. Allergy 25:201-209.

General Surgery

Waddell, W. R., Geyer, R. P., Clarke, E., and Stare, F. J.
Function of the reticuloendothelial system in removal of emulsified fat from blood.
Am. J. Physiol. 177:90-94.

Laboratory Science

Bacq, Z. M., Baddiley, J., Eldjarn, L., Lipmann, F., and Lynen, F.
Nomenclature of the amines derived by decarboxylation of cysteine and cystine.
Science 119:163-164.

Brodie, A. F., and Lipmann, F.
The enzymatic formation and hydrolysis of D-gluconolactone.
Bact. Proc., 1954, 107-108.

Graham, R. M., and Rheault, M. H.
Characteristic cellular changes in epithelial cells in pernicious anemia.
J. Lab. & Clin. Med. 43:235-245.

Hoagland, M. B., and Novelli, G. D.
Biosynthesis of coenzyme A from phosphopantetheine and of pantetheine from pantothenate.
J. Biol. Chem. 207:767-773.

Levintow, L., and Novelli, G. D.
The synthesis of coenzyme A from pantetheine: Preparation and properties of pantetheine kinase.
J. Biol. Chem. 207:761-765.

Lipmann, F.
On the mechanism of some ATP-linked reactions and certain aspects of protein synthesis.
In The mechanism of enzyme action, William D. McElroy and Bentley Glass, Editors, Baltimore, The Johns Hopkins Press, pp. 599-604.

Novelli, G. D., Schmetz, F. J., Jr., and Kaplan, N. O.
Enzymatic degradation and resynthesis of coenzyme A.
J. Biol. Chem. 206:533-545.

Occupational Medicine

Hardy, H. L., Elkins, H. B., Ruotolo, B. P. W., Quinby, J., and Baker, W. H.
The use of monocalcium disodium ethylene diamine tetra-acetate in lead poisoning.
J.A.M.A. 154:1171-1175.

Miscellaneous

Garland, J.
The function of a general medical journal.
World Med. J. 1:151-153.

Books

Garland, J.
All creatures here below.
Boston, Houghton Mifflin Company.

BIOGLET

Dr. Edwin W. Salzman, Assistant Resident in Surgery—born in St. Louis, Missouri, December 11, 1928; A.B., Washington University, St. Louis, 1950; M.D., Washington University School of Medicine, 1953; home: Springfield, Illinois.

In January 1951, a number of men on the House Staff were beginning to be just a bit restless. Sig Gundersen was already in Japan, several others had just been called, and a few more of us were expecting to be heading toward the Far East at almost any time. The Marines had been surrounded at the Chosen Reservoir and had fought their way out. Hungnam had been evacuated. The headlines were filled with reports of frozen feet in Korea and a frozen woman in Chicago. Berlin was being supplied by air. When Bob Shaw cornered me one morning in the E W (where I was unraveling some G U problem) and asked if I'd like to take a trip to the Far North for a month, I pounced upon the opportunity.

The air base which has been built in Thule, Greenland, has been well publicized by now, but at that time it was only "Project Blue Jay" — still on the planning board and shrouded with secrecy. A small preliminary survey party was to go up to look over the area, and a doctor was needed to go with them. The work would be done in a month and I would be home, I expected, just in time to receive Navy orders. I stayed for five months instead of one, however, and instead of some 20 men I had planned to look after, there were about 1600 by the time reinforcements had arrived. It turned out to be a far more fascinating (and much more lucrative) venture than I'd anticipated.

We actually got under way in the middle of March. Eighteen men from the North Atlantic Constructors, the Army Area Engineer from the Corps of Engineers, and I met at Westover Field. A survey party of 16 was to follow shortly. On the evening of March 17 we took off on the first flight of an airlift which was eventually to rival in many respects the one in Berlin. It was an unseasonable 60 degrees in Chicopee Falls the night we left, but we had no trouble cooling off at 10 below zero the next morning when we landed for fuel and breakfast at Frobisher Bay on Baffin Island. After a pleasant respite at this halfway point, we took off again on our last leg of the flight.

When we came over Thule we found it to be very difficult to spot. When we looked down, all we could see was a wide barren expanse of white frozen ocean and a wide barren expanse of white frozen ground. The few snow-covered shacks of the Weather Station were scarcely visible. Occasional rocky cliffs projected from the coast line, but there were no trees or other growth to add variety to the monotonous landscape.

When we settled on the ground we were rather surprised to find three quite separate and distinct communities. About two miles from the spot where we landed, across the North Star Bay, was the Danish village of Thule. Mr. Krogh, the Manager of Northern Greenland for the Danish Government, resided here. Here, also, were a Danish radio station and a small hospital run by Laege Hack Busch, who later became one of my good friends. The Danish population of Thule was about 30. Near by was the Eskimo (more properly, North Greenlander) village, with a variable, somewhat nomadic population ranging up to 100. At a site near our landing spot was the joint Danish-U.S. Weather Station, where from 4 to 6 Americans lived, including one American wife. This area was called by the natives "Petugfik" — the "place of the dead dogs". Here, in bygone days, the Eskimos' rather considerate dogs used to wander off to die. Many a "Blue Jay" man was disappointed to find that bones he suspected to be of some archeological import belonged to a former North Greenland work horse. Visions of some prehistoric mastodon were frequently inspired by a few old whale's bones which had been disposed of in Petugfik after the digestible (?) material had been removed by earlier North Greenlanders.

The Eskimos in this area might be considered among the few remaining northern peoples who have not as yet been largely absorbed by Western Civilization. Livelihood is still almost entirely dependent upon ability to hunt and fish, and the acknowledged leader of any community is always the best hunter. A few dietary tidbits may be obtained at the local Danish trading post, but this is purposely limited by the Danish Government to avoid indiscretions and illness which a "civilized" diet might encourage. There has been ample evidence, especially in Alaska and Northern Canada, that a partial change of diet to our foods is detrimental to Eskimo health and welfare. Therefore, North Greenlanders subsist almost entirely on what they can catch — seals, fish, birds, whales, etc. In front of their huts you'll find high racks on which a seal or walrus can be safely stored out of reach of the dogs. Along with them will usually be found a few delicacies, such as washed and dried (but not cooked) seal intestine, which, in addition to being unusually tasty, provides most of their vitamin C intake. In the summer, when temperatures are above freezing, you'll find a few small Arctic terns seasoning on the racks. When these small birds have rotted sufficiently, they become a North Greenland gourmet's delight. "Candy" for these people consists of "matak" — a bit of thick, gristly skin of a whale, which, when chewed, has a sort of nutty flavor and is not really bad at all.

From an epidemiological point of view, the Eskimos in their isolated state are quite interesting. Their chief scourge is tuberculosis, which they think (perhaps rightly so) was introduced by the white man long ago. It was quite definitely present in Greenland before colonization by Europeans in the early 1700's, but there had been many prior sailing expeditions to the island during the 16th and 17th centuries and earlier, when the organism may have been donated to the inhabitants. Regardless of its origin, it has thus far been almost impossible to deal successfully with the tuberculosis problem. If and when the disease is found, the victim may be packed off into one of the hospitals scattered round the island; but, after three or four weeks, he becomes much too homesick and, if he is physically able, he walks out of the hospital and back to his 6′ x 8′ family home, where he may share his disease freely with relatives and friends. It is really quite surprising that tuberculosis is not far more widespread than it is, although a conservative estimate indicates that from 10% to 20% of the population have the disease. Ingestion of the organisms makes extrapulmonary tuberculosis common.

Ordinary communicable diseases among the Eskimos usually present no problem. Complete isolation means complete freedom from colds and other infectious diseases. On the other hand, when organisms like pertussis, rubeola, influenza, and such are brought in by visitors from the outside world, the results are frequently devastating. Smallpox has wiped out several entire communities. Whooping cough may carry a mortality rate reaching as high as 40%; and measles, mumps, and chickenpox each exacts its death toll. There was a wide epidemic of upper respiratory infections among the Thule Eskimos while we were there, but our only real scare — when an infant developed a pneumococcal pneumonia — failed to materialize. Our general good luck was doubtless due, in part, to the fact that the local Eskimo and Danish villages were strictly off limits to all but a very few.

The perils of the rigorous Arctic life, however, generally exceed that of disease among the Eskimos. The winter storms, with winds up to 100 miles an hour and blinding snow, may overcome the hunter. The treacherous Arctic sea and ice sometimes prove too much for the flimsy kayaks and take their toll each year. Only a few of the hunters live to a ripe old age. Ootak, who accompanied Peary to the Pole some 45 years ago, is among the very few patriarchs of the race and is a very respected and privileged person among the Greenlanders of Thule.

Since I left the area in the summer of 1951, the Eskimo village at Thule has disappeared. The large outpost of Western Civilization there, with its thundering jets and roaring transports, has driven away the seal and the ptarmigan and the hare. Encouraged wisely in the preservation of their normal way of life by the Danish Government, the North Greenlanders have pursued the game further north. By now they have found another and, I hope, equally prosperous fjord; but I wonder how long it will be before they are overtaken in their new community by the expanding perimeter of Western Defense.

Robert W. Hopkins, M.D.,
First Assistant Resident in Surgery

By devious or direct methods we manage to pick up valuable bits of information concerning addresses of our alumni and other matters. This letter from Dr. Oscar Swineford, Jr. (*W.M.* 1927) is an illustration:

> I was rather surprised to receive a "singleton" letter from you, because Dr. J. Edwin Wood, Jr. and Dr. William Parson are both colleagues of mine here in the Department of Internal Medicine at the School of Medicine, University of Virginia, Charlottesville, Virginia. Dr. Parson is Chairman of the Department of Internal Medicine. Dr. Wood and I are Professors of Internal Medicine. He is in charge of the Cardiology Division and I am in charge of the Allergy-Arthritis Division. Dr. Wood and I have been full-time members of the Department of Internal Medicine since our MGH days.

In explanation of why Dr. Swineford is listed in the Directory section of our Annual Report as being the only MGHer in Charlottesville: We inherited Dr. Wood's professional address as being the town of University, Virginia, when we took over the Directory in 1951. Dr. Parson sent us the same address (Univer-

No. 50 in a series of Staff photographs
Dr. Erich Lindemann — newly appointed Chief of Psychiatry Service

sity) in 1953. It appeared in the May 1953 issue of The News. We are grateful to Dr. Swineford for setting us right.

A letter has come from Lt. Col. SIGC Wilbour C. Lown, who was Head of our Photography Laboratory from 1930 to 1946. Col. Lown's present address is 278th Medical Detachment (Illustration), 406 Medical General Laboratory, APO 500, c/o Postmaster, San Francisco, California. He writes:

> Enclosed is a check for a subscription to The News. A short chat with Dr. F. D. Adams on his recent inspection trip reminded me that I knew entirely too little of what is going on in Boston and of those who might be over here whom I know.
>
> Where is here? It's a wet steamy day in Tokyo. The Japanese geta is better footgear than leather soles.
>
> How come? In July when the Army discovered that a promotion was due me, they also discovered that Lown should have some overseas duty. Both were remedied quickly. Arrived here in October; due back in 1956.
>
> What do I do? With nine darn good men I run a photographic unit, whose mission is to service the Far East Command. (?) It's fun being directly in photography again and, of course, in the basement. Everything I learned at the M.G.H. fits directly into the work here—an Army man in exactly the right spot—a miracle!
>
> My regards to everyone there.

Dr. Frank A. Mantz, Jr. (res. fel. *Path.* 1950) has sent us a change of address and information regarding his future plans. His letter reads:

> Since I have just resigned from the Regular Army, would you kindly direct future issues of The News to me at my permanent civilian address—2912 West 73d Street, Prairie Hills 13, Kansas.
>
> May I hasten to add that my separation from the Service has not been undertaken as a malcontent, since I have been more than favorably impressed with the excellence of medical practice in the Army and of the men who direct it. It is an interesting and challenging career, with many rewards, and we leave it with regret in order to establish a more stable environment for our growing daughter.
>
> I shall become associated with the Department of Pathology and Oncology of the University of Kansas Medical School, and with the Kansas City Veterans Administration Hospital where I shall be with Harlan Firminger, who is well remembered at M.G.H.
>
> We have enjoyed The News and the feeling of participation in MGH activities which it provides.

This letter has come from Dr. Sam M. Powell (a.r.p. *C.M.* 1947). His address is 301 Palmero, Corpus Christi, Texas.

> I should have sent you my correct address long ago, for I have been in private practice (Pediatrics) here since leaving the Massachusetts General in 1947.
>
> I suppose one would call my practice a successful one, judging from the number of patients I see and the hours I work!
>
> My family still consists of Polly, Peggy, and Sam III, and our home address is 3636 Ocean Drive.
>
> My professional appointments may be found in the *Directory of American Specialists.*
>
> I have had little time for vacations, aside from three or four week-long trips to Mexico each year to play in golf tournaments. I seem to be luckier south of the Rio Grande, and have won the Torreon, the Monterrey, and have been runner-up in the Tampico.
>
> Regards to all.

This letter from Dr. F. Dennette Adams gives us a roster of MGH-ers who are in the Far East:

> While on a mission to the Far East Command for the Surgeon General of the Army, it was my good fortune to encounter the following members of the MGH family:
>
> 1. Capt. Warren Bennett (*M.* 1948) — Medical Service, 382nd Army Hospital, Kanaoka
> 2. Capt. Herbert Giller (formerly an Eye and Ear resident) — Osaka Army Hospital, Osaka
> 3. Mrs. Eugene White (formerly a nurse at the Baker) — wife of Colonel White, Commanding Officer, 382nd General Hospital, Kanaoka
> 4. Lt. W. Allan Tisdale (*M.* 1952) — 34th Medical Battalion in the Eighth Army area
> 5. Capt. Austin L. Vickery, Jr. (a. path.) and Capt. Robert E. Scully (a. path.) — 406th Laboratory, Tokyo
> 6. Lt. Constance Ferebee (formerly a supervisor in the Bulfinch Building) — Tripler Army Hospital, Honolulu
> 7. Capt. Ann Jones (formerly staff nurse at the Phillips House) — Tokyo Army Hospital, Tokyo
> 8. Lt. Col. Wilbour C. Lown (formerly in charge of the Photographic Laboratory at M.G.H.) — in charge of the Photographic Department at the 406th Laboratory, Tokyo
>
> All of them seemed to be in good health; all of them were doing extremely creditable work and were very highly thought of by their colleagues and their superior officers; all expressed willingness to come home at any time.

With Dr. William H. Mathis, Jr. (r.p. *R.* 1948) it is a case of once an MGH "singleton" always an MGH "singleton". He writes:

> I am no longer in Greenville, South Carolina, having been dislocated by a two-year tour of duty in the Army.
>
> I am now Radiologist at Kennestone Hospital, Marietta, Georgia, and am still the only MGH-er in town, although there are a few in nearby Atlanta.
>
> For the benefit of those who don't know the location of Marietta — it is 18 miles north of Atlanta and is best known for its large aircraft plant that is producing B 47's. Of historical interest are the nearby battlefields of the Civil War.
>
> I have been here a year and am well pleased with the set-up. Kennestone is a new Hill-Burton hospital. It is already adding 50 beds and enlarging the X-ray Department.
>
> My wife is a former secretary of the MGH X-ray Department, so we will probably be up there this summer for a visit.

THE NEWS

No. 137 Boston, Mass. September 1954

PHYSICAL MEDICINE DEPARTMENT

This report covers progress over the two-year period since we last appeared in THE NEWS. The department has not changed in location or size, but for the first time in fourteen years it has been thoroughly redecorated and, in the case of Occupational Therapy, it has been redesigned to give it more functional use of the space for a greater variety of activities—including a small therapeutic kitchen for testing patients in the activities of daily living and helping them bridge the gap from hospital to home. There also has been established a new Occupational Therapy Section for the children in Burnham Memorial, realizing that Occupational Therapy plays an important therapeutic role in helping children adjust to hospitalization. The enlargement of this section of Occupational Therapy will make it possible to train student therapists there, and thus increase service to patients.

The changes in Physical Therapy have been largely in the skillful use of color and interesting decorative patterns, to make attractive a formerly very dull architectural area.

The department continues on a consultation basis, to provide diagnostic services consisting of electrodiagnostic tests, strength tests, and evaluation of functional abilities and prevocational analysis; Physical and Occupational Therapy are medically prescribed and directed for hospitalized and ambulatory patients. The total daily treatment load has not materially changed in this interval. The techniques employed have not been radically altered—the emphasis being on therapeutic exercises or kinetic and energic Occupational Therapy to improve functional achievement of patients, usually in relation to some disorder of the skeletal or neuromuscular systems, or in the training in the use of prosthetic devices in the case of amputees.

There has been a new physical procedure under clinical investigation—namely, ultrasound energy. This has been cautiously investigated with the help of Dr. Heuter of the Acoustic Laboratory at Massachusetts Institute of Technology. This form of energy has been found to be a useful therapeutic adjunct where deep localized heat is indicated. There has been some suggestion that it has unusual effectiveness in the treatment of painful amputation neuromata. What therapeutic value it may have in addition to heat, because of the mechanical action of this energy, is still under investigation.

During the last two years the Bay State Medical Rehabilitation Clinic has become a successfully functioning organization. Its relation to the Physical Medicine Department has been the subject of some question on the part of the Hospital staff—particularly the resident staff—as to the proper place for referral. It will accordingly be reiterated that the Physical Medicine Department of the Massachusetts General Hospital is set up to take care of diagnostic studies lying within the field of Physical Medicine, the prescription of Physical and Occupational Therapy, and the medical supervision of the same. The treatments in this department are on the whole for the more acutely ill, hospitalized patient, such as the patient with rheumatoid arthritis or early poliomyelitis who must be either treated in the bed on the ward or given only a short period of treatment in the Physical Medicine Department. This applies to both Physical and Occupational Therapy. Electromyography, electrodiagnostic testing, hydrotherapy, and ultraviolet treatments are available only through this department. Gait training is supervised, particularly for patients in for shorter periods of time and before they are able to tolerate a full-day treatment. In the Rehabilitation Clinic the in patients here are usually those with more static conditions, such as those with paraplegia when they are ready for ambulation training, some of the amputees who are ready for full-day treatments, and also hemiplegics in a similar category. Those patients in the Clinic receive treatment of from one to five hours a day. More emphasis is placed on prevocational analysis. There are also facilities available for psychometric testing and supportive therapy of psychological nature if needed, and investigation of social and economic factors as related to rehabilitation. There is also more emphasis on group therapy, rather than individual therapy which is true in the Physical Medicine Department. There are no fundamental differences as far as financial matters are concerned between the two departments, and they should not affect decisions as to referrals. The final decision as to acceptance in the one unit or the other rests in the hands of the medical directors of the two departments, who must determine where the patient is to receive the best medical care.

Although the term "Rehabilitation" is not included in the title of the Physical Medicine Department, the department does not lack interest in this aspect of Physical Medicine. Evaluation as to rehabilitation goals is possible in the Physical Medicine Department through examinations by the visiting staff and residents and the Physical and Occupational Therapy staffs.

In addition to service to patients, the Physical Medicine Department has continued to function extensively along educational lines. This has been primarily directed toward student therapists affiliated with the department, who have come from local schools connected with Boston University, Tufts College and Simmons College in Physical Therapy, Boston School of Occupational Therapy, and numerous out-of-State schools of Occupational Therapy. This training is primarily clinical in nature, but the staff is called upon to give many didactic lectures in both Physical and Occupational Therapy. The training school is also interested in receiving instructions from the department for the nurses at the Hospital. The department and staff frequently participate in postgraduate courses given at the Hospital, and to some extent in the training of undergraduate medical students. We continue to run a clinical fellowship program which receives no support from the Hospital, but the fellows have received grants from the National Foundation of Infantile Paralysis and the U.S. Public Health Service in recent years, whereas previously they received support from a grant from the Baruch Committee on Physical Medicine and Rehabilitation.

There have been numerous changes in the technical staff in both Physical and Occupational Therapy. This rather rapid turnover has usually been due to changes in family status of the personnel, all of whom are women. Miss Mary E. Nesbitt, our chief physical therapist, has remained with us and continues to receive additional honors. She was chosen to make an extensive trip as a guest of the U.S. Navy—an honor to her and to the Hospital. This has been reported in some detail in *The World* of the M.G.H. In the spring of this year she took a leave of absence to study a new technique in muscle re-education at the Kabat-Kaiser Clinic at Vallejo in California, and now returns to us eager to contribute new knowledge gained on what appears to be a definite advance in the technique of muscle re-education. We are looking forward to studying this in the future and we hope thereby to improve the results of Physical Therapy. We are pleased to report that while she was in California, attending the annual meeting of the American Physical Therapy Association, she was elected President of this national organization for the coming year—the highest honor a physical therapist can receive.

All have been impressed by the rapid strides made in our Occupational Therapy Department since it was taken over by Mrs. Cohen. In addition to the obvious changes in appearance and functional organization, plans have been well organized to improve it as a therapeutic service and teaching unit in the Hospital.

Research: Our research program has not been as active as in some previous years, as our fellows have devoted their time almost exclusively to clinical training. There have been some clinical investigations completed, including the study of the effects of glycocyamine in poliomyelitis. Clinical studies are also being continued in ultrasound, electromyography, and strain gauge measurements of strength. Several clinical papers have been published on these subjects.

The next logical step in the future development of the department would seem to be the establishment of a rehabilitation bed service, as experience has indicated that the best plan for coordinating the numerous medical services needed for rehabilitation is under the direction of a single physician or service specializing in coordination and employment of Physical Medicine and Rehabilitation procedures. This type of service has been successfully in operation in the Baker Memorial, particularly with the special arrangements for taking care of United Mine Workers' seriously disabled patients. A more efficient use of beds, nursing service, and Physical Medicine Rehabilitation services, as well as medical care of the patients, would appear to be inevitable with the development of such facilities.

The organization of such a department might make it possible to utilize it to better advantage in the orientation and training of the resident staff of the Hospital. The present department, although centrally located, is somewhat isolated from the ward services; and, as the resident staff is not obligated to visit or spend time in the department, except for special instances, the resident staff learns nothing of Physical Medicine and Rehabilitation procedures by direct observation or by means of clinical responsibilities which reside entirely in the department. There would seem to be a definite need for further education of the resident staff and, indirectly, the visiting staff through closer coordination of Physical Medicine services with other areas of medical care in the Hospital. This education should continue along its natural course, to include follow-through of patients who continue on in the Bay State Medical Rehabilitation Clinic to conclude their treatment before referral for vocational training or placement by established outside agencies.

Massachusetts General Hospital friends are invited to visit the Physical Medicine Department, inspect the "new look", and watch it function in both Physical and Occupational Therapy.

Arthur L. Watkins, M.D.,
Chief of Physical Medicine

* * *

The Edward Peirson Richardson Lecture, in Clinical Science, was presented on June 28 by Douglas M. Jackson, M.A., M.D., F.R.C.S., Surgeon to the Medical Research Council Burns Unit of Birmingham, England. Dr. Jackson's subject was "Investigation and treatment of burns".

* * *

A memorial fund to continue the work of Dr. Ira T. Nathanson has been started by some of his friends. All those who wish to subscribe should make their checks out to the Massachusetts General Hospital, marked Ira T. Nathanson Memorial Fund. Such contributions are deductible for income tax purposes. The fund will be used to continue the work on the relation of the internal secretions to cancer—the problem to which Dr. Nathanson was so ardently dedicated.

* * *

Dr. Fiorindo A. Simeone, one of our well-known former staff members and now Professor of Surgery at Western Reserve University and Director of Surgery at Cleveland City Hospital, was awarded an honorary degree of Doctor of Science from Brown University on June 7. The citation from Dr. Henry M. Wriston, President of Brown University, reads:

> Brilliant throughout your formal education, filled with the insistent desire to investigate which characterizes research leaders, in the hospital and on the battlefield, with ingenuity and persistence, you sought the answers to questions accurately described as vital. As a teacher you have led important curricular reforms, as an administrator you have organized an extraordinary surgical service. Because of your manifold contributions to mankind, we welcome you home. . . .

The Board of Trustees, at their meetings during June and on July 23, voted:

To accept with regret the resignations of:

Dr. Henry H. Brewster as Assistant Psychiatrist, effective June 30;

Dr. Richard R. Evans as Assistant in Medicine, effective June 30;

Dr. Robert H. Fennell, Jr. as Assistant Pathologist, effective June 30;

Dr. Ivan D. Frantz, Jr. as Assistant Physician, effective June 30;

Dr. John W. Raker as Assistant in Surgery, effective September 30.

To grant leave of absence to:

Dr. Edward D. Churchill, from June 15 through September 15;

Dr. Anne P. Forbes for one year, beginning September 1;

Dr. George L. Nardi, because of military service, effective July 1.

To appoint:

Dr. Kenneth T. Bird as Assistant in Medicine, beginning August 1;

Dr. Bertil Bjorklund as Visiting Assistant Bacteriologist, assigned to Gynecology, for the period June 15 through August 30;

Dr. Charles S. Keuper as Assistant in Dermatology, effective July 1;

Dr. Zwi Laron as Out-Patient Resident on the Children's Medical Service, beginning September 1;

Dr. Cesare T. Lombroso as Assistant Resident in Neurology, beginning July 1;

Dr. Alfred J. Luessenhop as Second Assistant Resident in Neurosurgery, beginning July 1;

Dr. Colin M. MacLeod to the Scientific Advisory Committee;

Dr. Vernon H. Mark as Senior Resident in Neurosurgery for one year, beginning July 1;

Dr. Demetrios A. Papadopoulos as Assistant Resident in Urology, beginning July 1;

Dr. Murray Rabinowitz as Assistant Resident in Medicine, effective July 1;

Dr. Leon Reznick as Assistant in Dermatology, effective July 1;

Dr. Richard L. Rovit as Second Assistant Resident in Neurosurgery, beginning July 1;

George A. Talland, Ph.D. as Assistant Psychologist, beginning July 1;

Dr. William M. Thurlbeck as Third Assistant Resident in Pathology for one year, beginning July 1, 1955;

Dr. Alexander B. Timm, Jr. as Assistant Resident in Dermatology for one year, beginning July 1;

Dr. Shen K. Wang as Assistant Resident in Orthopedic Surgery, beginning April 1, 1955.

The Trustees also voted that the appointment of Dr. James V. Cable be that of Visiting Physician pro tempore rather than Clinical Fellow in Medicine, retroactive to March 1.

At their meetings during June and on July 21, the General Executive Committee voted:

To promote:

Dr. Leonard Atkins to the position of Resident in Pathology for one year, beginning July 1;

Dr. Richard C. Austin to the position of First Assistant Resident in Surgery, effective July 1;

Dr. Charles R. Campbell to the position of Resident in Pathology for one year, beginning July 1;

Dr. Edwin L. Carter to the position of Third Assistant Resident in Surgery, effective July 1;

Dr. Robert C. Coe to the position of First Assistant Resident in Surgery, effective July 1;

Dr. John D. Constable to the position of Second Assistant Resident in Surgery, effective July 1;

Dr. Richard R. Curtin to the position of Second Assistant Resident in Surgery, effective July 1;

Dr. Harry B. Ditmore, Jr. to the position of Third Assistant Resident in Surgery, effective July 1;

Dr. Hugh R. Dudley, Jr. from the position of Assistant Resident to that of Clinical Fellow in Pathology for one year, beginning July 1;

Dr. Edward L. Ferguson to the position of Third Assistant Resident in Surgery, effective July 1;

Dr. Ira A. Ferguson, Jr. to the position of Second Assistant Resident in Surgery, effective July 1;

Dr. Frank W. Garran, Jr. to the position of First Assistant Resident in Surgery, effective July 1;

Dr. John Gergely to the position of Associate Biochemist in Medicine, retroactive to October 1, 1953;

Dr. Donald J. Glotzer to the position of Second Assistant Resident in Surgery, effective July 1;

Dr. Fairfield Goodale, Jr. from the position of Assistant Resident to that of Clinical Fellow in Pathology for one year, beginning July 1;

J. Delafield Gregory, Ph.D. to the position of Associate Biochemist in Research Chemistry, retroactive to August 1, 1953;

Dr. Hermes C. Grillo to the position of Resident in Surgery, effective July 1;

Dr. John M. Head to the position of Second Assistant Resident in Surgery, effective July 1;

Dr. William H. Hendren, III, to the position of Second Assistant Resident in Surgery, effective July 1;

Dr. Mahlon B. Hoagland to the position of Associate Biochemist in Medicine, retroactive to September 1, 1953;

Dr. Benjamin B. Jackson to the position of Second Assistant Resident in Surgery, effective July 1;

Dr. Raymond A. Justi to the position of First Assistant Resident in Pathology for one year, beginning July 1;

Dr. Robert B. Loftfield to the position of Associate Biochemist in Medicine, retroactive

to September 1, 1953;
Dr. John A. Malcolm to the position of Second Assistant Resident in Surgery, effective July 1;
Dr. Harold L. May to the position of Third Assistant Resident in Surgery, effective July 1;
Dr. Federico Mora to the position of First Assistant Resident in Neurosurgery, effective July 1;
Dr. George F. Odland to the position of Resident in Dermatology for one year, beginning July 1;
Dr. James A. Petersen to the position of First Assistant Resident in Radiology, effective July 1;
Dr. Jens G. Rosenkrantz to the position of Third Assistant Resident in Surgery, effective July 1;
Dr. Edwin W. Salzman to the position of Third Assistant Resident in Surgery, effective July 1;
Dr. David B. Sheldon to the position of First Assistant Resident in Surgery, effective July 1;
Dr. Eji Suyama to the position of First Assistant Resident in Surgery, effective July 1;
Dr. Julio Toriello to the position of Resident in Radiology, beginning July 1;
Dr. Roger E. Wilcox to the position of First Assistant Resident in Surgery, effective July 1;
Dr. George D. Zuidema to the position of Third Assistant Resident in Surgery, effective July 1.

To reappoint:

Dr. Saul Aronow as Research Fellow in Physics for one year, beginning July 20;
Dr. John S. Barlow as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Mandel E. Cohen as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Allan St. John Dixon as Clinical and Research Fellow in Medicine for one year, beginning July 1;
Dr. Jacques O. Gagnon as Clinical Fellow in Medicine for one year, beginning July 1;
Dr. Ruth C. Haynes as Assistant Resident in Anesthesia for one year, beginning August 1;
Dr. Sholem Postel as Clinical and Research Fellow in Medicine for one year, beginning July 15;
Dr. Paul S. Russell as First Assistant Resident in Surgery, for the period July 1 through July 31;
Karl Schmid, Ph.D. as Assistant Biochemist in Medicine for one year, beginning July 1;
Dr. James M. Shannon as First Assistant Resident in Surgery, effective August 4;
Dr. Raymond D. Sphire as Assistant Resident in Anesthesia for one year, beginning August 1;
Dr. James L. Vanderveen as Assistant Resident in Anesthesia for one year, beginning August 15;
Dr. Oscar B. Williams, Jr. as Assistant Resident in Anesthesia for one year, beginning July 27.

To extend the appointments of:

Dr. Alexander C. Ritchie as Assistant Resident in Pathology, from June 30 through August 31;
Dr. Guillermo C. Sanchez as Clinical Fellow in Medicine, assigned to Cardiology, through September 30;
Dr. Ming K. Wang as Clinical and Research Fellow in Medicine, assigned to Allergy, through December 31.

To appoint:

Dr. Robert S. Adams as Clinical Fellow in Psychiatry, for a period of six months, beginning July 1;
Dr. Gregory Bard as Clinical Fellow in Physical Medicine, for the period August 15 through September 2;
Dr. Norman R. Bernstein as Clinical Fellow in Psychiatry for one year, beginning July 1;
Dr. David Bowsher as Clinical and Research Fellow in Neurosurgery for one year, beginning September 1;
Dr. Michael Cooke as Fellow in Anesthesia for one year, beginning February 1, 1955;
Dr. John C. Dalton as Clinical Fellow in Medicine, assigned to Cardiology, for one year, beginning July 1;
Dr. Nathaniel J. Ehrenkranz as Clinical and Research Fellow in Medicine, for the period July 1 through December 31;
Dr. Leon Goldberg as Research Fellow in Anesthesia, effective as of June 14;
Dr. Salomon Hakim as Research Fellow in Neuropathology, for a period of six months, beginning July 1;
Dr. William K. McClelland as Clinical Fellow in Surgery, for the period July 1 through December 31;
Dr. Clare K. Marshall as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. John A. Scholl as Clinical and Research Fellow in Neurosurgery for one year, beginning July 1;
Dr. Mary L. Scholl as Clinical and Research Fellow in Neurology for one year, beginning July 1;
Dr. Madan M. Singh as Clinical and Research Fellow in Medicine, effective October 15;
Dr. Joseph Stokes, III, as Clinical Assistant in Medicine, beginning July 1;
Dr. Peter M. Tow as Research Fellow in Psychiatry, assigned to a project under Dr. J. C. White, for a term of six months, beginning July 1;
Dr. Clarival doP. Valladares as Graduate Student Assistant in Pathology, effective as of December 1, 1953;
Dr. Bryan Williams, Jr. as Clinical Fellow in Medicine, assigned to Cardiology, for one year, effective July 1.

To change the titles of:

Dr. Morris E. Chafetz from that of Clinical and Research Fellow to that of Clinical Assistant in Psychiatry;
Dr. James F. Patterson from Clinical Fellow to that of Clinical Assistant in Dermatology.

* * *

ACTIVITIES OF THE HEMATOLOGY LABORATORY

The Hematology Laboratory (or, as it is officially entitled, Dr. Jacobson's Laboratory) has been carrying on for several years with a number of functions. These can be classified as: teaching, rendition of consultative services, and research.

The teaching functions have continued as previously, and include formal instruction in a session every two months with each new batch of Clinical Clerks on the Medical Service, and fourth year students during a one-month full-time course entitled "Medicine XIV, Hematology, Massachusetts General Hospital", as well as lectures in the summer course in Internal Medicine. Probably more important are the numerous opportunities for informal teaching to Clinical Clerks and members of the House Staff through consultative services rendered to help solve hematological problems in all parts of the Hospital. The members of the House Staff call on us frequently (over 100 times a year) and the Visiting Staff at the Baker Memorial, Phillips House, and Eye and Ear Infirmary also enlist our interest and sometimes our help to an increasing extent (over 200 times a year). The efficiency of our consultative service has been augmented by the moving of our laboratory to its new quarters on the fifth floor of the Domestic Building. The Clinical Clerks, House Staff, and also Visiting Staff are always invited to the laboratory to share our observations of the blood and of the bone marrow and to discuss hematological problems. Our laboratory tries to stress what we consider simple but good hematological techniques. At this point I would like to note the tremendous expansion of frequency of bone marrow examinations in patients in whom the clinical findings and the observations of the peripheral blood do not suffice for an exact diagnosis. With each contingent of new Clinical Clerks and House Officers the teaching is obviously a continuing process. In addition, during the past year and one-half there has been assigned to us for a period of several months a Resident from the Pathology Department for training in clinical hematology. This training program has worked out well for both our laboratory and for the man who wants to obtain training that will fit him for all types of clinical-pathological activities.

Our investigative activities have been limited by several factors, but notably by the lack of full-time professional personnel. This situation, we hope, will soon change for the better. Our interests include various aspects of the pathogenesis and of the diagnosis of pernicious anemia, the hemolytic anemias, and multiple myeloma, but our major interest is in the field of hemorrhagic disorders.

Nothing is more dramatic in the practice of medicine than confrontation with the problem of why the patient bleeds spontaneously from any source, or bleeds abnormally after trauma, or after operative intervention. When one is confronted with a bleeding problem one should try to analyze the disturbance as being caused by one of three different mechanisms: defects in capillary permeability, defects in the coagulation mechanism, or defects in platelets.

To date, this laboratory has touched only lightly on investigation of defects in the coagulation mechanism, but we have concentrated on the other two bleeding mechanisms. During the past few years we have considerably expanded our previous finding that in many individuals with chronic idiopathic thrombopenic purpura the administration of corticosteroids is followed by a sharp rise of platelets to near normal or normal levels, and this therapeutic procedure has had much practical application, in either preparing the patient for splenectomy, or in tiding over a bleeding episode the patient who is again in thrombopenic relapse, despite previous splenectomy. It might be well at this point to summarize our results as follows, describing the responses of the platelets to short-term corticosteroid therapy:

NO. OF CASES	NONE	FAIR	GOOD
16	7	1	8

It should be brought out that of those individuals who did not respond to corticosteroids, approximately one-half did respond to splenectomy; on the other hand, every individual who responded to corticosteroids also responded to splenectomy.

The defects in capillary permeability have continued to constitute our main investigative interest, and more particularly the type of hemorrhagic disorder that we have classified as idiopathic bleeding time defect (IBTD). This term is quite analogous to the purely descriptive diagnostic term idiopathic thrombopenic purpura (ITP). This disorder (IBTD) has been variously described in the literature as "pseudohemophilia", "hereditary hemorrhagic thrombasthenia", "purpura hemorrhagica without thrombopenia", "hereditary hemorrhagic diathesis", "atypical hereditary hemorrhagic syndrome", and by still other terms. That we are encountering this disorder more and more frequently is illustrated by the following data on the diagnosis of major hemorrhagic states in this Hospital during the years 1951 and 1952:

	NO. OF CASES
Hemophilia	8
ITP	13
IBTD	24

Since the above table was constructed the incidence has continued to grow and at this writing totals approximately 65 cases. In fact, during just the month of July 1954 six such individuals have been in the Hospital as in patients.

Patients with this bleeding disorder include individuals in whom there is no pertinent organic disease, such as severe sepsis, renal or hepatic insufficiency, or neoplasm, and in whom the platelets, coagulation time, and prothrombin time are normal. The one defect among all these patients is a prolonged bleeding time, and the apparent increase in the frequency of these cases in this Hospital can probably be ascribed to our improved method of determining the bleeding time. This method involves a 3 mm. deep and 3 mm. long incision on the volar aspect of the forearm, under certain standardized conditions, and by this method the upper border of normal is 6½ minutes. The conventional method of determining the bleeding time consists of a needle puncture of an ear lobe, with the usual normal range quoted as 1 to 3 minutes. A comparison of the results of the two methods among six unselected patients in our series is illustrated by the following data:

PATIENT NUMBER	ROUTINE METHOD (min.)	AUTHOR'S METHOD (min.)
1	4, 2½	14½
2	3½	10
3	12, 8½	30
4	2½	15½, 12
5	1½	9½
6	3½	11½, 8½

It is thus apparent that only one of the above individuals could be picked up as a bleeder by the routine method.

It must be emphasized that the classification of patients under this heading remains a tentative one, and very possibly further investigation of the physiological defects in these individuals will more accurately break up this group into subdivisions under different pathogenic mechanisms. This is actually happening at present to what has been called from time immemorial "hemophilia", and which is now being subclassified as "hemophilioid states", "anti-hemophilic globulin deficiency", "plasma thromboplastin component deficiency", and "plasma thromboplastin antecedent deficiency".

Some of the clinical aspects of the individuals with IBTD deserve mention. These individuals are about evenly divided between the sexes. In about one-half of the cases there is a definite family history of bleeders in either sex. This disorder may be congenital or acquired. The sites of spontaneous bleeding, in contrast to the sites of bleeding in hemophilia, are predominantly from the nose, the uterus, and in the skin, and only rarely in the central nervous system, the retina, the gastro-intestinal tract, or in the urinary tract. Bleeding into the muscles and joints following trauma, so common in hemophilia, has not been noted in any of our patients. Abnormal bleeding, of course, occurs at the site of any laceration and from any operative trauma. It is also of interest to note that despite the high incidence of meno-metrorrhagia, hemorrhage during pregnancy or postpartum hemorrhage are very unusual (only 2 of 14 deliveries among 7 women).

Up until recently the treatment of patients with this bleeding tendency has been very unsatisfactory. Unlike hemophilia, fresh blood appears to have no influence on the bleeding or on the bleeding time, nor is there any effect from massive doses of ascorbic acid or of vitamin P preparations (Rutin, Hesperidin). Some four years ago we began observations on the effects of corticosteroids on both the bleeding time and the bleeding tendency. To date, we have run approximately 45 trials of corticosteroids among approximately 35 patients. In two patients there was no effect whatever on either the bleeding tendency or the bleeding time, but in the remainder the bleeding time fell significantly after two days of treatment and reached a normal value after three to four days of treatment and remained at that level as long as an adequate dose of the corticosteroids was maintained. In many instances the bleeding time fell to a normal range within 24 to 36 hours after beginning treatment. This therapeutic tool has proved of great value in tiding a patient over a bleeding episode, and in the preparation of a known bleeder for surgery. The reader who is interested in further details is referred to our paper, "Effects of cortisone and of corticosteroids on prolonged bleeding time: Treatment in certain hemorrhagic states (pseudohemophilia)", A.M.A. Archives of Internal Medicine, *92*: 471-477, October 1953.

What our laboratory lacks in space is counterbalanced by the curiosity and enthusiasm of our investigative personnel, and we hope that the activities of the Hematology Laboratory will continue at a productive level.

Bernard M. Jacobson, M.D.,
Head of the Hematology Laboratory

VOLUNTEER GROUPS

MGH Staff Wives Hospital Committee

On Saturday, September 25, Dr. and Mrs. Oliver Cope together with Dr. and Mrs. Walter Bauer will give an outdoor supper party for the surgical and medical house staff and clinical fellows who have recently started appointments at the Hospital. The party for these doctors and their wives will be given on the adjoining grounds of the Bauers and Copes in Cambridge.

* * *

Dr. Leon R. Lezer, Assistant Director at M.G.H. from 1950 through July 31, 1954, is now Assistant Professor of Preventive Medicine at the College of Medicine, Burlington, Vermont. Just before he departed from the Hospital, he sent us this letter, which will be much appreciated by all who knew Dr. Lezer.

To have been asked by the editor of The News to write a "swan song" was an unexpected invitation that I hastened to accept. However, it is indeed difficult to put into appropriate words an adequate expression of what my association with the Massachusetts General Hospital has meant to me.

To have had responsibility in an institution like the M.G.H. is a unique privilege. I am confident there is only one medical institution that can give all the variety and richness of experience in such abundance as may be gained at the Massachusetts General. As gratifying, delightful, and rewarding as that experience is, it is at the same time sobering when one reflects upon the great history in medicine created by MGH men and women of magnanimity, courage, and foresight. To sense the challenge of contributing to that glorious record, in however small a way, is to pause in humility at the magnitude of the obligation.

With deep appreciation of the assistance and cooperation of the Chiefs of Services, Visiting Staff, and House Staff, I fully realize that without this assistance and cooperation the mutual aim and ever-present task of providing a better place where sick patients may become well cannot be realized. After half a dozen years of hospital administration, I am convinced that it is the Department Head who, in the last analysis, "makes the difference". It has been a pleasure to have had the experience of working with the Department Heads at the M.G.H. It is rewarding to have had the opportunity to associate and work with those who, because of their special knowledge, sound judgment, and sincere interest in the welfare of mankind, are in demand far beyond the walls of the Hospital.

Although it is not possible in as large an institution as this for many to come to know the Trustees well, it is everywhere apparent that the governing body of the M.G.H. is devoted and dedicated to the tremendous task which they execute so well. It was indeed inspiring to see these citizens come so regularly to the Hospital, with such steadfastness of purpose, carrying the heavy burden quietly, efficiently, and behind the scenes of the every-day Hospital activities. Their remuneration must be a deep sense of satisfaction in making such a magnificent contribution to the world—because the M.G.H. is a hospital whose community *is* the world.

It is certain that the hospital of tomorrow will be an even greater community force than it is today, solving the problems of both the sick and the well. It is equally certain that the M.G.H. will be in the foreground of this great panorama of total community care in health and sickness.

With gratitude to Dr. Dean Clark and the Trustees of the Hospital, I leave for work in my home State, better prepared for the tasks ahead and gratefully taking with me some of the spirit of the Massachusetts General that over the years has made her a fountain of knowledge for those who seek knowledge, an arsenal of learning for those who seek answers to unsolved problems, a source of help and healing to the pain-stricken and diseased body, and an inspiration to men and women from all over the earth. As the Massachusetts General Hospital continues to lead the ranks in this changing world, may the men and women who will have the privilege of sharing its glory in the future be blessed with the insight, courage, and foresight with which their predecessors were so richly endowed.

MASSACHUSETTS EYE & EAR INFIRMARY

During the summer months, the Infirmary welcomed two new residents to its staff.

Dr. Neil F. Thorlakson joined the Ophthalmology Service for resident training. He received his undergraduate training at the University of Washington and was graduated with a B.S. degree in 1949. He received his M.D. from Harvard Medical School in 1952, after which he served a rotating internship at the King County Hospital System in Seattle, Washington, from July 1952 to July 1953.

Dr. Alfred L. Hurst arrived at the Infirmary on July 1 to receive residency training in Otolaryngology. Dr. Hurst is a graduate of Brown University, from which he received his B.S. degree in 1949, and of Tufts Medical School, which awarded him his M.D. degree in 1953. He served as a junior intern at the Cape Cod Hospital in Hyannis during the summer of 1952, and acted as surgical intern at the New England Medical Center from July 1953 to July 1954.

At a meeting of the Executive Committee of the Infirmary on June 21, it was voted to promote Drs. Joseph M. Clough, W. Morton Grant, Charles H. MacLaughlin, and Francis J. West from Assistants to Assistant Surgeons in Ophthalmology.

At the same meeting, Drs. Irving Pavlo and Knud K. Dreisler were appointed Assistants in Ophthalmology.

Four members of the Infirmary's Consulting Staff died during the summer months. Dr. Edmund W. Clap and Dr. Hugo B. C. Riemer were former Consultants in Ophthalmology—Dr. Clap having been on the staff since 1901, and Dr. Riemer since 1929. Dr. Harry A. Barnes and Dr. Josiah E. Quincy were members of the Otolaryngology Consulting Staff. Dr. Barnes served the Infirmary for 43 years as a staff member, and Dr. Quincy for 28 years.

Three doctors completed their residencies this summer. Drs. Peter Beck and Bernard Zeavin both ended their training in Ophthalmology on August 1. Dr. Beck has accepted a position at the U.S. Naval Hospital in Portsmouth, New Hampshire.

Dr. Edmundo T. L. Spinola completed his residency in Otolaryngology on July 15, and is now touring the United States before returning to his home in Brazil to practise.

A staff meeting, arranged by the Postgraduate Medical Institute, was held at the Cambridge City Hospital on June 24. At this meeting, Dr. Arthur M. Morrissey, Assistant in Ophthalmology at the Infirmary, presented his paper on "Pathophysical variants of retina in medical diseases".

Three visiting physicians are observing and studying in different departments of the Infirmary. Dr. Silvio Pirquet is observing in the Retina Service for six months. Dr. Pirquet comes to us through a fellowship from Zurich, Switzerland.

Dr. Wallis Friedman, a Heed Fellow, is currently studying retinal pathology and retinal detachment in the Howe Laboratory. He expects to be with the Laboratory for six months.

Dr. Joseph Dowling is participating in a study of the eyes of twins, in the Howe Laboratory. He has come to us through a Public Health Grant and will remain until the end of September.

Dr. Herman J. Sternstein, of the Otolaryngology Service, recently received special recognition from the American Triological Society for his paper, "Combined use of antibiotic and vasodilator therapy in ozena". Dr. Sternstein's paper was submitted as a thesis in his candidacy for membership in the Society, and because of its excellence and value was rated among the first three of the many submitted by the large field of candidates.

A note concerning Dr. David E. S. Wishart (*Aural* & *L.* 1922) was included in the material sent to THE NEWS for the Eye and Ear column which appeared in our July-August issue. As a result, THE NEWS has received this letter from Dr. Wishart:

> Thank you very much for sending me the July and August copy of THE NEWS. It was very kind of you to mention my name.
>
> Unfortunately, there is a serious error. I was not elected President of the American Otological, Rhinological and Laryngological Society, but I had the honour to be elected President of the much older Society—the American Otological Society. I am very proud that I received my stimulus and early training in ear work at the Massachusetts Eye and Ear Infirmary.
>
> I also would be glad if you would see that my address is listed as 526 Medical Arts Building, 170 St. George Street, Toronto 5, Canada. I have not had my office at 47 Grosvenor Street for many years.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of THE NEWS, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Anesthesia

Beecher, H. K.
Anesthesia.
In Commemorative volume: Seventy-five years of medical progress, Philadelphia, Lea & Febiger, pp. 13-28.

Beecher, H. K.
A note on spinal anesthesia and its relationship to a larger problem. (Editorial)
Surgery 35:820-821.

Lasagna, L., Mosteller, F., von Felsinger, J. M., and Beecher, H. K.
A study of the placebo response.
Am. J. Med. 16:770-779.

Rudin, D. O., and Eisenman, G.
The action potential of spinal axons in vitro.
J. Gen. Physiol. 37:505-538.

Laboratory Science

Burrage, W. S., Irwin, J. W., Gallemore, J. I., and Wang, D. M. K.
Effects of histamine and epinephrine on the small pulmonary blood vessels of living rabbits.
J. Allergy 25:293-301.

Waksman, B. H., and Bocking, D.
A comparison of leukocyte lysis with certain other immunologic phenomena demonstrable in sera of tuberculous rabbits.
Am. Rev. Tuberc. 69:1002-1015.

Neurology, Neurosurgery, and Psychiatry

Badal, D. W.
Psychiatric observations in neurocirculatory asthenia.
J.A.M.A. 154:1054-1058.

Bakay, L.
Studies on blood-brain barrier with radioactive phosphorus. IV. Spatial aspects of phosphate exchange between plasma and brain.
A.M.A. Arch. Neurol. & Psychiat. 71:673-683.

Bakay, L., Crawford, J. D., and White, J. C.
The effects of intravenous fluids on cerebrospinal fluid pressure.
Surg., Gynec. & Obst. 99:48-52.

Cobb, S., Quarton, G. C., and Clark, L. D.
Mental symptoms of endocrine disorders.
In Medical uses of cortisone, New York, The Blakiston Company, pp. 506-518.

Cobb, S., and Sloane, R. B. (Editors)
Depersonalization simulating epilepsy.
Am. Pract. & Digest Treat. 5:425-429.

Neurophysiology

Barlow, J. S., and Brazier, M. A. B.
A note on a correlator for electroencephalographic work.
EEG & Clin. Neurophysiol. 6:321-325.

Brazier, M. A. B.
The Laurentian syndrome on the electrical activity of the cortex as affected by the brain stem reticular system in relation to states of consciousness.
EEG & Clin. Neurophysiol. 6:355-359.

Otolaryngology

Weille, F. L., Gargano, S. R., Pfister, R., Mar-

tinez, D., and Irwin, J. W.
Circulation of the spiral ligament and stria vascularis of living guinea pig.
A.M.A. Arch. Otolaryng. 59:731-738.

Pathology

Morgan, W. S.
The probable systemic nature of Mikulicz's disease and its relation to Sjögren's syndrome.
New England J. Med. 251:5-10.

Sterility

Simmons, F. A.
The diagnosis and treatment of the infertile female: A monograph in American Lectures in Endocrinology.
Springfield, Ill., Charles C. Thomas.

Simmons, F. A.
Diagnostic value of testicular biopsy.
In Modern Medicine Annual, Minneapolis, Modern Medicine, pp. 52-56.

Simmons, F. A.
The hypogonadal male. (Editorial)
Fertil. & Steril. 5:201-204.

Simmons, F. A.
Routine diagnostic studies of the infertile female.
In Sociedade Brasileira de Esterilidade, Rio de Janeiro, Brasil, p. 381.

Simmons, F. A.
Sterility, female.
In Current therapy, 1954, Howard F. Conn, Editor, Philadelphia, W. B. Saunders Company, pp. 798-801.

Miscellaneous

Barr, J. S., et al.
Report of the joint committee for the study of surgical materials.
J. Bone & Joint Surg. 36-A:411-424.

Books

Gertler, M. M., and White, P. D.
Coronary heart disease in young adults: A multidisciplinary study.
Cambridge, Massachusetts, Harvard University Press.

* * *

Dr. Joe V. Meigs has been invited to deliver the principal address at the One Hundredth Anniversary of Touro Infirmary in New Orleans, on October 15. Dr. Meigs is going as a representative of Massachusetts General because Touro Infirmary wishes to remind us and them of our special relationship, due to the fact that both institutions received handsome gifts from the Touro brothers many years ago. In that connection, it is interesting to note the following from our Hospital records:

On March 19, 1854, our Trustees received a communication from the executors of the estate of the late Judah Touro of New Orleans, announcing a legacy in his will of $10,000 to the Hospital. The following preamble and vote were unanimously adopted:

> More than thirty years ago there died in this city one, of Jewish faith and parentage, who bequeathed to this institution the sum of $10,000. The name of Abraham Touro has thenceforth been familiar to us as that of one of our chief benefactors. And now another of the same name and lineage, an eminent merchant, who for fifty years has resided in the distant city of New Orleans, has, by like liberal bequests, remembered the home of his own youth and its various charitable institutions which were the objects of his brother's bounty; therefore—
>
> *Voted,* That the Trustees, in accepting the legacy of the late Judah Touro, recognize in it an act prompted by fraternal love and a philanthropy not confined within the narrow bounds of time, place, or sect."

A valuable portrait of Abraham Touro, painted by Gilbert Stuart, hangs in the corridor leading to our Trustees' Room. An interesting *Life of Judah Touro, 1775-1854,* by L. Huhner, was published in 1946.

* * *

How often we call a building or a department by its particular name without remembering or, perhaps, even knowing why its title was bestowed upon it. This thought came to our mind while we were working along on a chronology of outstanding events in the history of the Massachusetts General Hospital. It concerns the name of our nurses' library — the Palmer-Davis Library, in the Moseley Building.

The Annual Report of the Hospital for 1940 gives information about Miss Palmer and Miss Davis which, in our estimation, is worthy of being quoted here, in case some of the details regarding the careers of these two women may have been forgotten. On page 69 of the Annual Report for 1940, in the section on the School of Nursing, is the following:

"The greatest single accomplishment of the year is the new school library. It is named the Palmer-Davis Library, in memory of two of our outstanding alumnae, members of the class of 1878. Miss Sophia Palmer was the first Editor of the American Journal of Nursing; Miss [Mary] Davis was the first business manager of the American Journal of Nursing. Together they founded our Alumnae Association. Miss Palmer was Superintendent of St. Luke's Hospital in New Bedford, then of the Garfield Hospital in Washington, D. C., and next of the Rochester General Hospital in Rochester, New York. She was a member of the committee that organized the oldest organization of nurses in the country, the American Society of Superintendents of Training Schools for Nurses. She was also a member of the committee that organized the American Nurses Association, the second oldest organization of nurses in this country. Miss Davis was Superintendent of the University of Pennsylvania Hospital in Philadelphia. She, too, was a member of that committee which founded the American Society of Superintendents of Training Schools for Nurses. She was one of the first to recommend the teaching of the preliminary course of a hospital school of nursing in a college or university and was one of those who recommended the preliminary course which is still given at Simmons College. It is interesting to know that both Miss Palmer and Miss Davis were pupils of Linda Richards, 'The First Trained Nurse in America'."

BIOGLETS

Dr. David W. Allen, Intern in Medicine—born in Johnson City, N. Y., April 16, 1927; U.S. Army: Technician, 5th Grade, Germany, 1946-47; A.B., Harvard College, 1950; M.D., Harvard Medical School, 1954; married; home: Boston, Massachusetts.

Dr. Arthur E. Baue, Intern in Surgery—born in St. Louis, Missouri, October 7, 1929; A.B., Westminster College, Fulton, Missouri, 1950; M.D., Harvard Medical School, 1954; permanent address: St. Charles, Missouri.

Dr. Benjamin D. Canlas, Jr., Assistant Resident in Pathology—born in Bacolor, Pampanga, Philippine Islands, June 27, 1925; A.A., College of Liberal Arts, University of the Philippines, 1946; M.D., College of Medicine, University of the Philippines, 1951; Intern, Philippine General Hospital, Manila, 1951; Instructor in Pathology and Bacteriology, College of Medicine, University of the Philippines, 1951-52; Assistant Resident in Pathology, Maimonides Hospital, Brooklyn, N. Y., 1952-54; permanent address: Bacolor, Pampanga, Philippine Islands.

Dr. David L. Collins, Jr., Intern in Surgery—born in South Boston, Virginia, August 22, 1928; B.S., University of North Carolina, 1951; 2 years at University of North Carolina Medical School; M.D., Harvard Medical School, 1954; home: Wilson, North Carolina.

Dr. Julie S. Crocker, Assistant Resident in Anesthesia—born in Detroit, Michigan, October 5, 1927; A.B., Vassar College, 1948; M.A., Columbia University, 1949; M.D., College of Physicians and Surgeons, Columbia University, 1953; Intern, Mary Hitchcock Memorial Hospital, Hanover, New Hampshire, 1953-54; married; home: Jamaica Plain, Massachusetts.

Dr. Gerald M. Edelman, Intern in Medicine—born in New York City, July 1, 1929; B.S., Ursinus College, Collegeville, Pennsylvania, 1950; M.D., University of Pennsylvania, 1954; married; home: Long Beach, N. Y.

Dr. James A. Flagg, Assistant Resident in Anesthesia—born in New York City, June 29, 1924; Fordham Preparatory School, 1938-42; Fordham University, 1942-43; Cornell University, 1943-44; Columbia Midshipman School, July-October 1944; U.S. Navy: Ensign, LST 826, Pacific Theatre, including Iwo Jima, Okinawa, and Japan, 1944-46; M.D., Temple University School of Medicine, 1951; Intern, U.S. Naval Hospital, St. Albans, N. Y., 1951-52; Aviation School of Medicine, July-December 1952; Flight Surgeon with the U.S. Marines at Cherry Point, North Carolina, 1953-54.

Dr. Philip S. Gordon, Intern in Dentistry—born in New Haven, Connecticut, March 17, 1926; U.S. Army: Air Force, 1944-45; A.B., Yale University, 1948; D.M.D., Harvard School of Dental Medicine, 1954; married; one son; temporary home: Boston, Massachusetts.

Dr. Gilbert Hermann, Intern in Surgery—born in Jersey City, New Jersey, May 1, 1929; A.B., Columbia University, 1950; M.D., Washington University, St. Louis, Missouri, 1954; home: North Bergen, New Jersey.

Dr. Fleming McConnell, Assistant Resident in Radiology—born in Winnipeg, Manitoba, Canada, September 13, 1925; military service: Lance Corporal, Royal Canadian Armored Corps, in England, Holland, and Germany, 1944-46; B.A., University of British Columbia, Vancouver, Canada, 1948; M.D., University of Toronto, 1952; Intern, Toronto General Hospital, 1952-53; Senior Intern in Medicine, Shaughnessy Military Hospital, Vancouver, 1953; home: Vancouver, British Columbia, Canada.

Dr. Norman Trieger, Intern in Oral Surgery—born in New York City, March 3, 1929; New York University, 1945-46 and 1947-48; A.B., Emory University, Emory, Georgia, 1950; D.M.D., Harvard School of Dental Medicine, 1954; married.

Dr. Henry deF. Webster, Assistant Resident in Neurology—born in New York City, April 22, 1927; Amherst College, 1944-45; U.S. Navy: Pharmacist's Mate 3d Class, St. Albans Hospital, 1945-46; B.A., Amherst College, 1948; M.D., Harvard Medical School, 1952; Intern and Assistant Resident in Medicine, Boston City Hospital, 1952-54; married; one child; home: Wellesley Hills, Massachusetts.

Dr. Ralph C. Williams, Jr., Intern in Medicine—born in Washington, D. C., February

17, 1928; A.B., Cornell University, 1950; M.D., Cornell University Medical College, 1954; married; one daughter, one son; home: Chevy Chase, Maryland.

Dr. Alexander L. Zaoussis, Assistant Resident in Orthopedic Surgery—born in Athens, Greece, April 13, 1923; M.D., Medical School, Athens University, 1948; Intern and Assistant Resident in General Surgery, Hellenic Red Cross Hospital, Athens, 1948-50; Ph.D., for thesis in General Surgery, Medical School, Athens University, 1951; Army Service: Member of the Greek Resistance Movement against German Occupation Forces, 1941-43; Liaison to National Democratic Guerrilla Army, 1944; captured by Communist Guerrilla Forces, August 1944; 2d Lieutenant, M.C., Regular Greek Army, 8th Mountaineer Infantry Division in north and northwestern Greece and Chief Resident for 3 years in the Fracture Service, 430th Military Hospital, Athens, 1950-53; unmarried; home: Athens, Greece.

New addresses:—

Dr. Betty Q. Banker (a.r.p. *N.P.* 1954), Grace-New Haven Community Hospital, New Haven, Conn.
Dr. Charles G. Barnett (*M.* 1954), 2506 Green St., San Francisco, Calif.
Dr. Stanley Berlow (*C.M.* 1951), 1513 East Capitol Drive, Milwaukee, Wis.
Dr. Lester J. Bienvenu (a.r.p. *D.* 1951), 1426 Elm St., Manchester, N.H.
Dr. Harvey E. Billig, Jr. (*Or.* 1935), Billig Clinic, 139 South Alvarado St., Los Angeles 4, Calif.
Dr. John T. Binion (*M.* 1953), National Institute of Health, Bethesda, Md.
Dr. Lemuel Bowden (*E.S.* 1941), 863 Park Ave., New York 21, N.Y.
Dr. Robert A. Broome, Jr. (*M.* 1944), 3 West Columbia St., Orlando, Fla.
Dr. Crawford S. Brown (a.r.p. *D.* 1952), Department of Dermatology, Hospital of the University of Pennsylvania, 36th and Spruce Sts., Philadelphia 4, Pa.
Dr. Lloyd T. Brown (*S.S.* 1908), Murray Lane, Harvard, Mass.
Dr. Roy L. Byrnes (a.r.p. *Path.* 1954), Memorial Hospital, 444 East 68th St., New York, N.Y.
Dr. Joseph F. Ciano (*Dn.* 1954), 61 Fairmont St., Dorchester, Mass.
Dr. William D. Cochran (a.r.p. *C.M.* 1954), Children's Medical Center, Boston, Mass.
Dr. Paul Colokathis (a.r.s. *Or.* 1954), 967 Elm St., Manchester, N.H.
Dr. E. Stanley Crawford (*E.S.* 1947), Baylor University College of Medicine, Texas Medical Center, Houston, Tex.
Dr. Ralph C. Darling, Jr. (*C.M.* 1954), Children's Medical Center, Boston, Mass.
Dr. Fa-Chi Dunn (a.r.p. *D.* 1954), 45 Napier Ave., Oakland, Calif.
Dr. Kenneth A. Evelyn (clin. fel. *M.* 1947), British Columbia Medical Research Institute, 755 West 12th St., Vancouver 9, British Columbia, Canada
Dr. James B. Field (*M.* 1952), National Institute of Arthritic and Metabolic Diseases, National Institute of Health, Bethesda, Md.
Dr. Knox H. Finley (*W.M.* 1934), 450 Sutter St., San Francisco 8, Calif.
Dr. Carl W. Gottschalk (*M.* 1946), Department of Medicine, University of North Carolina, Chapel Hill, N.C.
Dr. Sigurd B. Gundersen, Jr. (*S.* 1949), 218 South 14th St., LaCrosse, Wis.
Dr. Parker Heath, Jr. (a.r.p. 1954), Rockland, Maine
Dr. Robert B. Higgins (a.r.s. *U.* 1951), 148 Shelbourne Towers, Knoxville, Tenn.

Col. Milton S. Thompson, MC, USA (*Or.* 1934), U.S. Army Hospital, Neubrucke, APO 34, c/o Postmaster, New York, N.Y.
Dr. Jerome K. Walker (*Dn.* 1954), 2161 Massachusetts Ave., Cambridge, Mass.
Dr. Weldon W. West (*S.* 1948), 3130 North Eldorado St., Stockton, Calif.
Dr. J. Garland Wood (clin. fel. *R.* 1950), Radiology Department, Medical College of Alabama, Birmingham, Ala.
Dr. Henry F. Zartman (*C.M.* 1954), Boston City Hospital, Boston, Mass.

Brief bits:—

Dr. Henry H. Brewster, who resigned from our Psychiatry staff on June 30, is Assistant Professor of Psychiatry at the Lakeside Hospital and Western Reserve Medical School in Cleveland, Ohio.

Dr. Benjamin Castleman conducted an all-day Pathology Slide Seminar on June 8, before the Minnesota Society of Clinical Pathologists in Duluth.

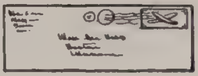
Dr. Robert H. Fennell, Jr. resigned from our Pathology Staff on June 30, to become Associate Pathologist at the Magee Hospital in Pittsburgh, Pennsylvania, and Assistant Professor of Pathology at the University of Pittsburgh School of Medicine. He wishes Magee Hospital used for his mailing address.

Dr. Francis M. Ingersoll attended the meeting of the American Society for the Study of Sterility, in San Francisco, June 18-20, and presented data from the Vincent Laboratory on the urinary excretion of interstitial cell stimulating hormone (ICSH) in normal and anovulatory women.

Dr. Robert R. Linton was made President of the Society for Vascular Surgery, at the meeting of the Society held in San Francisco on June 20.

Dr. Frank B. Norbury (*M.* 1949) announces the opening of his office for the practice of Internal Medicine, at 401 Farmers' Bank Building, Jacksonville, Illinois.

Dr. John W. Smillie (*E.S.* 1944) has been appointed Assistant Professor of Ophthalmology at the University of Michigan Medical School, Ann Arbor, Michigan.



This letter has come from another "singleton"—Dr. Arthur B. Emmons, II (*W.S.* 1905):

> Yours of July 9 made me stop and think, not because I am the only MGH man in this area, but—
>
> While I was working as an intern in the O.P.D. (Gyn.) at Massachusetts General, my right eye became infected. Eventually the sight in that eye was lost. Since then I have had a long and varied career, some of it not even medical. My last job was in Public Health work during World War II. Now I am retired (age 79), living in Indian Rocks, Florida, with my wife (2d), in a new and comfortable house.
>
> About three months ago an occulist told me that my left (good) eye had a beginning cataract. One of my good friends, a dentist, is now practising Body Chemistry. He has taken me on as a patient. I still have good eyesight, drive my car, and do not notice any impairment of sight. I am convinced he can clear up my cataract, as he has done for others. My diet is largely protein, to reduce calcium and increase phosphorus in the blood.
>
> So life goes on smoothly in this pleasant land. We may make an automobile trip north in September. I shall drive most of the way.

Another "singleton" has responded to our request for news. Dr. Mary S. (Blakely) Fisher (*M.* 1949) writes from 127 B Wallworth Park, Haddonfield, New Jersey:

> Your letter addressed to me in Elkins Park recently reached me at the above address, to which I moved in July. I do not know whether I am a "singleton" in Haddonfield, also [She is.—*Editor*], but as both towns are in the category of suburbs of Philadelphia I don't think there is anything unique in the local medical situation.
>
> I am an Assistant Radiologist at the Philadelphia Veterans Hospital, working part time. The rest of my time (and there is never enough) is occupied by two small children. The younger is ten months old. They comprise my special interest, along with the other usual occupations of the suburban housewife.
>
> I always enjoy THE NEWS.

We were very glad to receive this letter from Dr. Avrum B. Organick (*M.* 1952):

> Somewhat guiltily now, almost a year after leaving the General, I submit a check for a subscription to THE NEWS. My new job will take me far afield and I shall be anxious to hear from home.
>
> I began my new job on July 1 as Director of Tuberculosis at Fort Defiance Sanitarium, Fort Defiance, Arizona. This is on the Navajo-Hopi Reservation, where tuberculosis is a major problem. I shall have the privilege of working in cooperation with Drs. Carl Muschenheim and Walsh McDermott from the New York Hospital-Cornell Medical Center in problems of antituberculosis chemotherapy.
>
> In one week, on a short visit to Fort Defiance last March, I was impressed with a great variety of new experiences—medical, geographical, and social—concerning the Navajo. At some later time I should like to report to you on some of these experiences.

Dr. George D. Parker (*Dn.* 1939) has moved from Monte Vista to 5528 East 33d Avenue, Denver, Colorado. This interesting letter has come from him:

> I am sorry to lose the distinction of being a "singleton", but recently I set up an office

No. 51 in a series of Staff photographs
Dr. Wyland F. Leadbetter — newly appointed Chief of Urology Service

in Denver.

Monte Vista, situated in the tremendous San Luis Valley (as large as Connecticut) and surrounded by mountains, is one of the most beautiful areas I have seen in the United States. Nevertheless, there are many disadvantages associated with a small town which were nonconforming to Mrs. Parker and me, who are used to larger metropolitan areas. Denver is presently enjoying a tremendous boom, especially in construction.

I am very interested at this time in dental implants (vitallium). Last year I developed a new type of apical implant which is on the market. The August *Dental Digest* and September *Oral Hygiene* are running advertisements on it. Also, I attended the first university-sponsored study on implant dentures at Emory University, Atlanta, Georgia, last March. Dental implants are as yet highly controversial subjects to mention, but so was chlorinated water when it first came out!

This very nice letter has come from Dr. Hervey L. Smith (*W.M.* 1907)—our "singleton" in Palm Beach, Florida:

Yes, you are right. As far as I know, I am the only MGH-er in the town of Palm Beach.

As for special interests—I doubt if I have any. I do what I want to do and what I feel like doing, and time never hangs heavy. I winter in the South where I have a nice home, and summer in the North with relatives. I feel that the shift back and forth is beneficial.

I retired in 1939 and have not done a stroke of practice since. I do take the medical journals and I read them as much as ever, as I now have the time for so doing.

Palm Beach is a lovely town on an island nine miles long and a quarter of a mile wide. Three bridges connect it with the mainland. The town is beautifully laid out. It was established by northern millionaires before the days of income taxes. Now, for the most part, they have gone, but what they did lives after them.

The cost of living here is no greater than in the North. We have no State income taxes. We have no inheritance taxes. The first five thousand on real estate is exempt (Homestead), and valuations are low. Our summers are long and warm, but the temperature never equals what you have in the North. My complaint about summer is that it's just too long.

Florida is on the move, and the population is increasing rapidly. The colored people are trekking north, the whites of the North are heading south, cotton is working west across the Mississippi, and Texas cattle are coming east. This means changes, but "The Land of Flowers" will go on.

My best wishes to the MGH family. I graduated in 1907, so the family as I knew it is greatly changed. However, I am glad to know that a new personality carries on.

It is always good to hear from our men in military service. This letter has come from Lt. William A. Tisdale, MC, USAR (*M.* 1952), written on July 30 from the 121st Evacuation Hospital, APO 971, c/o Postmaster, San Francisco:

Many thanks for your faithful dispatching of The News! It and S. S. Pierce pipe tobacco continue to be my strongest Boston bonds.

After nine months of brain-washing in a separate medical battalion in Chong-pyong-ni, I was transferred to the 121st Evacuation Hospital in Seoul about three months ago. The hospital has 400 beds (no bassinets), some adequate consultants, and the general atmosphere of the MGH Medical Clinic on Monday mornings. We see a lot of infectious diseases, some oriental enigmas, and the usual forms of neurosis.

My Regular Army friends assure me this is a great experience. Returning to the M.G.H. is my fondest dream.

This very welcome note has come from Lt. Giles D. Toll, MC, USNR (*S.* 1952). His present address is U.S.S. *St. Paul* (CA 73), c/o Fleet Post Office, San Francisco.

It's a pleasure to renew my subscription to The News, which is a consistent source of interest and enjoyment.

The Navy continues to be very considerate in its assignments. After starting off the year with a trip around Cape Horn, I was fortunate in landing a billet on the *St. Paul,* which is presently operating in the vicinity of Japan, with her home port in Yokosuka. While the cruise is proving to be most interesting, it has unfortunately been devoid of a reunion with any MGH colleagues. Consequently, I am sorry not to have any items of particular interest for The News.

Warmest greetings to everyone at the Old Massachusetts.

Every MGH-er—old or young—will enjoy what Dr. J. Edwin Wood, Jr. (*W.M.* 1923) says in this letter, written from the School of Medicine, University of Virginia, Charlottesville, Virginia:

I did not realize that we had been so delinquent in our news items from this section of the country. We have quite a number of Massachusetts General house officers in this region.

I have one amusing story which is quite a commentary on the Massachusetts General Hospital, and I am sure it will be amusing to you.

Some months ago I was very anxious to get in touch with my son, Dr. J. Edwin Wood, III, who graduated from Harvard some five years ago and was at that time Medical Resident at the Evans Memorial with Dr. Chester Keefer. In the course of the long distance call, in some way the Massachusetts General got on the line and the operator asked for Dr. J. Edwin Wood. This was, of course, a mistake. We should have called the Massachusetts Memorial Hospitals. However, in a very few minutes the operator said that Dr. Edwin Wood had been a house officer at the Massachusetts General Hospital, but had not been there since 1923. I soon realized what the trouble was and had the call changed to the Massachusetts Memorial. However, the incident impressed me a great deal, as I am sure our own hospital and many other hospitals would not be able to turn to an index and in a few minutes name a house officer that had not been in the hospital for 31 years! The matter touched me considerably, as I did not realize that anyone would remember or even have a record of my previous connection with the institution.

Perhaps there are others besides Dr. Wood who do not realize that in our Archives Department we have the complete record of the service of every doctor associated with Massachusetts General from the time of the first Hospital Staff in 1821 up to and including the very last appointment made by the Trustees or the General Executive Committee.

THE NEWS

No. 138 Boston, Mass. October 1954

A HOSPITAL RESEARCH PROGRAM

EXPERIENCE AT MASSACHUSETTS GENERAL HOSPITAL

Developing a research program centered in a general teaching hospital is a stimulating and, at times, trying task. The first questions one is likely to be asked in this connection are, "Why do it at all? Can't research be done adequately in the laboratories of the medical school or of the pharmaceutical industry? Is it really necessary or desirable to have such a program centered in a general hospital?" The answer to these questions is, we feel, that research upon the conditions now of greatest concern to medicine can be done only in connection with a hospital. When medical research was dealing principally with conditions that could be studied satisfactorily in animals, it could be carried on wherever animals could be housed. But the diseases that are today's great plagues—arthritis, cancer, hypertension, heart disease, mental illness, to name a few—seldom naturally occur in animals nor can they easily be reproduced in them in forms comparable to those in which they occur in man. These conditions, therefore, must be studied mostly in man himself in a controlled environment—in other words, in a hospital. In this paper I shall discuss the organizational and administrative features of the research program at the Massachusetts General Hospital rather than its technical content.

In one sense, what we are doing at Massachusetts General should not be called a research "program" at all. By this I mean that it is not in fact a formal program or plan. The Hospital has simply attempted to provide an environment in which research can flourish, in which the members of our staff and of the faculty of medicine at Harvard who are working at the Hospital can work out new ideas, gather associates about them, and proceed to explore the frontiers of knowledge. There is, for example, no Director of Research at the Hospital, and this, we feel, is as it should be. Research done under systematic direction is often useful in the application of new knowledge, but such research is seldom basic in character nor are such arrangements very stimulating to original thought. Again, our attempt is to encourage the individual to develop his own ideas and to help him have an opportunity to carry them out.

Historically speaking, I suppose one can say that research of some sort has been carried on at the Massachusetts General ever since its first unit, the McLean Hospital, was opened in 1818. Careful clinical observation and willingness to experiment have always been manifested here, as they have been in all our major teaching hospitals. The medical literature yields many examples of advances made through the years by the Hospital's staff. But research as one of the prime functions of the Hospital really began in the first two decades of this century, principally under the leadership of Dr. David L. Edsall, for eleven years a Chief of a Medical Service and Professor of Medicine at Harvard Medical School. He encouraged the establishment of research laboratories in 1917 and was instrumental in starting our research or metabolic ward in 1924. Until about the time of the second World War this research was largely financed by Harvard Medical School and was on a rather small scale. Beginning with the move into the Hospital in January 1942 of Harvard's Collis P. Huntington Memorial Laboratories for cancer research, the program began an expansion which was greatly accelerated after the second war.

In 1946, soon after the celebration of the centennial of the first public demonstration of the use of ether for major surgery, the Trustees and staff began an intensified effort to put research at the Hospital on a broader and sounder financial base and to provide adequate physical facilities in which the work could be done. With a great deal of help from the Public Health Service, other government agencies, the Harvard Medical School, a number of foundations, several pharmaceutical houses, and a large number of individual donors, the funds annually available for research at the Hospital have risen from perhaps $350,000 before the war to $2,800,000 in 1953, and a fine new Research Building was completed in 1951 at a cost of about $2,000,000. Incidentally, in connection with our new Pathology Building about to be started, there will be two additional floors for research laboratories. Some 35 different units in the Hospital are now engaged in research of one sort or another.

This, it is easy to see, is representative of a sizeable endeavor. Presumably you will want to know how it is organized and financed, what are the main types of work going on, and what problems may have arisen in connection with it.

As to organization, the Trustees and staff realized after the war that if research was to be expanded and strengthened, something a little different from the usual Hospital services had to be established. A Committee on Research was therefore appointed by the Trustees, consisting of 20 staff members, 4 Trustees, and the Dean of the Medical School. This Committee meets monthly at lunch and reviews matters of general policy, new applications for funds, appointments of new research workers, and so on. It has a half-time, paid secretary, who is himself a research worker the other half of his time, and a non-paid chairman who is elected annually. It also has the necessary secretarial and accounting services at its disposal. In addition, it has the able assistance of the Hospital's full-time Associate Director for Resources and Development, Mr. David C. Crockett—a non-medical associate with primary responsibility for future planning of the Hospital's plant and functions and for fund raising. His duties, however, are by no means limited to matters of research.

It should be made clear that the function of this Committee is not to plan or direct research. It stimulates, guides, coordinates work in the various units, assists staff members to obtain funds from appropriate sources, but does not act as a censor or in any other way interfere with the individual's work. The Committee on Research has an Executive Committee which meets twice in the intervals between meetings of the full Committee and reviews projects and appointments in more detail.

A second important step was also taken by the Trustees—namely, to appoint a Scientific Advisory Committee of distinguished outside scientists. This Committee, on which such outstanding men as the Director of the Rockefeller Institute, the President of Johns Hopkins University, the President of Massachusetts Institute of Technology, the Professor of Biochemistry at Harvard, and a number of others, have sat, meets once a year for two days, reviews all research activities at the Hospital, and reports its findings and recommendations directly to the Trustees. In this way, the Trustees can learn whether the large sums being spent on research are being well used, whether the people doing the work are competent, and whether the work itself is worth while. It has been an exceedingly helpful Committee and its annual meetings are among the year's most stimulating and enjoyable occasions.

Aside from these two committees and their small staffs, there is no formal research organization and we do not feel the need for any. It is our belief, as I have indicated before, that research flourishes best where organization is least, and we have tried to keep the administrative arrangements as simple as possible.

Financing this large amount of research has, as I have mentioned, been done in a number of ways. One of the most interesting of these is the so-called MGH Research Fund. Six or seven years ago it was realized, partly from experience with grants for research projects during the war, that while grants for specific projects were very helpful, they also had serious limitations. For one thing, they are usually for a relatively short period of time—two or three or, at most, five years. Secondly, an idea must almost always be fairly well developed or, indeed, partially proven before it can attract a project grant. Then, too, there is necessarily a good deal of delay between the time an investigator has an idea and the time he obtains a project grant to use for its development. To overcome these difficulties the Trustees and staff raised a fluid fund, amounting to about $100,000 a year, largely by annual gifts from the pharmaceutical industry, which could be used for any research purpose, at the discretion of the Committee on Research and the Trustees. This Fund has proved to be invaluable in getting new investigators started, in providing special training at other institutions for certain investigators, in filling gaps between project grants, in underwriting new projects until outside support could be found for them, and so on.

The MGH Research Fund has seldom been used for any long-term support. An effort is always made to obtain financing from other sources, and on many occasions investigators have been able to return part or all of the allocations received from the Research Fund when other funds became available. It has, in brief, served as a fluid pool, almost a revolving fund, and it has been a godsend, especially to new and unknown investigators trying out new ideas until they have reached a stage of development sufficient to attract outside aid.

Another somewhat similar type of support is a generous annual institutional grant from the American Cancer Society. This, which is $120,000 in the current year, can also be expended largely at the discretion of the Committee on Research and the Trustees for research associated with cancer. The American Cancer Society has put a broad interpretation on its institutional grants and this fund, too, has served as fluid support. Here, again, we have tried not to freeze the fund by committing it to long-term support of the same individuals, but rather to assist investigators in getting started until long-range support can be found from other sources. Incidentally, a goodly share of this institutional grant can be (and is) used to pay for the hospital expenses of cancer patients admitted for purposes of clinical and scientific investigation. The Damon Runyon Fund has also provided a generous institutional grant for cancer research, amounting to about $50,000 a year, and a large share of this has been spent to purchase expensive and delicate research apparatus and equipment.

Aside from these fluid funds and from the generous assistance from the National Institutes of Health in constructing the Research Building, most of the funds for research have been obtained as grants for specific research projects or, occasionally, as grants for the work of a particular investigator.

A number of problems arise in connection with this kind of financing of research. In the first place, most of it is "soft money". If the government should become less interested in financing medical research in outside agencies, if foundation income were seriously reduced, if the Cancer Society and other similar groups failed to obtain sizeable contributions from the public, if the pharmaceutical industry were no longer interested, the bottom would drop right out of it. This, of course, is a hazard not only to the Hospital, but also especially to the investigators and their staffs. It means that offers from other institutions with "hard money" (i.e., endowments) for research are difficult to resist. It could mean an unwarranted strain on the Hospital's general budget if many investigators had to be bailed out at once, even temporarily. For this reason, the Hospital is actively campaigning for an endowment fund specifically earmarked for research and teaching. So far, I regret to say, the results have not been very encouraging.

Another problem produced by this type of financing is that most of the large sources of funds have been established for work in some particular field such as heart disease, cancer, polio, cerebral palsy, multiple sclerosis, and so on. In effect, this fact largely limits the institution to research in these specific fields, and restricts its freedom to roam wherever opportunities seem brightest. To date, this has not been particularly serious for us, largely because of the fluid funds I have mentioned and because of the broad interpretation put on their purposes by most of the agencies, both private and governmental. But it is potentially a danger and has inherent in it the principle, which we think is a bad one, that the donor is directing the investigator as to what his field of interest should be. Even in its present form, it has this effect to some degree because young investigators, pondering the many problems they might tackle, are not unaware that if they go one way, support is almost sure to be forthcoming, while if they go another, even if it appears more promising to them, they may have great difficulty securing funds. This, we feel strongly, is not in the best interests of science. This again points to the need for a "hard money" general endowment for research.

Perhaps the greatest single difficulty, with immediate and very noticeable effect upon the Hospital's operation, is that of obtaining sufficient funds to pay for the indirect costs of research. When a Chief of Service has a small laboratory with a few Bunsen burners and microscopes and one technician off behind his office somewhere, that isn't much of a problem. But when you have a 7-story building 45′ x 100′ to heat, light, clean, and maintain, an annual budget of $2,000,000 to collect and disburse, and 163 people to pay, it is something else again. What are the true indirect costs of medical research? Of course, they vary from project to project but, working closely with the Harvard Medical School and its other affiliated hospitals, we have come to the conclusion that they are, on the average, at least 25 percent of the direct costs and may well be as high as 35 percent. The 25 percent figure at the M.G.H., incidentally, has been audited and approved by the Atomic Energy Commission. In fact, we are now receiving, on the average, only about 10 percent of the direct costs toward paying for the indirect costs.

You can easily see what this means. It means that the institution has no choice, if it desires (as it does) to continue at full strength its three principal functions of patient care, teaching, and research, but to put its general funds into the support of these indirect costs of research. We see nothing improper in doing this to the extent deemed proper by the Trustees, but we do object to the fact that failure by research-granting agencies to recognize an adequate allowance for indirect costs has seriously restricted the freedom of the Hospital to do what it considers wisest with its own funds. To date, we have deliberately put our funds into such indirect research costs because we believe medical research is so important a function of our Hospital that we are justified in doing so. Perhaps the fact that one of our staff, Harvard Professor Fritz Lipmann, who has been supported principally with funds obtained through the Hospital, shared a Nobel Prize in Medicine in 1953 confirms to some degree the Trustees' wisdom in giving such generous support to research.

But if society wishes to preserve in hospitals, as we believe it should, the three inextricably merged functions that institutions like the Massachusetts General Hospital were designed to serve, and if at the same time society wishes to restore to these institutions, as we also believe it should, a reasonable measure of freedom to decide for themselves the wisest way to use their funds in support of their three functions, then society's research fund-granting agencies must come much closer than they now do to paying for the full indirect costs of research done in hospitals. Not that we feel the Hospital should put no funds into paying for the costs of research, direct and indirect. Far from it. But we feel most emphatically that we should have as much freedom of decision in this matter as we have in others. Incidentally, much the same principles apply to research grants offered to medical schools.

We, together with other similar hospitals and with medical schools, are actively seeking greater recognition by granting agencies of the indirect cost factor in research, and I am pleased to say that these efforts have already had some small success. But we shall have to go much further before we shall be satisfied that the situation is in a healthy balance.

There are numerous other difficulties and points of interest in MGH research activities which one might go into but, as I have said, I shall limit myself largely to matters of policy and administration, and, to that end, will discuss briefly only three more points.

The first of these is, I dare say, common to all institutions in this country in which physicians are engaged in research. It is that, at least until recently, medical education in this country has placed little emphasis upon training students in scientific methodology. As a result, many graduates of medical schools are totally at a loss when it comes to designing an experiment, whether it be a clinical trial of a new drug, the testing of a new surgical procedure, or a laboratory study. This is obviously less true of the basic medical scientists—although it exists even among them—but widespread among clinicians. The Committee on Research has been concerned about this deficiency and last year attempted to attack it by setting up a Therapeutic Trials Panel. This Panel, which includes basic medical scientists and statisticians from Harvard University as well as clinicians from our staff, is available for consultation to any investigator who wishes it. Again, it is not a censor—we believe investigators have to be allowed to make their own mistakes (except where patients are involved)—but gives advice when asked for it. The head of each department is responsible for requiring the members of his department to seek the advice of this Panel whenever he feels it to be desirable. We have not had a long experience with this Panel as yet, but similar plans have been successful elsewhere and our results so far have been encouraging. We are also hoping to make an arrangement with the Department of Pharmacology at Harvard Medical School, under which a pharmacologist from its staff will be assigned to and paid by the Hospital, from the MGH Research Fund, for about one-half of his time, both to carry on research of his own and to assist other investigators in the design of experiments—particularly therapeutic trials of new drugs. Finally, one of the members of the Department of Preventive Medicine at Harvard has offered to give a course on biostatistics at the Hospital, and we hope to arrange for this in a short time.

A question of an entirely different nature has arisen from the fact that certain government agencies have asked members of our staff to engage in classified research work—restricted, confidential, or secret. We believe, along with Harvard Medical School, that to have much classified research going on would be disastrous. It would impede or entirely prevent that free flow of discussion and criticism which is the very essence of science and which characterizes all our research activities at present. It would, moreover, require that certain experiments, possibly hazardous in nature, would be going on, whose character could not be revealed to the Committee on Research or the Trustees, in an institution for which the Trustees and the Corporation are basically responsible. Much of such classified research would certainly be intolerable. At present our policy is that an investigator may undertake classified research only when he is convinced that it is of crucial importance to the national security and when he is uniquely equipped to carry it out—so that if he didn't do it, it probably wouldn't be done at all. With this policy we have only one such project under way.

The requirements of the rather basic biological research now going on at the Hospital for men highly trained in certain scientific disciplines have resulted in the inclusion on our staff of an increasing number of non-clinical investigators: biochemists, physicists, organic chemists, biologists, psychologists, and eventually, as I shall indicate in a moment, probably social scientists as well. This has created a set of problems entirely new for our Hospital and, I dare say, new in the development of medical research. Because the work these men do is often related to patients—we have two full-time physicists, for example, working with our Neurosurgical Service on new methods of localizing brain tumors, one with radioactive isotopes, the other with ultrasonic waves—these scientists are more conveniently located at the Hospital rather than at the Medical School or in the University's basic science departments. But what status should they have at the Hospital, where, until recently, the physician was the unique professional staff member? If they are working at a hospital, what will their standing be in their chosen academic fields of physics, biochemistry, etc.? Will their colleagues at universities recognize them as real contributors in their fields of interest? Who ever heard of a real physicist doing research in a hospital? That these are not laughing matters will be attested by every one of our young non-clinical investigators. For each of them a possibility of future opportunity is obviously essential. If that is to be in a hospital, it is clear that until many hospitals have this type of medical scientist on their staffs, this possibility is very limited. If it is to be in a university or medical school department, the possibility is also limited unless academic institutions recognize work done in a hospital as a legitimate and integral part of the basic field of endeavor. Both of these types of opportunity for non-clinical investigators are extremely limited today, and this poses a serious question for both the hospital and the young investigator.

A beginning of an attack on a part of this problem has been made at the Massachusetts General Hospital. In 1952, on the recommendation of the Scientific Advisory Committee, the Hospital established a rank-scale for non-clinical investigators on the staff equal in status to that of the clinical investigator or of the practising physician. The titles "Biochemist", "Physicist", and so on, have a standing similar in every way to the highest rank on the medical staff—namely, "Physician", or on the surgical staff—namely, "Visiting Surgeon".

There are differences in the situation of the non-clinical investigator and that of the clinician, however, which have nothing to do with the status of an individual. For one thing, the young clinical research worker who does not turn out to be a first-rate investigator and therefore is not invited to remain in that capacity can yet become a successful practitioner of medicine. But the non-M.D. has little to fall back on that is comparable if he does not fulfill his promise as a researcher and is not offered a permanent position on a hospital staff or on a university faculty. Moreover, the number of opportunities for full-time permanent appointments is very different in the two cases. Of perhaps fifty full-time clinical positions at the Hospital, thirteen are positions carrying appointments without limit of time as Harvard professorships or associate professorships, and six others are permanent Hospital appointments. Of about the same number of full-time non-clinical research appointments, only one carries life tenure. Such differences make for restlessness and, ultimately, dissatisfaction on the part of the investigators.

We do not pretend to have reached a solution of these problems. The whole question of collaboration and other relationships between basic science and clinical investigators in a hospital setting is a quite new one, and answers to it will have to evolve as we get more used to the idea. Possibilities for improved academic connections for these workers are being explored, too. Altogether, it is an evolving situation and a somewhat muddy one, but we are conscious of it and are attempting to find constructive means for dealing with it.

Before closing, I should like to say a word about prospects for research in the future which have a deep interest for me, personally. In connection with the development of our Family Health Service—a comprehensive home, clinic, and in-patient service similar in many respects to the well-known one at Montefiore Hospital in New York—which will, we hope, be in reasonably full operation within a year, and which will serve many families in our neighborhood, we confidently count on the collaboration of the Harvard School of Public Health, as well as the Medical School, and of the various units of the Behavioral Sciences at Harvard University, and perhaps of other institutions, in extensive long-term studies of the intricate and as yet unresolved questions of the role of the socio-economic environment in health and illness, perhaps that of genetic factors also, and certainly of psychological and emotional factors. These will hardly be elucidated in a day; yet they are research problems peculiarly appropriate to a general hospital which serves, as does the Massachusetts General, not only as a significant research and teaching institution known in many parts of the world, but also very actively as the community general hospital for the population of a large part of the City of Boston. In our zeal for "scientific" discoveries in the laboratory, we shall certainly not forget our historic and primary mission: to be a center of health services for people. We are enlarging that mission to study our people (as well as our services) in order to serve our people more effectively. That, ultimately, must be the proper goal of any research program in a general hospital, and it is ours.

Dean A. Clark, M.D.,
General Director

Paper read at a joint session of the American Association for the Advancement of Science and the American Association of Hospital Consultants, Boston, Massachusetts, December 30, 1953.

* * *

Dr. Joe V. Meigs, with a group of members of the American Gynecological Club, attended clinics throughout England, Ireland, and Scotland during the summer. While in Scotland, Dr. Meigs was given an Honorary Fellowship in the Royal College of Surgeons in Edinburgh, and while in London, an Honorary Fellowship in the Royal College of Obstetricians and Gynecologists. He also attended the International Congress of Obstetricians and Gynecologists in Geneva, and visited with Dr. Ernst Navratil in Graz, Austria.

Before going to Europe, Dr. Meigs was given an Honorary Fellowship in the Swedish Medical Society.

While lecturing at the University of Buenos Aires, Dr. Henry K. Beecher was made an Honorary Member of the Argentine Society for Thoracic Surgery.

Mrs. Ruth M. Graham, in charge of the Cytology Laboratory of the Vincent Memorial Hospital, was awarded an honorary degree of Doctor of Science by the Women's Medical College in Philadelphia in June.

On June 20, at the annual meeting of the American Gastroscopic Society held in San Francisco, Dr. Edward B. Benedict was the recipient of the first Rudolf Schindler Award for advancing the gastroscopic procedure.

Dr. Schindler, who made the presentation at the Society's banquet at the Mark Hopkins Hotel, paid tribute to Dr. Benedict as the man who was the first to use the flexible gastroscope, independently, in this country; who has published so many excellent and extremely critical articles on gastroscopic subjects; who was the first to demonstrate and to emphasize the frequency of gross hemorrhage from gastritis; who published an excellent book on endoscopic methods; and who is the originator of the operating gastroscope—a contribution of very great importance.

Dr. Benedict's response was as follows:

> I am naturally very much pleased and honored to be the first recipient of the Rudolf Schindler Award for the advancement of the gastroscopic procedure. I want to thank the American Gastroscopic Society for so generously offering this Award and also to express my appreciation to the special committee of this Society for selecting me for this signal honor.
>
> As you all know, Dr. Schindler's career is a very distinguished one—teacher, author, and inventor. After receiving numerous honors in Germany and writing a German textbook on Gastroscopy, Dr. Schindler came to this country in 1934, where he became Visiting Professor of Medicine from 1934 through 1936 and Associate Professor of Medicine from 1937 to 1943 at Billings Hospital, University of Chicago. Since 1943 he has been Clinical Professor of Medicine at the College of Medical Evangelists in Los Angeles. In 1937 he published his excellent book on Gastroscopy, a new revised edition of which was published in 1950. In 1947 his monumental work on Gastritis was published. Dr. Schindler is also famous as the inventor of a rigid gastroscope in 1923, the Wolf-Schindler flexible gastroscope in 1932, and an optical diagnostic esophagoscope in 1948. In 1936 he received the Gold Medal Award of the American Medical Association, and last, but not least, in 1942 he was the founder and first President of the American Gastroscopic Society.
>
> I would like to say just a few words regarding Dr. Schindler's influence on my medical career. I was surgically trained at the Massachusetts General Hospital and spent a number of years in the active, or perhaps *in*active, practice of surgery. I had hoped to do gastric surgery, and actually did *one* subtotal gastrectomy! My chief interest was the stomach, and I was lucky enough to mention to Dr. Chester Jones in 1932 that we ought to have a method of direct endoscopic examination of the stomach. He agreed, but we both felt that rigid gastroscopes were probably too dangerous. However, I was lucky again, for in only a few weeks Dr. Jones told me the Carl-Zeiss Company agent had come to him asking that a trial be made of the new Wolf-Schindler flexible gastroscope. Dr. Jones and I tried it out together, with the aid of an ENT man, Dr. Charles Johnson. As luck would have it, our first patient was a man who was later proved to have a gastric lymphoma! We did not make the diagnosis, needless to say, on our first gastroscopic attempt. In fact, I believe we could do it now *only* with gastroscopic biopsy. Anyway, from then on my work in gastroscopy was started. Dr. Churchill suggested that I add bronchoscopy and esophagoscopy, and Dr. Allen suggested peritoneoscopy, too, so I gave up general surgery altogether and have devoted myself entirely to endoscopy. I have never regretted this change in my medical activities. I want to make it clear, however, that I owe ever so much to the stimulation and support of my colleagues at the Massachusetts General Hospital and the Harvard Medical School.
>
> Again, I want to thank the American Gastroscopic Society and Dr. Schindler, not only for this Award, but also for what I feel has been a very fortunate change in my life work.

The Board of Trustees, at their meeting on August 20, voted:

To grant Dr. Walter Bauer three weeks' leave of absence, effective in October;

To grant Dr. Allan M. Butler leave of absence for six months, effective October 1.

To reappoint:

Dr. Richard H. Eppright, who has been in the Navy, as Assistant Resident in Orthopedic Surgery, effective October 15.

To appoint:

Dr. Mahlon B. Hoagland as Assistant to the General Director for Research and Education, effective on Dr. Berg's resignation;

Dr. Charles V. duB. Lovell as Clinical Associate in Psychiatry, effective September 1;

Dr. Joseph J. M. McGovern as Assistant to the Children's Medical Service, effective August 1;

Dr. Donald P. Pederson as Assistant Resident in Anesthesia, beginning April 1, 1955.

At their meetings on August 18 and September 8, the General Executive Committee voted:

To grant Dr. Allan St. John Dixon leave of absence from his position as Clinical and Research Fellow in Medicine, for the period September 1 through October 31.

To promote:

Dr. James L. Vanderveen to the position of Chief Resident in Anesthesia, as of September 1.

To reappoint:

Theodore O. Macklin, A.B. as Research Fellow in Psychology for one year, beginning July 1;

Dr. Jorge M. Martin as Clinical and Research Fellow in Medicine for one year, beginning September 9;

Dr. Nancy Rollins as Clinical Fellow in Psychiatry for one year, beginning July 1;

Dr. Howard M. Spiro as Clinical and Research Fellow in Medicine for one year, beginning September 1;

Dr. Albert Van Eerde as Assistant Resident in Anesthesia for one year, beginning October 5.

To appoint:

Dr. William H. Batchelor as Clinical and Research Fellow in Medicine, beginning September 1;

Dr. Roger L. Black as Clinical Fellow in Medicine, for the period February 1, 1955 through March 31, 1955;

Dr. Walter C. Cotter as Clinical and Research Fellow in Neurosurgery, for the period August 1 through December 31;

Dr. Willy Hijmans as Clinical and Research Fellow in Medicine for one year, beginning January 1, 1955;

Dr. William H. Horwitz as Clinical Fellow in Psychiatry, effective September 1;

Dr. Roger A. Melick as Clinical and Research Fellow in Medicine, effective September 15;

Dr. Walter S. Michel as Research Associate in Physics (Medicine) for one year, beginning September 1;

Dr. Gisela A. Munzinger as Clinical Fellow in Psychiatry, effective as of July 1;

Dr. Edward S. Rendall as Clinical Fellow in Medicine, effective as of August 1;

Werner Ritschard, Ph.D. as Research Fellow in Biochemistry (Medicine) for one year, beginning October 1;

Gene M. Smith, Ph.D. as Research Fellow in Psychology, beginning September 1;

Dr. Ernest A. Sneddon as Fellow in Anesthesia, effective as of August 15.

* * *

Dr. Frederick S. Tomchik, First Assistant Resident in Radiology, is in Oak Ridge, Tennessee, where he is studying the techniques of using radioisotopes. Dr. Tomchik is one of 32 scientists and physicians from throughout the United States who are enrolled in a four-week course being conducted by the Oak Ridge Institute of Nuclear Studies—a non-profit educational corporation of 32 universities in the South. The course includes a study of radiation-measuring instruments, the nature and theory of radiation, statistical problems in radiation measurements, and the techniques of working safely and effectively with radioisotopes.

Following the completion of the course, Dr. Tomchik will be associated for two months with the isotope research hospital unit of the Oak Ridge Institute.

STAFF PUBLICATIONS

Titles of the latest publications by members of the Massachusetts General Hospital and the Massachusetts Eye and Ear Infirmary staffs, as received in the office of The News, appear each month in this column. The purpose of this listing is to report, month by month and as soon as possible, the titles of all articles or books written by our staff members, so that our readers may keep up to date on current Massachusetts General and Eye and Ear literature. This purpose is defeated when authors or departments postpone the reporting of titles. Therefore, we ask that you send *promptly* all titles of your latest publications to Cora F. Holbrook, Editor of THE NEWS, together with 1) *classification of material,* 2) title of article, 3) title of publication in which it appears, together with the volume and page numbers. For books, give the publisher's name and address.

PLEASE REMEMBER TO INCLUDE THAT CLASSIFICATION. It causes your editor considerable unnecessary time and trouble when you fail to include it. Your title should be classified with respect to the subject matter and not under the hospital department with which you are affiliated. As an illustration—an article written by a member of the Children's Medical Service may concern a problem in General Medicine, Anesthesia, or Laboratory Science.

The following new titles have been received:

Allergy

Burrage, W. S., and Irwin, J. W.
Cortisone and hydrocortisone in the treatment of allergic diseases.
Rhode Island M. J. 37:371-374, 381.

Anesthesia

Beecher, H. K., and Todd, D. P.
A study of the deaths associated with anesthesia and surgery.
Ann. Surg. 140:2-34.

Eisenman, G., and Rudin, D. O.
The compound origin of potential in a stimulated dorsal root.
J. Gen. Physiol. 37:781-793.

Rudin, D. O., and Eisenman, G.
On the role of the spinal afferent neuron as a generator of extracellular current.
J. Gen. Physiol. 37:795-812.

Cardiology

Sprague, H. B., and Hardy, H. L.
An unusual case of joint pains and fever: Berylliosis and pulmonary hypertension mistaken for rheumatic fever.
Circulation 10:129-132.

General Surgery

Waddell, W. R., Sniffen, R. C., and Whytehead, L. L.
The etiology of chronic interstitial pneumonitis associated with lipid deposition: An experimental study.
J. Thoracic Surg. 28:134-144.

Waddell, W. R., Sniffen, R. C., and Whytehead, L. L.
Influence of blood lipid levels on inflammatory response in lung and muscle.
Am. J. Path. 30:757-769.

Laboratory Science

Schmid, K.
The N-terminal residue in acid glycoprotein.
Biochim. et Biophys. Acta 14:437.

Neurology, Neurosurgery, and Psychiatry

Brown, T., Nemiah, J. C., Barr, J. S., and Barry, H., Jr.
Psychologic factors in low-back pain.
New England J. Med. 251:123-128.

Orthopedic Surgery

Brown, T., Nemiah, J. C., Barr, J. S., and Barry, H., Jr.
Psychologic factors in low-back pain.
New England J. Med. 251:123-128.

Physiology

Herbst, F. S. M., and Hurley, N. A.
Effects of heparin on alimentary hyperlipemia: An electrophoretic study.
J. Clin. Investigation 33:907-911.

Surgery—Thoracic

Scannell, J. G., and Shaw, R. S.
Surgical reconstruction of the superior vena cava.
J. Thoracic Surg. 28:163-174.

* * *

CHILD PSYCHIATRY UNIT

Children have received psychotherapy in the Psychiatry Department of the Massachusetts General Hospital since 1934. In September 1947, a unit for Child Psychiatry was established through the efforts of Drs. Stanley Cobb and Allan M. Butler, who obtained U.S.P.H.S. funds allocated for training and research.

Although these two pursuits are the primary concern of the Unit, financial support from other sources has now made it possible to provide independent psychiatric treatment of children; the Unit is a part of the Department of Psychiatry of the Massachusetts General.

The child psychiatry team consists of two full-time and six part-time psychiatrists, six fellows in psychiatry, four part-time psychologists, two graduate students in psychology, three staff social workers, and three social service students.

For the first few months of operation we had no official working space, but we took advantage of vacant offices where we could find them and gradually acquired "squatters' rights". When the Burnham-Vincent Building was completed in 1948, Dr. Butler let us use some rooms on Burnham 5 and 6, and, during off hours, in the Children's Medical O.P.D. In October 1953, thanks to the Hyams Fund and the M.G.H., a large portion of the uncompleted 7th floor of the Burnham Building was roofed in and converted into a permanent home for the Unit. This gave a big boost to our morale, brought us all together, and made it possible for us to cooperate more closely and to confer informally together more easily—important factors in effective psychiatric team work. Our Unit consists of offices, playrooms, and a conference room with a library containing publications on embryonics. We also have an observation room with one-way screens, permitting simultaneous observation of a play-therapy interview with a child in one room and an interview between mother and social worker in the other.

Patients are also seen in consultation on the wards, on request of the Pediatric Service, and some are taken into psychotherapy. Child psychiatrists are invited to participate in Pediatric Rounds, and joint discussions are held concerning cases of interest to both Services. Lectures and "clinics" are held from time to time as part of the Nurses' Training Program.

At present, emotionally disturbed children needing hospitalization for psychiatric reasons are admitted on the pediatric wards. Thanks to the understanding attitude of the pediatric house staff and nurses, this has worked out very well, but it has meant excluding from treatment highly disturbed children who require special care. We hope for a ward for such patients in the future.

The following table gives an idea of the service rendered by the Unit:

January 1 through December 31, 1953

Total number of interviews	7734
Intake applications	284
Cases seen for consultation and diagnostic study	199
Cases seen for psychological testing	65
New cases accepted for treatment	120
Total number of treatment cases	211

Waiting period: 3 to 6 months

In the usual course of events, a patient comes into treatment in the following manner: Peter X is taken to the Children's Medical O.P.D. because his mother is worried about his poor appetite, weight loss, temper tantrums, and nightmares during convalescence from atypical pneumonia. He is referred to Child Psychiatry, where the mother is interviewed by a social worker to get preliminary medical and social information. The case is discussed at Intake Conference, where it is felt that further information should be obtained by diagnostic interviews between Peter and a doctor and by psychological testing. The case is discussed again at a subsequent conference a few weeks later, at which time it is felt that the symptoms indicate a fairly serious emotional disturbance and not merely the expected psychological reaction to illness; this decision is based on the results of the psychological tests, play interviews, and additional social history. Therefore, Peter is accepted for eventual psychotherapy and placed on the waiting list. When the proper time comes, Peter begins treatment with a doctor and his mother gains help in understanding his problems, and her own in relation to his illness, through simultaneous interviews with a social worker.

Most of our cases fall into the following categories: Disturbances of development and adaptation (such as feeding difficulties, enuresis, constipation, learning problems); psychosomatic illnesses (asthma, eczema, rheumatoid arthritis, ulcerative colitis, etc.); psychoneurosis and psychoses. Since we give preference to referrals from within the Hospital, the majority of our cases have physical complaints, or what their parents consider are medical problems. In contrast to the type of cases most often seen by Child Guidance Clinics, we treat many children whose emotional problems are either secondary to physical disease, or are actual causative factors in their illness.

One of the Unit's most important jobs is the training of psychiatrists, psychologists, and social workers in the special techniques and problems of child psychiatry. This is done through group conferences and presentations (some of them jointly with the Pediatric and adult Psychiatry Departments) and by individual supervision of a trainee by a staff member. Lectures on the theoretical aspects of child development and psychopathology are also presented.

Training cases are selected with a view to providing a well-rounded experience with many different types of problems.

In addition to the fellows in psychiatry, fourth year Harvard Medical School students may spend an elective month with the Child Psychiatry Unit; the emphasis here is on improving the students' observation and evaluation of children's behavior on the wards, rather than training in the techniques of psychotherapy.

Research interest is mainly concerned with psychosomatic problems—the relationship of emotional and organic forces in producing disease. The facilities of the Hospital provide a unique opportunity for the study of children in all physical aspects, and for intensive psychiatric appraisal. The general fields for investigation are as follows:

1) Children's emotional reaction to the stress of illness, operation, hospitalization (events which may be harmful to the child's personality development, but which *can* be constructive and strengthening experiences). In particular, we studied (from 1947 to 1952) the reaction of children to the experience of having their tonsils out at the Eye and Ear Infirmary. This situation was chosen for a starting point because it involved a highly stereotyped condition of short periods of hospitalization and type of threatening procedure. At present we are investigating a more complex problem; children suffering from severe burns are being studied with Dr. Oliver Cope and the Surgical Service. This carries implications of importance in actual clinical treatment; for instance, such patients often suffer from anorexia, and the resultant reduction of caloric intake interferes with healing.

2) Investigation of the ways in which emotional conflicts precipitate, aggravate, or sustain physical illness is currently focused on a group of children with rheumatoid arthritis (in conjunction with Dr. Walter Bauer and the Arthritis Unit), and a group of children suffering from asthma (in conjunction with Dr. Leo Burgin and the Pediatric Staff).

During the past two years we have increased our sharing of mutual interest with other institutions which treat emotional problems of children, such as the Commonwealth of Massachusetts Department of Mental Health and the Metropolitan State Hospital, with attendant sharing of conferences and, to some extent, of fellows and other personnel. The James Jackson Putnam Children's Center, with its emphasis on intensive work with preschool children, proved to be an important complement to our work, and our liaison led last year to an affiliation of the Center with the M.G.H.

With Dr. Erich Lindemann's interest in preventive psychiatry and mental health, plans for the future point to a broadened scope of service in the community, with emphasis on early recognition and treatment of potential emotional disturbances—a program in which psychiatrists work with sociologists, anthropologists, and members of the Harvard School of Public Health.

Lucie Jessner, M.D.,
Head of Child Psychiatry Unit

MASSACHUSETTS EYE & EAR INFIRMARY

Eight members of the Infirmary's ophthalmology staff presented papers at the Seventeenth International Congress of Ophthalmology, held in New York City from September 12 to 17. The papers, on current eye research at the Infirmary, given at the September 14 sessions of the Congress were: "Fixation of corneal grafts", by Dr. Brendan D. Leahey; "The fine structure of the cornea", by Marie A. Jakus, Fellow in Ophthalmology with the Retina Foundation; "Criticisms of the deturgescence theory of corneal transparency", by Dr. David G. Cogan, Director of the Howe Laboratory of Ophthalmology, and V. Everett Kinsey, Ph.D., now of Detroit and formerly on the Howe Laboratory staff; and "Fat formation in the cornea", by Dr. Cogan and Toichiro Kuwabara, Fellow in Ophthalmology with the Howe Laboratory.

On the following day, Dr. Charles L. Schepens discussed "Aspects of the physiology of the vitreous body", and Dr. W. Morton Grant presented a paper on "Outflow of the intraocular fluid: Experimental aspects", as prepared by him and Dr. Robert R. Trotter, both of the Howe staff.

Dr. Grant had previously taken part in a glaucoma symposium at the opening sessions of the Congress, held in Montreal from September 9 to 11.

At a recent meeting in San Francisco, Dr. Trygve Gundersen was elected Chief of the Section of Ophthalmology of the American Medical Association. He had acted as Secretary for the past six years.

At the same meeting, Mr. John T. Murphy, Chief Pharmacist, presented a paper written in collaboration with Dr. Henry F. Allen of the Ophthalmic staff, and Miss Anita Mangiaracine, Bacteriologist, entitled "Preparation, preservation, and sterilization of ophthalmic solutions".

The American Board of Otolaryngology examinations were held in New York City during the week of September 13. The Eye and Ear Infirmary was represented by Dr. LeRoy A. Schall, Chief of Otolaryngology, Dr. Philip E. Meltzer, Surgeon in Charge of the Winthrop Foundation and Clinic for the Deaf, and Dr. Werner Mueller, Director of the Mosher Laboratory, who were present as examiners.

Dr. Schall, Dr. Mueller, and Dr. Meltzer stayed on for the following week to attend the meeting of the American Academy of Ophthalmology and Otolaryngology. Other members of the Infirmary at the meeting included Dr. Donald K. Lewis, Associate Surgeon with the Winthrop Foundation, Dr. George Kelemen, Research Associate with the Mosher Laboratory, and Dr. George F. Reed, Assistant in Otolaryngology.

ORTHOPTIC CLINIC

Orthoptics is a relatively new branch of ophthalmology in this country. It deals with defective visual habits, defective binocular vision, and defective ocular motility. It is properly defined as the teaching or restoring of single binocular vision by means of graded exercises. Single vision, or fusion, is the ability of the brain to blend two separate images of a single object, seen by each eye simultaneously, into one image, resulting in binocular depth perception or stereopsis.

Orthoptic training can, by no means, be considered a cure-all for strabismus (or more properly, squint), but rather, a part of the treatment, which may include the wearing of glasses and/or surgery on the extra-ocular muscles.

Squint, or strabismus, may be classified as follows: convergent (one eye deviated inward), divergent (one eye deviated outward), or vertical (one eye deviated upward in relation to the other). These may be constant (present at all times), periodic (present at reading distance or when the patient looks at a distance), or intermittent (present only at times, more commonly when the patient is fatigued or under stress). Any squint may be monocular (the same eye always deviating), or alternating (either eye may deviate).

Some squints are present from birth; these are congenital abnormalities. Many become apparent between the ages of eighteen months and four years; these are intermittent at first and then become constant, and are usually due to hyperopia or "far-sightedness". The child is becoming interested in his surroundings, and to obtain a clear image of distant objects he must increase the focus or accommodation of his eyes because he is hyperopic. Accompanied by this increase in focus, he receives a stimulus to converge his eyes, resulting in an over-convergence at distance. As he must increase his focus even more to see clearly at close range, his over-convergence is markedly increased. This type of squint is called accommodative, and is sometimes corrected by the wearing of proper glasses, if they are worn before the squint becomes constant. If the hyperopia is of a small amount, the child may outgrow his far-sightedness and hence his squint. This is infrequent, however.

Some squints may be caused by paresis or paralysis of one or more of the extra-ocular muscles. These may recover in time or may require surgical correction.

The cure of squint may be graded as follows:

1. A cosmetic cure in which the visual axes may be aligned (the eyes straightened with the aid of surgery on the extra-ocular muscles or with glasses), but in which fusion is not present because of

reduced vision in one eye or the fact that the patient never experienced single binocular vision during childhood and hence could not change his visual habits.

2. A functional cure in which the visual axes are aligned with or without the aid of surgery and the patient learns normal visual habits and appreciation of binocular depth perception without the aid of glasses, or with glasses, if there is sufficient refractive error to reduce the visual acuity.

The first aim of orthoptics is improvement of poor vision resulting from nonuse of an eye. This can result from a difference in the refraction of the two eyes, a difference in image-size (aniseikonia) which makes it difficult or impossible for the brain to blend the images from each eye into one clear image. Vision develops during childhood, and if a normal eye is not used during this period, visual development is arrested and will not develop in later life. A constant deviation of one eye produces double vision, even in an infant; the second image is suppressed for comfort, and if this condition persists during early childhood the visual acuity in the deviated eye will remain at the level it had reached when the deviation occurred or actually deteriorate further from disuse. This condition is known as amblyopia ex anopsia (blindness from disuse).

The only effective treatment for amblyopia ex anopsia is complete and constant occlusion of the fixing or dominant eye and use of correcting lenses, if necessary, to force the deviated eye to take up the task of seeing. Occlusion can be carried out at an early age (one year, and occasionally less), and to be effective should be instituted as early as possible. If a child has a constant deviation of one eye he will not "outgrow it", as many parents have been told. The eyes may appear to look better, but if even a small, barely discernible deviation is present during the age of visual development, irreparable damage is done. Therefore, an eye which deviates constantly from birth or even during the first few months of life, if untreated before the age of four or five, may have only blurred form perception. If visual acuity develops to the two-year level and then the deviation occurs (which is common), visual development will be arrested, and if untreated before the age of six or seven will develop no further.

It is most important to test visual acuity in children. This can be done easily at age three by means of picture cards or the illiterate E test. It is possible that a child may have apparently straight eyes, but a high refractive error in one eye may prevent development of normal central vision. Prescription of proper glasses and occlusion should be carried out before school age.

If an infant has an alternating deviation, alternate occlusion prevents development of incorrect visual habits until surgical correction can be undertaken. When the eyes are straight, the orthoptist can attempt to teach correct binocular visual habits.

Another group of patients who benefit from orthoptic training is that group with latent deviation, held in check by fusion. These patients have singular binocular vision under the best of conditions, but fatigue, tension, or illness may so impair the fusion faculty that symptoms of discomfort (usually double vision or blurring) are produced. These people can be taught to improve their visual skills by means of orthoptic exercises (*not muscle exercises*).

When a constant strabismus occurs in infancy or early childhood, surgical intervention is necessary as soon as possible (certainly before school age), as the ability to blend or fuse the images received from each eye is acquired during this time and cannot be learned after the age of seven years. Orthoptic training is instituted when the eyes are straight, in an effort to teach correct visual habits.

The Orthoptic Clinic of the Massachusetts Eye and Ear Infirmary was opened in 1942, under the direction of Dr. Edwin B. Dunphy, Chief of Ophthalmology. The department has grown steadily since its establishment. In 1948, in conjunction with Simmons College, a training school for orthoptic technicians was started. Since that time, eleven students have successfully passed the examinations of the American Orthoptic Council.

Originally the Orthoptic Clinic cared only for those registered as out patients; but last year a private clinic was begun, as well, to which members of the visiting staff have sent their patients. It is a rule that all clinic patients with squint must have an orthoptic work-up before being subjected to surgery. The final decision as to the disposition of the case rests, of course, with the chief of the clinic, but the orthoptist can help him tremendously by working patiently with the child and evaluating any defects in his binocular ability.

Ann E. Stromberg,
Orthoptist

Brief bits:—

Dr. Edward B. Benedict attended the meetings of the American Gastroenterological Association, held in San Francisco on June 18 and 19, and discussed the following papers: "Gastric carcinomas missed", by Dr. F. E. Templeton, and "The differential diagnosis of ascites and its surgical management", by Dr. Jere W. Lord, Jr. On June 20, Dr. Benedict attended the meeting of the American Gastroscopic Society in San Francisco and presented a paper titled "Massive hemorrhage from gastritis".

Dr. Patricia H. Benedict attended the meeting of the Endocrine Society in San Francisco on June 17 and presented a paper entitled "Amenorrhea with normal follicle-stimulating hormone (FSH): Follow-up report on 60 cases".

Dr. Edward F. Bland has returned from Europe, where he attended the International Conference on Thrombosis and Embolism, in Basel. In collaboration with Drs. Gordon Scannell and Gordon Myers he presented a paper on "Mitral commissurotomy and appendage amputation for recurring embolism".

Arnold F. Brodie, Ph.D. has resigned as Research Fellow in Biochemistry, to join the Department of Bacteriology at Harvard Medical School.

Dr. Anne P. Forbes, assistant to Dr. Fuller Albright, has left the United States with her family, to spend a year in Paris.

Albert W. Frenkel, Ph.D., Research Fellow in Biochemistry, has resumed his permanent position as Professor in the Department of Botany at the University of Minnesota.

Dr. Parker Heath, Jr. (a.r.p. 1954) announces the opening of his office for the practice of Internal Medicine at 22 White Street, Rockland, Maine.

Janey H. Park, Ph.D., Research Fellow in Biochemistry, has assumed a position in the Department of Physiology at Vanderbilt University in Tennessee.

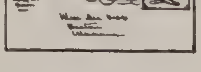
Rosalind V. Pitt-Rivers, Ph.D. has tendered her resignation as Visiting Biochemist and returned to England to resume her position at the National Institute of Medical Research, in London.

Dr. Stuart Ragland, Jr. (*M.* 1951) is now an Associate in Medicine at the Medical College of Virginia, in Richmond, engaged in part-time teaching and research.

John L. Wood, Ph.D. has finished his assignment as Research Fellow in Biochemistry and has resumed his permanent position as Head of the Department of Chemistry at the University of Tennessee.

New addresses:—

Dr. James M. Davis (*S.* 1948), Oteen Veterans Administration Hospital, Oteen, N. C.
Dr. Richard R. Evans (*Path.* 1944), Department of Allergy, Cleveland Clinic, 2020 East 93d St., Cleveland 6, Ohio
Dr. Peter L. Hurst (clin. & res. fel. *C.M.* 1954), Kaiser Foundation Northern Hospitals, Vancouver, Wash.
Dr. Charles S. Keuper (r.p. *D.* 1951), 270 Commonwealth Ave., Boston, Mass.
Dr. George H. Lawrence (*W.S.* 1947), Barnes Hospital, St. Louis, Mo.
Dr. John E. LeDonne (r.p. *D.* 1952), 357 Essex St., Salem, Mass.
Dr. Alexander S. Macmillan, Jr. (r.p. *R.* 1953), Peter Bent Brigham Hospital, Boston, Mass.
Dr. Norman Paul (clin. fel. *N.*), 31 Barberry Rd., Lexington, Mass.
Dr. Stuart Ragland, Jr. (*M.* 1951), 3540 Floyd Ave., Richmond, Va.
Dr. Leon Reznick (r.p. *D.* 1954), 270 Commonwealth Ave., Boston, Mass.
Dr. William P. Rogers, Jr. (clin. a. *S.*), 264 Beacon St., Boston, Mass.
Dr. Boris Senior (*C.M.* 1950), Medical School, Mowbray, Cape Town, South Africa
Dr. Adney K. Sutphin (*W.M.* 1943), 1805 Monument Ave., Richmond, Va.
Dr. Robert H. Walker (a.r.p. *Path.* 1951; a.r.s. 1953), Medical Arts Bldg., Calgary, Alberta, Canada
Dr. Jan Wolff (*M.* 1954), 25 Bay Wood Ave., San Anselmo, Calif.



Dr. Ronald C. Bishop (*M.* 1945)—another "singleton"—has sent us this interesting letter:

Your request for a letter from me has been lying on my desk, unanswered, too long.

First of all, I don't think I deserve the distinction of "singleton". I think I got it only because I put the E in front of the Ann Arbor. This merely means that I live three miles east of Ann Arbor. I really am a part of the Ann Arbor medical community, in which there are several other MGH-ers.

At present I am in the Department of Internal Medicine of the University of Michigan. My base is at the Simpson Memorial Institute where we do mainly Hematology. My teach-

No. 52 in a series of Staff photographs
Dr. Mahlon B. Hoagland—Associate Biochemist in Medicine and newly appointed Assistant to the General Director for Research and Education

ing duties consist of helping with the second year course in laboratory diagnosis and helping some with the fourth year students in their Medicine.

My hematology interests have led to several little side lines. My main hobby is iron metabolism. Most recently I have been working with radioactive iron, watching patients incorporate the tagged iron into hemoglobin, etc. We are also working with cobalt-60 tagged vitamin B_{12}, evaluating absorption under various conditions.

As of July 1, I was promoted to the rank of Assistant Professor in the Medical School. This carries with it a little more financial support than we have had, even though the work goes on about the same.

Our fourth, Andrew Lloyd, was born on June 28. This makes two girls and two boys for us. I don't know which, if any, will be coming MGH way in the future.

We enjoy The News a lot.

Regards to all at the General.

This friendly letter has come from Dr. Edwin C. Hoodless (a.r.s. *Or.* 1952)—our "singleton" up in Victoria, British Columbia:

I am afraid I haven't very much of interest to relate, other than that practice is progressing very satisfactorily here in Victoria. I am limiting my work to referred orthopaedic surgery. I have done this mainly because Victoria is not a large city (110,000), and the general practitioners have for years done all their own surgery, so I felt that if I opened an office and received patients directly from the street I would be in competition. Now they know when I see a patient for them that the patient goes back to them when I am finished with him.

I have not felt that I could afford a great deal of time for any hobbies, which would be boating. However, you might have heard of Flo Chadwick, who was out here for a month this summer in preparation to swim the Strait of Juan de Fuca. I was along with the official boat the day she attempted the swim, and although she was in the water for five hours, she swam only about four miles off shore because of the extremely severe tides.

My family and I sincerely miss Boston, although we don't like your hot summers. You can be assured that any holidays we take, we will come back to M.G.H. for a visit.

Dr. Walter A. Thompson (r.p. *Psychiat.* (McLean) 1931), who has been a "singleton" at his previous address, may find he is in the same category in his new location. We cannot be sure until the 1955 Directory is compiled. However, from Pinewood, Katonah, N. Y., Dr. Thompson writes:

First, I shall clear up my address. You have it as Rockland State Hospital, Orangeburg, N. Y. I left that hospital after the war, and am now the clinical director of the above hospital.

My home address is 714 Ackerman Avenue, Glen Rock, New Jersey, but within a month or two it will be Pockahoe Drive, Sleepy Hollow Manor, North Tarrytown, N. Y. I expect my new home to be completed there at the latest by the end of October.

I hope that in Tarrytown I will still be a "singleton".

A letter from Dr. Hervey L. Smith (*W.M.* 1907), our "singleton" in Palm Beach, Florida, appeared in the September issue of The News. Since then, this very cordial postscript has arrived from Dr. Smith:

Thank you so much for publishing my letter. I was afraid you would think I was boosting Florida too much. However, Palm Beach is a very lovely place, and just right for the retired.

And, if by chance or otherwise, you or any of the MGH family happen to be in Florida this coming winter, don't pass me by.

♣ ♣ ♣

The Hospital is soon to be favored by a very special art show. Paintings and etchings by Jan Gelb, well-known New York and Provincetown artist, will be on exhibition in the Brick Corridor during the first two weeks in November.

To justify the use of that word "special" as descriptive of the coming show, we give you a brief outline of this artist's work and the recognition she has received, as known to us—personally—over a period of several years.

Jan Gelb received her earliest training at Yale University School of Fine Arts, where she was awarded prizes for merit and progress, and in anatomy. Later, she worked and studied at the Art Students' League, the National Academy, and other art schools. She also received private instruction in this country and in France. Her work has been exhibited at the Metropolitan Museum Watercolor Show in 1952, the Whitney Museum Painting Annuals from 1951 through 1953, the Pennsylvania Academy in 1952, the Brooklyn Museum, the Library of Congress, the Philadelphia Print Club, and other exhibitions going way back to the National Academy in 1929. She is listed in *Who's who in the East* and *Who's who in American art.* Her techniques include oil, tempera, water color, etching, lithography, and fresco. She has developed her own flexible gessoed paper, usable with oils. Her work has been presented at solo shows in many galleries in this country, and she is represented in the permanent collection of the Metropolitan Museum of Art.

Everyone who attended the Boston Art Festival in the Public Gardens in 1953 will remember the painting by Jan Gelb which received Second Prize. We can now look forward to our own little private showing of some of her latest work.

THE ROBERT W. LOVETT MEMORIAL RESEARCH UNIT

STUDIES PERTAINING TO CONNECTIVE TISSUE AND ITS DISEASES*

The last three years have been exciting ones for the group interested in the connective tissue diseases. The introduction of new techniques to probe further the physiology and reactivity of connective tissue and the addition of enthusiastic new recruits to our ranks have stimulated the "old hands" in their continued pursuit of long-term objectives.

The most significant recent event in the history of the group has been the opening of our full floor of laboratories in the new Research Building of this Hospital. The staffing of many of these laboratories with investigators trained in the fundamental sciences has had some interesting effects—first, considerable shyness and even a little suspicion on the part of clinicians and fundamental investigators, then (as the complexities of modern biophysical, biochemical, and analytical techniques were revealed) the clinicians experienced an inferiority complex. This did not last long, because it was soon realized that the fundamental scientists, all motivated by a sincere desire to see their work reach useful application, desired clinical corroboration regarding the many problems of mutual interest. Soon an occasional clinical fellow, like Drs. Allan Dixon and Alex Muller, found full-time places at the laboratory bench, while Dr. Karl Schmid, the protein chemist, found himself following with great excitement the reticulocyte count in a patient with pernicious anemia.

With a physician-biologist, Dr. Jerome Gross, heading the biology unit, and a physician-biochemist, Dr. Evan Calkins, taking Dr. William S. Clark's place in the clinical unit, the two approaches to the study of connective tissue diseases have been integrated. A series of conferences in which each member presents his work to the group for critical appraisal, and the continuation of the weekly seminars, given partly by outside speakers, have facilitated greatly the interchange of ideas and methodology, with the result that both the fundamental and the clinical studies have benefited by this dual approach.

Fundamental studies

Drs. Gross, Jeanloz, and Soodak have continued with the studies which were outlined in the 1951 and 1953 reports in The News.

Dr. Gross has continued his studies on the mechanisms of fibrogenesis of collagen and the isolation and characterization of the precursors of this fibrous protein. Of considerable interest is the extraction of collagen from whole fresh connective tissues by cold physiological salt solutions and its precipitation in the test tube under physiological conditions in the form of typical native collagen fibrils as determined by electron microscopy and chemical analyses. From these and related studies, Dr. Gross and his colleagues believe they have characterized one of the fundamental building blocks of collagen fibrils. Studies are in progress on the defect in collagen formation in scurvy, an example of a controllable metabolic connective tissue disorder, and on the metabolic activity of the salt-soluble collagens of vertebrate connective tissues. He is also investigating other biological systems in which connective tissue can be synthesized and degraded in a controlled manner under the influence of hormones, vitamins, etc., so that such systems may be used by the other members of the groups in independent but cooperative studies on all the components of the connective tissue and the mechanisms that control their formation and degradation. It is hoped that such studies will provide fundamental information on which to base a rational attack on such things as aging processes, physiological functions of connective tissue and its alterations in certain degenerative disease processes.

Dr. Jeanloz has continued to study the structure and reactivity of polysaccharides containing amino sugars which constitute important components of ground substance and synovial fluid. His structural studies have included a synthesis of a series of 14 possible methylated glucosamines and galactosamines, with a comparison of their properties with those of the methylated degradation products of hyaluronic acid. Several more of these methylated hexosamines have been synthesized and others are under study. In addition, some progress has been made in the introduction of a radioactive labeled carbon in position 6 of glucosamine. This should provide an invaluable tool for studying the physiology and metabolism of this ubiquitous compound. Drs. Stoffyn and Jeanloz have devised a method to separate, identify, and estimate minute amounts of glucosamine and galactosamine by paper chromatography and a study of the mucopolysaccharides, using this procedure, is under way.

Elucidation of the enzymatic mechanism for the synthesis of hexosamines from glucose, for their oxidation, deamination, acetylation, and phosphorylation, and especially for the biosynthesis of mucopolysaccharides and glycoproteins, is the objective of Dr. Morris Soodak. At present he is engaged in studying the enzymes found in extracts of B. coli which phosphorylates N-acetyl glucosamine. He is also attempting to study the reactions of uridine diphosphate N-acetyl glucosamine and uridine diphosphate glucuronic acid, two substances believed to be intermediate in the synthesis of mucopolysaccharides.

Since the last report, the group has been fortified by the coming of Dr. Karl Schmid to head the protein research unit. Formerly of Dr. E. J. Cohn's department at Harvard Medical School, Dr. Schmid is investigating the precise chemical structure of a typical glycoprotein, acid glycoprotein, which he has isolated in crystalline form from normal human blood. He is emphasizing the structure of the polypeptide moiety, while Dr. Dixon, working in Dr. Jeanloz's laboratory, has separated, identified, and estimated quantitatively the neutral sugars and amino sugars. Dr. Schmid is also characterizing glycoproteins isolated from connective tissue, synovial fluid, and Wharton's jelly.

Dr. Robert Giles and Dr. Calkins are attempting to apply techniques such as those mentioned above to a study of amyloid and other extracellular deposits. (Amyloidosis is a complication encountered in approximately one-third of all rheumatoid arthritis patients.) Amyloid obtained from patients, in varying degrees of purity, has been chemically characterized as being 90 percent protein and roughly 1.5 percent hexosamine. Whether the hexosamine is present as a mucopolysaccharide or as a mucoprotein is still under study. In addition, attempts to produce this condition experimentally by serial injection of antigens into rabbits and mice are under way.

Dr. David Kahn, our pathologist, continues to collaborate in many of the group's clinical and physiologic studies. Notable among these is a study of nodule formation and the characteristics of skin and subcutaneous tissue in the elbow area, often occupied by nodules. He is also studying the pathology of finger joints in advanced rheumatoid arthritis.

Before entering the Army Medical Corps, Dr. Kulka, our former pathologist, completed a comprehensive study of early articular lesions in rheumatoid arthritis. On the basis of these findings, we now have added information which strongly suggests that vascular inflammation may be the initial lesion in rheumatoid arthritis and related diseases. This will be followed up by a chemical and molecular characterization of small blood vessels in the hope of obtaining confirmation of this finding.

---

*This is Publication Number 169 of the Robert W. Lovett Memorial for the Study of Crippling Diseases, Harvard Medical School. These studies have been made possible by generous grants from the Commonwealth Fund, New York, since January 1, 1938.

Dr. Louis Dienes continues to pursue the relationship between L organisms and bacteria. The recent isolation by Dr. John Sharp of an L form of group A hemolytic streptococci from eight strains has added enormous stimulus to this work. In view of the known role of L forms in causing arthritis in animals and the not infrequent association of streptococcal infections with rheumatic fever and rheumatoid arthritis, the possible etiological importance of this observation is of great significance. The fastidious nutritional requirements of most of the L forms, as compared to those of the bacteria, have been the subject of a special study by Dr. Sharp and Dr. Dienes. They have discovered that an increase in the sodium chloride content to a range of 1.5 to 6.0 percent in the medium will permit the growth of these L forms.

Clinical studies

One example of the use of new techniques to attack an old problem is the use by Dr. Allan Dixon of combined Evans-Blue dye and radioactive sodium chromate tagged red blood cells in determining to what extent the anemia of rheumatoid arthritis is a true anemia and to what extent it represents hemodilution. The discovery that 10 women patients with active rheumatoid arthritis displayed an average 21.6 percent increase in plasma volume and a 6.2 percent decrease in red cell volume as compared with 10 normal women, matched for age, suggests that hemodilution is at least one factor which is usually not considered in studies on the mechanism of the anemia of this disease. These data were extended by serial measurements of plasma volume and red cell volume, in cooperation with Drs. Calkins and Mitchell, in one patient with active rheumatoid arthritis both prior to and following abrupt cessation of cortisone therapy. Over the course of two weeks this patient displayed a fall in hematocrit from 46 to 34 percent, an associated increase in plasma volume, and a 6 percent decrease in red cell volume. Upon resumption of cortisone, the plasma volume returned to its former level within three days. These studies will be amplified during the coming year.

Another example of reinvestigation of an old problem by new techniques is the study of uric acid metabolism which was conducted by Dr. Alex Muller. For many years investigators have wondered, "Is gout due to an increased production of uric acid or to a decreased excretion?" Using a method for degrading and analyzing uric acid which he devised, Dr. Muller analyzed the incorporation of orally administered glycine, labeled with N^{15}, in the urinary uric acid excreted by patients with gout. The results, which agree with those simultaneously reported by Dr. DeWitt Stetten, showed that while in some patients there is definitely an increased rate of synthesis of uric acid, it is normal in others. Whether this represents two kinds of gout or two phases of the same disease remains to be established.

Dr. Ropes has extended her studies on synovial fluid physiology in two respects. She and Dr. Muller have investigated the mechanism of transfer of glucose from the blood to synovial fluid in various disease states in man and in normal calves, and compared these rates of transfer with those for galactose, a non-utilizable monosaccharide, pentoses, and methylated glucoses. These interesting data suggest that glucose and galactose are transported across the membrane in an active manner, presumably due to specific enzyme action. These studies also indicate that the rate of transport is decreased in joint disease. Further studies along this line are in progress in an attempt to elucidate the enzymatic reaction involved.

Dr. Ropes is also planning to undertake a study of the interrelationship between the glucosamine and the polysaccharides of synovial fluid responsible for its viscosity, in order to determine whether the denaturation of mucin in joint disease is due to breakdown or to incomplete synthesis of these polysaccharides. In this study, she will make use of techniques for chromatographic analysis of hexoses and hexosamines which have been worked out by Drs. Stoffyn and Dixon in Dr. Jeanloz's unit.

Dr. Ropes has also been studying the ratio of oxidized and reduced ascorbic acid in the blood of patients with rheumatoid arthritis. She has found that the percentage of oxidized ascorbic acid has been high in serum and synovial fluid in many individuals with active disease. In view of the known ability of the oxidized form of ascorbic acid to cause *in vitro* degradation of hyaluronic acid, this finding may have physiological significance. These studies are being extended, and the effect of massive doses of vitamin C in rheumatoid arthritis and amyloidosis is being observed.

The mode of action of aspirin in rheumatoid arthritis has never been disclosed. We have good reason to believe that aspirin has a very real effect on water and electrolyte metabolism. Furthermore, the observation that one of our patients with active arthritis, while on aspirin therapy, excreted significant amounts of homogentisic acid in his urine, in addition to gentisic acid, the usual breakdown product of aspirin, has called up many questions concerning the metabolism of this drug in both patients with active arthritis and normal subjects. To find the answers, Drs. Bachman and Calkins, in cooperation with Dr. DuToit of the Massachusetts General Hospital Chemistry Laboratory, are undertaking a pilot study of these problems.

Steroids

The introduction of ACTH and cortisone as therapeutic agents in the treatment of rheumatoid arthritis in 1949 led to a flurry of clinical trials, then chemical observations, and more recently to fundamental studies aimed at determining the mode of action of these agents. Our initial observations were outlined in THE NEWS of June 1950. More recent studies have centered around the question: "What are the consequences of prolonged cortisone administration?" These studies have been stimulated by our clinical experiences with 40 patients receiving long-term cortisone treatment. The total incidence of serious complications has been impressive: Three patients became psychotic; two of the three were receiving large doses of cortisone (greater than 125 mg. a day). Two patients sustained pathological fractures. Six patients developed severe infections. Of these, one died in adrenal insufficiency; a second, who also developed adrenal insufficiency, was revived following the intravenous administration of hydrocortisone. One patient died with pneumonia and symptoms suggesting adrenal insufficiency five months after the cessation of cortisone. Of two patients with diabetes, one became very much worse and could not be controlled with insulin and a second developed diabetic neuropathy including miliary aneurysms. One patient developed very severe hypertension.

Careful evaluation of these clinical experiences has yielded a great deal of information concerning the selection of patients for steroid therapy and safeguards against such complications. The institution of the latter has reduced the incidence of complications in patients currently receiving steroid treatment.

Drs. Lincoln Clark and Gardner Quarton have studied these patients from the psychiatric point of view; many of their observations have been published. This work has continued under Dr. Quarton's direction, and has consisted of trials of intensive psychotherapy in selected patients. In addition to several patients with clear-cut rheumatoid arthritis, one patient with a severe hysterical character structure and possible rheumatoid arthritis was studied intensively to clarify the differential diagnosis. On several occasions this patient was hypnotized, and her characteristic joint pains were both induced and removed by suggestion. The study of one case of lupus erythematosus disseminatus with extensive joint involvement revealed a rather dramatic relationship between emotionally disturbing episodes and exacerbations of symptoms. Other patients have been seen more superficially in the weekly Arthritis Clinic. A weekly research meeting has been held with psychiatrists and social workers working with children with arthritis. This was done not only to develop a research design for studying arthritic children, but also to compare and coordinate hypotheses arising from work with both children and adults. Unfortunately, Dr. Quarton has been called to active duty in the Naval Medical Corps for at least twelve months. Dr. Lincoln Clark has been on active duty with the Army Medical Corps since April 15, 1953. Because of the loss of these psychiatry colleagues, this phase of our work will proceed at a reduced tempo until they rejoin us. Once they return, we will reinvestigate the value of "group therapy" in the care of arthritis patients.
